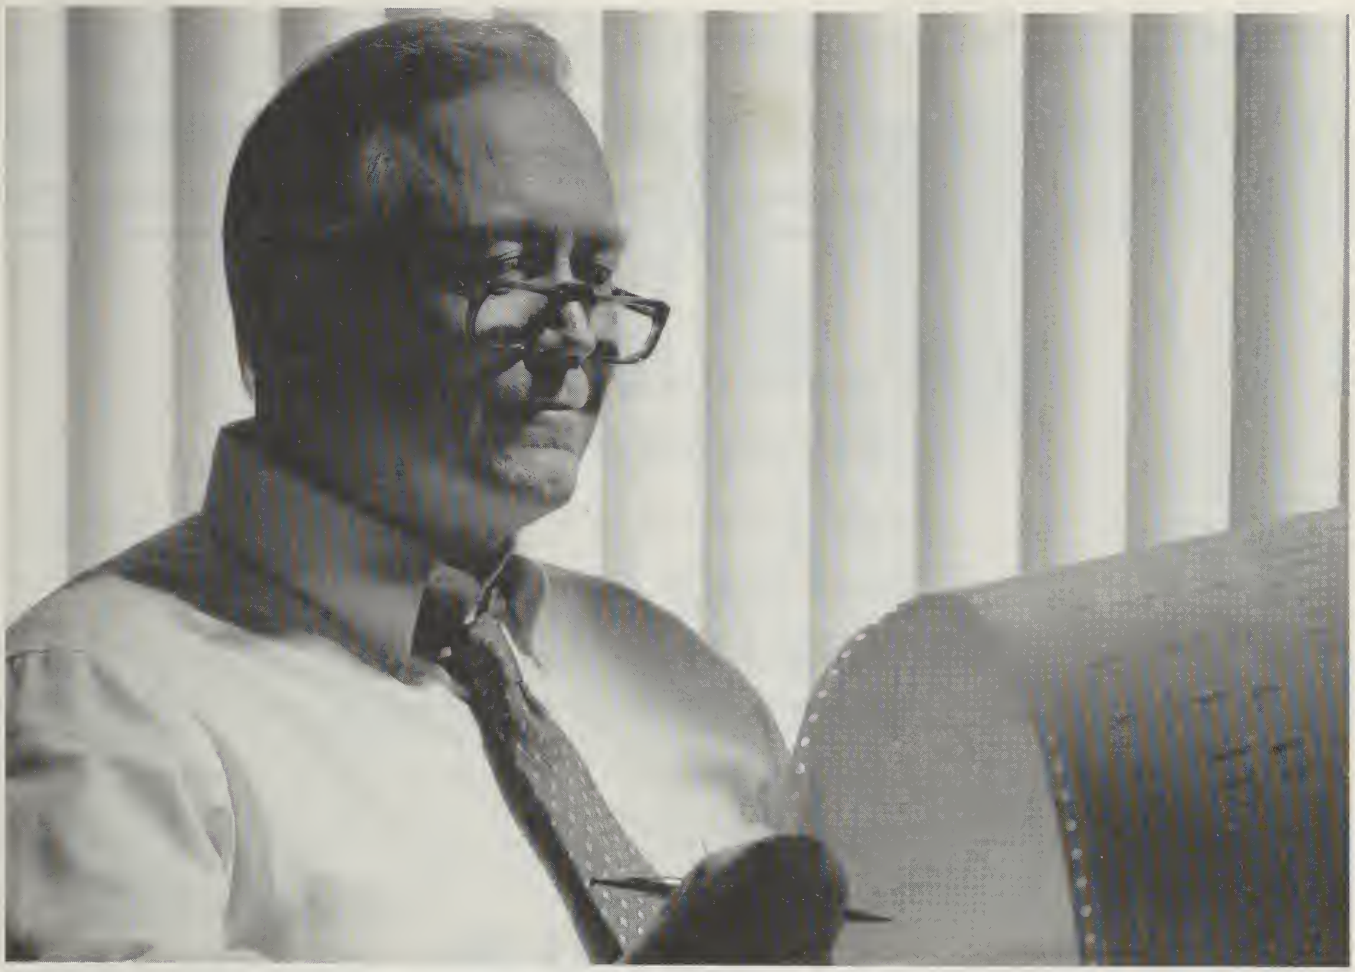
Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.



Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Frank J. Mayo, M.D., Pulmonologist

Sentient Systems offers total solutions. Hardware (IBM® and compatible), software, installation, data conversion, training, support and service are a part of every system. We provide the highest quality medical system available today. Just ask our customers.

For a free consultation call Sentient at:

ARTICLES

Antitrust's Recent Attack on the Peer Review Practitioner: Is the Health Care Quality Improvement Act a Viable Remedy? 21
Alan M. Rifkin, Esq., Gerard E. Evans, Esq., and Greg D. Hall, Esq.
Peer review, an increasingly important function in the hospital setting, is unique in that physicians are granted the task of evaluating and supervising the actions of their counterparts. Regardless of the consequences resulting from the peer-review system now operating within the hospitals, it will continue to be a mainstay until a more workable alternative is proved successful.

Med Chi . . . Our Best Defense in Annapolis 33
Angelo J. Troisi FACHE, Executive Director
Last September Med Chi's Council entered into a five-year contract with the law firm of Rifkin, Evans, Silver, and Lamone. The contract requires the firm to provide legislative and legal advice on all matters facing the Faculty.

The Epidemiology of AIDS in Maryland, 1981 - 1987 83
Joseph T. Horman DVM, MPH; Ebenezer Israel MD, MPH; and Gillian Ann van Blerk MD, MPH
From 1981 through 1987, a total of 1,068 AIDS cases were diagnosed in Maryland; 62.8 percent occurred in the homosexual/bisexual male cohort followed by intravenous drug abusers, 21.8 percent. Time trends suggest that proportionally fewer cases of AIDS will occur among homosexual/bisexual males and transfusion patients, and more cases will appear among intravenous drug abusers and heterosexuals.

Along with an updated legislative directory, this year's annual legislative issue of the *Maryland Medical Journal* contains four faculty position papers written at the request of Med Chi's president, Raymond M. Atkins MD. These "white papers" are the product of Med Chi committee consensus and have been amended and adopted by Council. We publish them here for your information and use.

The article by Rifkin, Evans, and Hall stating that most hospitals have an excellent peer-review process in place, urges peer-review groups to consult with the hospital's board of trustees to consider whether some form of the HCQIA due-process guidelines is available to medical staff members and whether the hospital's insurance coverage provides antitrust protection to peer review participants.

In the final legislative article, Angelo Troisi describes the wealth of talent available to Med Chi members from the combination of legal, legislative, and political experience encompassed in the law firm of Rifkin, Evans, Silver, and Lamone.

Occurrence-Type Malpractice Coverage Is A Physician's Best Protection During Bad Times

Most physicians have in some way been affected by the last decade's volatile malpractice insurance market. Huge premium increases, restrictions on lateral changes from one insurer to another, and the ever-present threat of large "tail" costs forcing physicians to stay put, like it or not, are all part of recent malpractice insurance history.

Times are better now with malpractice insurers competing for your business. How long will it last? That is anyone's guess. Where is the best place to be insured when the pendulum swings the other way and prices rise again?

The answer is easy. All other things (policy terms, premiums and financial stability of the insurer) being equal, a physician's best protection against " bad times" is an occurrence-type policy. The reason is simple:

> With occurrence-type coverage, the company knows that the physician has complete mobility. If the company raises rates, the physician can leave to a less expensive insurer with no risk and no tail.
>
> With claims made coverage, the company can raise rates knowing that a physician will be reluctant to leave and incur a large tail cost.

Princeton Insurance Company provides the only occurrence - type policy offered in the State of Maryland. This competitively priced policy can be purchased without incurring a large up-front cost for prior acts coverage. The company is financially sound and insures over 500 Maryland physicians and 3 Maryland hospitals.

For a written quotation comparing Princeton's coverage to your policy, complete the form below and return it to us with a copy of the Declarations pages of your current policy. You need a broker you can rely on. *It is not too late to choose. If your policy renews on January 1st, you have until January 30th to change your mind and obtain a full refund from that insurer. Check with us for your best buy in today's market.*

Current Treatment Guidelines for Sexually Transmitted Diseases

The Centers for Disease Control published updated treatment guidelines for Sexually Transmitted Diseases (STD) in Morbidity and Mortality Weekly Report, September 1, 1989 Vol. 38, No S-8. In this issue we will provide the treatment guidelines for early syphilis, late latent, cardiovascular syphilis and neurosyphilis, and a protocol for syphilis diagnosis and treatment. In future issues we will provide treatment guidelines for congenital syphilis, syphilis in pregnancy, and several other commonly occurring STD's. The 1989 Sexually Transmitted Diseases Treatment Guidelines are being reprinted and will be available in 4-8 weeks. Interested health care providers may obtain copies by contacting their local health department.

Syphilis

Serologic Tests

Dark-field examinations and direct fluorescent antibody tests on lesions or tissue are the definitive methods for diagnosing early syphilis. Presumptive diagnosis is possible by using two types of serologic tests for syphilis: 1) treponemal (e.g., fluorescent treponemal antibody absorbed [FTA-ABS], microhemagglutination assay for antibody to T. pallidum [MHATP] and 2) nontreponemal (e.g., Venereal Disease Research Laboratory [VDRL], rapid plasma reagin [RPR]. Neither test alone is sufficient for diagnosis. Treponemal antibody tests, once positive, usually remain so for life, regardless of treatment or disease activity. Treponemal antibody titers do not correlate with disease activity and should be reported as positive or negative. Nontreponemal antibody titers do tend to correlate with disease activity, usually rising with new infection and falling after treatment. Nontreponemal antibody test results should be reported quantitatively and titered out to a final end point rather than reported as greater than an arbitrary cutoff (e.g., 1:512). With regard to changes in nontreponemal test results, a fourfold change in titers is equivalent to a two-dilution change - e.g., from 1:16 to 1:4, or from 1:8 to 1:32.

For sequential serologic tests, the same test (e.g., VDRL or RPR) should be used, and it should be run by the same laboratory. The VDRL and RPR are equally valid, but RPR titers are often slightly higher than VDRL titers and therefore are not comparable.

Neurosyphilis cannot be accurately diagnosed from any single test. Cerebrospinal fluid (CSF) tests should include cell count, protein, and VDRL (not RPR). The CSF leukocyte count is usually elevated ($5 \geq$ WBC/mm^3) when neurosyphilis is present and is a sensitive measure of the efficacy of therapy. VDRL is the standard test for CSF; when positive it is considered diagnostic of neurosyphilis. However, it may be negative when neurosyphilis is present and cannot be used to rule out neurosyphilis. Some experts also order an FTA-ABS; this may be less specific (more false positives) but is highly sensitive. The positive predictive value of the CSF-FTA-ABS is lower, but when negative, this test provides evidence against neurosyphilis.

Early Syphilis

Primary and Secondary Syphilis and Early Latent Syphilis of Less than 1 Year's Duration

Recommended Regimen

Benzathine penicillin G. 2.4 million units IM, in one dose.

Alternative Regimen for Penicillin-Allergic Patients (Nonpregnant)

Doxycycline, 100 mg orally 2 times a day for 2 weeks ,

or

Tetracycline, 500 mg orally 4 times a day for 2 weeks

Doxycycline and tetracycline are equivalent therapies. There is less clinical experience with doxycycline, but compliance is better. In patients who cannot tolerate doxycycline or tetracycline, three options exist:

* If follow-up or compliance cannot be ensured, the patient should have skin testing for penicillin allergy and be desensitized if necessary (see MMWR, Vol. 38, No. S-8, 9/1/89).
* If compliance and follow-up are ensured, erythromycin, 500 mg orally 4 times a day for 2 weeks, can be used.
* Patients who are allergic to penicillin may also be allergic to cephalosporins; therefore, caution must be used in treating a penicillin-allergic patient with a cephalosporin. However, preliminary data suggest that ceftriaxone, 250 mg IM once a day for 10 days, is curative--but careful follow-up is mandatory.

Follow-Up

Treatment failures can occur with any regimen. Patients should be reexamined clinically and serologically at 3 months and 6 months. If nontreponemal antibody titers have not declined fourfold by 3 months with primary or secondary syphilis, or by 6 months in early latent syphilis, or if signs or symptoms persist and reinfection has been ruled out, patients should have a CSF examination and be retreated appropriately.

HIV-infected patients should have more frequent follow-up, including serologic testing at 1, 2, 3, 6, 9, and 12 months. In addition to the above guidelines for 3 and 6 months, any patient with a fourfold increase in titer at any time should have a CSF examination and be treated with the neurosyphilis regimen unless reinfection can be established as the cause of the increased titer.

Lumbar Puncture in Early Syphilis

CSF abnormalities are common in adults with early syphilis. Despite the frequency of these CSF findings, very few patients develop neurosyphilis when the treatment regimens described above are used. Therefore, unless clinical signs and symptoms of neurologic involvement exist, such as optic, auditory, cranial nerve, or meningeal symptoms, lumbar puncture is not recommended for routine evaluation of early syphilis. This recommendation also applies to immunocompromised and HIV-infected patients, since no clear data currently show that these patients need increased therapy.

HIV Testing

All syphilis patients should be counseled concerning the risk of HIV and be encouraged to be tested for HIV.

Late Latent Syphilis of More Than 1 Year's Duration, Gummas, and Cardiovascular Syphilis

All Patients should have a thorough clinical examination. Ideally, all patients with syphilis of more than 1 year's duration should have a CSF examination; however, performance of lumbar puncture can be individualized. In older asymptomatic individuals, the yield of lumbar puncture is likely to be low; however, CSF examination is clearly indicated in the following specific situations:

* Neurologic signs or symptoms
* Treatment failure
* Serum nontreponemal antibody titer $\geq$1:32
* Other evidence of active syphilis (aortitis, gumma, iritis)
* Nonpenicillin therapy planned
* Positive HIV antibody test

Note: If CSF examination is performed and reveals findings consistent with neurosyphilis, patients should be treated for neurosyphilis (see next section). Some experts also treat cardiovas-

cular syphilis patients with a neurosyphilis regimen.

Recommended Regimen

Benzathine penicillin G, 7.2 million units total, administered as 3 doses of 2.4 million units IM, given 1 week apart for 3 consecutive weeks.

Alternative Regimen for Penicillin-Allergic Patients (Nonpregnant)

Doxycycline, 100 mg orally 2 times a day for 4 weeks,

or

Tetracycline, 500 mg orally 4 times a day for 4 weeks.

If patients are allergic to penicillin, alternate drugs should be used only after CSF examination has excluded neurosyphilis. Penicillin allergy is best determined by careful history taking, but skin testing may be used if the major and minor determinants are available (see MMWR, Vol 38, No S-8, 9/1/89).

Follow-Up

Quantitative nontreponemal serologic tests should be repeated at 6 months and 12 months. If titers increase fourfold, if an initially high titer ($\geq$1:32) fails to decrease, or if the patient has signs or symptoms attributable to syphilis, the patient should be evaluated for neurosyphilis and retreated appropriately.

HIV Testing

All syphilis patients should be counseled concerning the risks of HIV and be encouraged to be tested for HIV antibody.

Neurosyphilis

Central nervous system disease may occur during any stage of syphilis. Clinical evidence of neurologic involvement (e.g., optic and auditory symptoms, cranial nerve palsies) warrants CSF examination.

Recommended Regimen

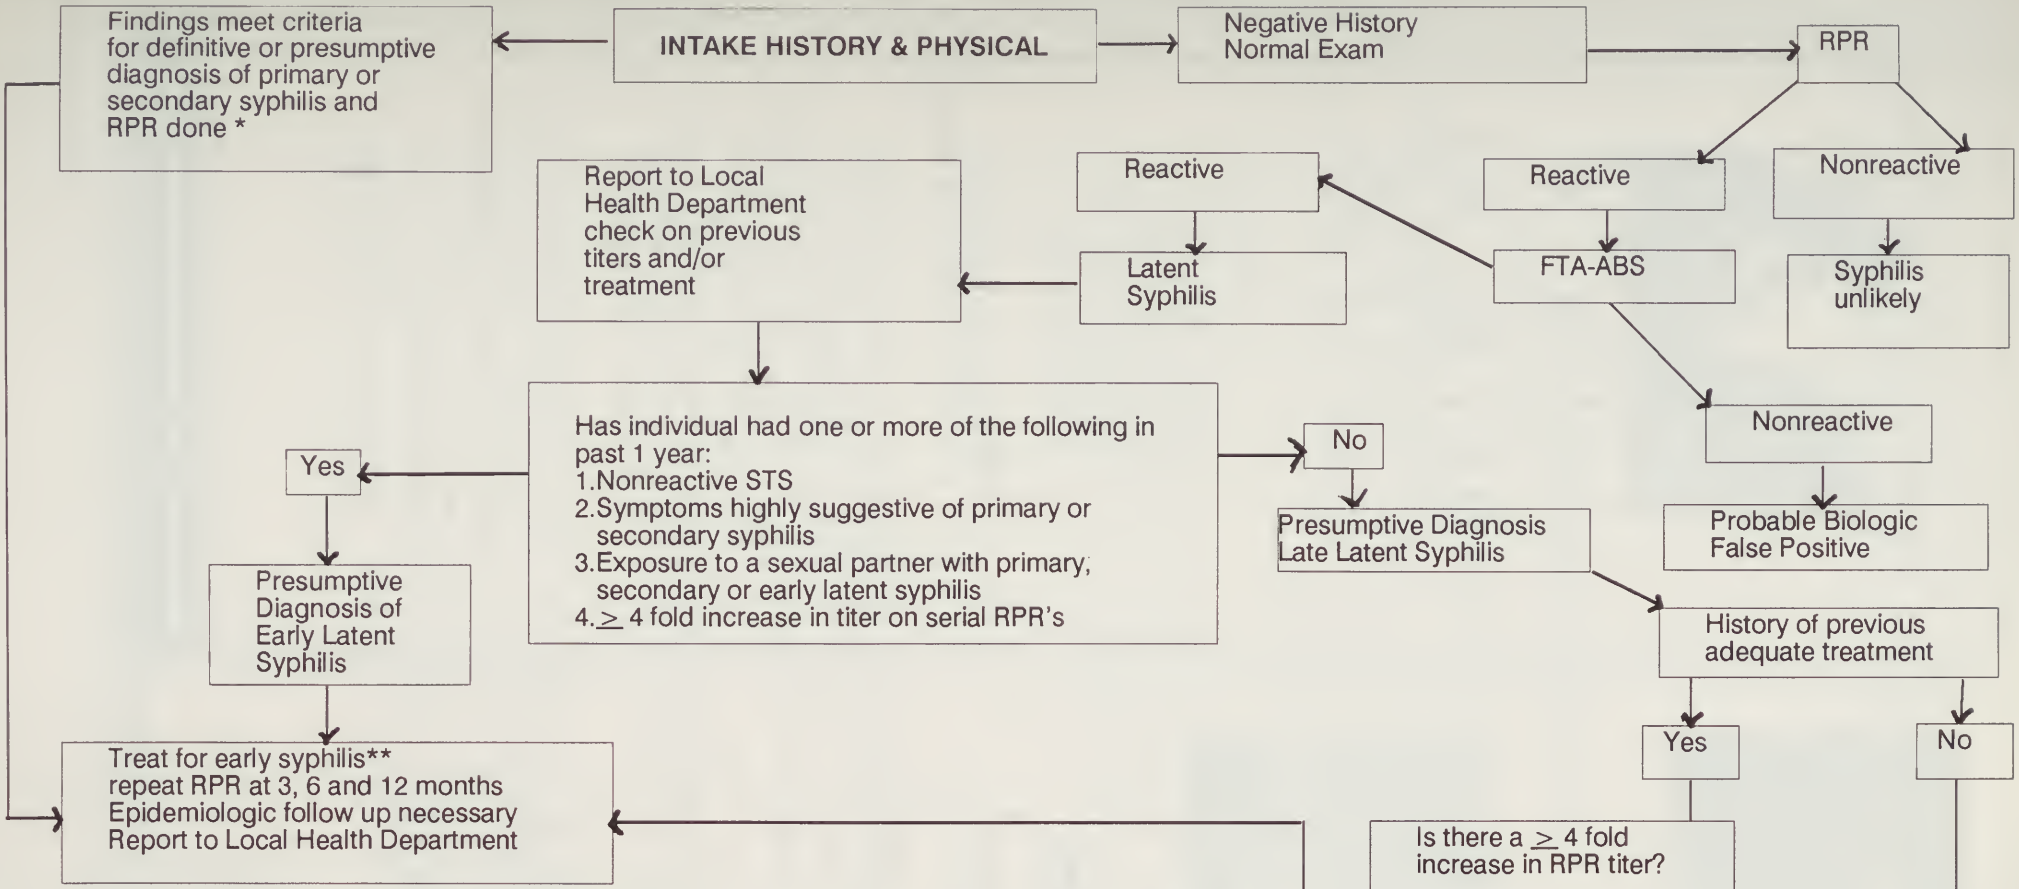
Aqueous crystalline penicillin G, 12-24 million units administered 2-4 million units every 4 hours IV, for 10-14 days.

Alternative Regimen (If Outpatient Compliance Can Be Ensured)

Procaine penicillin, 2.4 million units IM daily and Probenecid, 500 mg orally 4 times a day, both for 10-14 days.

Many authorities recommend addition of benzathine penicillin G, 2.4 million units IM weekly for three doses after completion of these neurosyphilis treatment regimens. No systematically collected data have evaluated therapeutic alternatives to penicillin. Patients who cannot tolerate penicillin should be skin tested and desensitized, if necessary, or managed in consultation with an expert.

Follow-Up



If an initial CSF pleocytosis was present, CSF examination should be repeated every 6 months until the cell count is normal. If it has not decreased at 6 months, or is not normal by 2 years, retreatment should be strongly considered.

HIV Testing

All syphilis patients should be counseled concerning the risks of HIV and be encouraged to be tested for HIV antibody.

See next page for Protocol for Syphilis Diagnosis and Treatment

PROTOCOL FOR SYPHILIS DIAGNOSIS AND TREATMENT

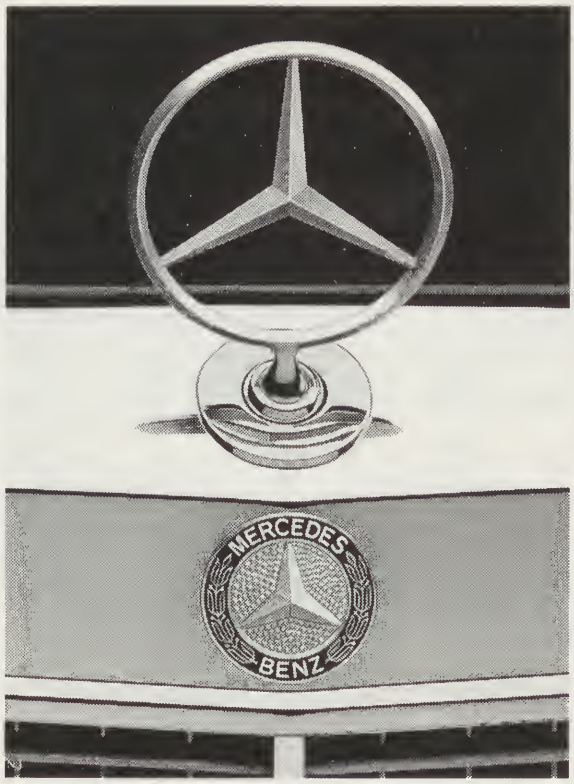
* from: Quality Assurance Guidelines for STD Clinics, 1986 USPHS, CDC

Criteria for primary syphilis

a. Definitive: Treponema pallidum demonstrated by darkfield microscopy or by Direct Fluorescent Antibody stain for T. pallidum (DFTAP) in material from a chancre or aspriate from a regional lymph node. (Use DFATP for oral lesions)

b. Presumptive: one or more typical lesions (chancres) and
   1) Reactive nontreponemal tests but no previous history of syphilis or reactive nontreponemal tests.
   2) The titer of the present nontreponemal test is ≥ 4 fold the last test.
   3) Lesions have appeared within 10 - 90 days of exposure to a partner with primary, secondary or early latent syphilis.

Criterial for secondary syphilis



a. Definitive: A postive nontreponemal test plus darkfield microscopic or DFATP demonstration of T. pallidum from skin lesions or lymph nodes.

b. Presumptive: A newly reactive serologic test or a ≥ 4 fold increase in titer over last known nontreponemal test plus signs of secondary syphilis (one or more may be present):
   1) Bilaterally symmetrical macular, papular, follicular, papulo-squamous, or pustular skin lesions
   2) Loss of eyelashes and lateral third of eyebrows
   3) Iritis
   4) Condylomata lata (moist papules usually in anogenital region or mouth)
   5) Mucous patches of the oropharynx or cervix
   6) Generalized lymphadenopathy
   7) Fever and malaise
   8) Splenomegaly

** Benzathine penicillin G 2.4 million units IM in a single dose

***Benzathine penicillin G 2.4 million units IM once a week for 3 consecutive weeks (Total dose 7.2 million units)

Consult 1989 STD Treatment Guidelines for management of penicillin allergic patients and patients with tertiary syphilis.

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to its members

Medical and Chirurgical Faculty of Maryland

January, 1990

Med Chi's Western Regional Conference

In an effort to improve communication between Med Chi and its membership, Med Chi held a Western Regional Conference on Saturday October 28, 1989 at the Hagarstown Ramada Inn. The meeting was hosted by Ramsay J. Farah MD, President of the Washington County Medical Society. Robustiano J. Barrera MD, President-Elect of Allegany County Medical Society, and several area physicians met with Executive Director Angelo Troisi, Lobbyist Gerard Evans, and myself to discuss issues concerning physicians in western Maryland.

One of the most important/ topics addressed was the white paper by Louis C. Breschi MD, which presents various situations concerning the appropriateness and inappropriateness of physicians involvement in business ventures. Many physicians also expressed their concern regarding upcoming legislation that would require triplicate prescriptions. Other topics discussed at the meeting included physician's credentialing, antitrust activities, and Medicare physician monitoring.

Raymond M. Yow MD, Chief Executive Officer, and David Murray, Chief Operations Officer of Medical Mutual, announced during the meeting that their company plans to offer a 20 percent dividend credit to all physicians who renew their policies in 1990. In addition, both executives responded to questions about common causes of litigation.

Following lunch, Plenary Speaker Robert Vogel MD, Chief of Cardiology at the University of Maryland School of Medicine, delivered an excellent presentation on Cholesterol.

This meeting was the first of three Med Chi Regional Meetings planned during my term as President. Dates for meetings in Southern Maryland and the Eastern Shore will be announced later this year. My goals are to bring as much information as possible to physician members and to provide an open forum where the Faculty can effectively transmit its activities and accomplishments and Med Chi can become aware of the regional issues affecting the individual physician in his\her practice.

Raymond M. Atkins MD
President

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 581-1212. When it comes to curing practice management problems, we are the specialists.

CADO SYSTEMS — WE OFFER PRACTICE MANAGEMENT SOLUTIONS, NOT JUST COMPUTERS!

Inflammatory Carcinoma of the Breast: Part II

The early data on the management of patients with inflammatory carcinoma of the breast by mastectomy were very discouraging. Despite surgery being performed on patients with limited breast erythema and edema, their median survival ranged from 2.4 to 25 months with a five-year survival of 2.4 percent. In addition, there was a high incidence of local recurrence resulting in a fungating and ulcerating growth over the anterior chest wall. Therefore, the role of surgery in this disease became limited to the biopsy, which included a sliver of skin, subcutaneous tissue, and enough breast tissue for histopathological examination and hormonal receptors determination.

Radiation therapy then became the primary therapeutic approach in the management inflammatory carcinoma of the breast. Treatment with irradiation resulted in relatively better local control by reducing the incidence of skin ulceration, but it did not improve survival. The median disease-free survival ranged from four to six months, with a mean survival of about one year, and a five-year survival of less than 5 percent. In fact, very few patients survived beyond two years. The combination of surgery and radiation therapy also had been tried with no major impact on the outcome. Such combined treatment gave a median survival of about 18 months, with a five-year survival of 4 percent.

These poor results should have been expected because such an approach used two local-regional therapeutic modalities. As the disease tends to have an aggressive course, not only locally and regionally but also systemically, a more logical strategy is the use of systemic therapy in addition to the local-regional therapeutic modality.

Hormonal therapy combined with local irradiation was tried with no significant impact on the course of the disease. This can be expected as most inflammatory carcinomas are hormone receptor negative. Systemic chemotherapy followed by radiation therapy has been tried with some promising results. This combined approach has resulted in better local control and possible prolongation of survival.[1,2] In addition, it has been suggested that intensification chemotherapy and modern irradiation may further improve the survival.[2] However, there is some limitation to the use of radiation therapy in the management of large residual tumor after a few courses of induction chemotherapy.

In July 1976, we treated our first patient with inflammatory carcinoma with chemotherapy, then mastectomy, followed by chemotherapy with a good result.[3] Since then, we have reported on 13 other patients treated similarly by chemotherapy, mastectomy, and chemotherapy and have shown that such an approach is safe and possibly beneficial.[4] Other investigators have used the same approach and added radiation therapy at the end of the treatment with very promising results.[5,6]

More recently, we have treated 14 new patients: 10 with no distant metastases and 4 with distant metastases. The hormone receptors assayed on their primary tumors at the time of the biopsy and prior to the initiation of any therapy revealed: ER ranging from 0 to 18 fml/mg protein (median:0), and PR 0 to 71 fml/mgm protein (median:0). Over 80 percent of these patients had hormone receptor negative tumors.

Each patient was treated initially with three courses of three-drug combination chemotherapy. Each course consisted of 28 days, during which the patient received 14 days of treatment followed by 14 days of no therapy. Each course included cyclophosphamide 100 mg/m^2 intravenously on days one and eight of each course, and 5-fluorouracil 500 mg/m^2 intravenously also on days one and eight. Dose modifications were made for hematological toxicity.

After completing three courses of this initial chemotherapy, the patients were evaluated for local tumor response. Response was identified as the disappearance of all the skin erythema and edema with some reduction in the size of the tumor mass in the breast. The tumor also had to be mobile over the true chest wall.

Thirteen patients responded to the initial chemotherapy: 10 with no distant metastases and 3 out of 4 with distant metastases. All 13 patients underwent mastectomies after hematological recovery. Two to three weeks postoperatively chemotherapy was reinstated. The 10 patients without distant metastases received 9 more courses of the same combination chemotherapy, then were observed without further treatment. The 3 patients who responded to the initial chemotherapy and had distant metastases continued to receive the same combination chemotherapy without cessation.

The patient with distant metastases whose tumor did not respond to the initial 3 courses of combination chemotherapy was then treated by radiation therapy. She was then maintained on the same combination chemotherapy intensified by the addition of vincristine sulphate 1 mg/m^2 intravenously on days 1 through 8, and prednisone 40 mg/m^2 orally on days 1 through 14 of each cycle. When the total dose of doxorubicin hydrochloride of 540 mg/m^2 was reached, methotrexate was substituted at 40 mg/m^2 intravenously on days 1 and 8 of each cycle to avoid cardiac toxicity.

In case of recurrence or progression of the disease, the patients were treated with mitomycin-C and vinblastine, with or without radiation therapy as the case required. When they failed again, as evidenced by disease progression, they received phase I or II chemotherapeutic agents.

The survival data for the 10 patients who initially had no distant metastases revealed a disease-free survival that ranged from 5 to 58 months with a median of 30 months, and an overall survival that ranged from 7 to over 100 months with a median of 32 months. In this group seven had failed: 2 local recurrences, 2 supraclavicular areas, 2 skeletal, and one pleural. On the other hand, the overall survival of the four patients who had distant metastases initially ranged from four to 14 months.

Our overall results are similar to others that used comparable programs and irradiation.[5,6] Such findings suggest that an intensification chemotherapeutic program may yield better results.

SOCIAL SECURITY DISABILITY

Do you know what they require in a medical report?

If not, your disabled patients suffer.

- **PDS knows the requirements.** PDS will furnish checklists to focus your attention on questions that **must** be answered.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

Announcing a cure for the common computer.

Is your practice computer system chronically ill? Or perhaps you're just not getting access to the information you need? At MEDSOURCE, we have the expertise to diagnose and treat your data problems. Whether it's analyzing data for negotiation with HMOs, coordinating clinical research projects or tracking patient care, MEDSOURCE can provide you with healthy, accurate data every time.

We can assist you in the selection of medical record and accounting systems. We'll install new equipment and train your staff. We can even develop customized programs to help you make new use of existing data.

MEDSOURCE's 13 years of experience in computer programming and our in-depth knowledge of the clinical health care field make us the expert in computer systems for practice management. So, the next time you find yourself diagnosing your computer instead of your patients, call MEDSOURCE.

1990 - 1991 Committee Selection Cards Attached

Executive Director's Newsle

January 1990

1990 Annual Meeting

"The 1990s: What Can We Expect?" is the theme for Med Chi's Annual Meeting to be held on May 9-11, 1990 at Turf Valley Hotel and Country Club in Ellicott City, MD. Detailed information regarding this meeting will be published in this newsletter.

1990 Semiannual Meeting

The Semiannual Meeting is planned for September 5-9, 1990 at the Southampton Princess Hotel in Bermuda. Registration fee for Med Chi members is $500. In addition, price per person, double occupancy is $999, which includes airfare, four nights accommodations, and two meals each day. If you are interested in attending this meeting, it is essential that you contact the Convention Services Department for the Faculty to inform us of your interest. Deadline for reservations is April 1, 1990.

Med Chi Legislative Directory

Included in this issue is the *Med Chi Legislative Directory*, a reference book designed to familiarize physicians with the legislative process and their state representatives. The *Directory* includes lists of Senators and Delegates by committee and provides the addresses and telephone numbers for each legislator according to their county/city/district. Physicians are strongly encouraged to tear out their copy of the *Directory* and use this valuable resource throughout the legislative session.

Committee Selections for 1990-1991

Med Chi members interested in serving on committees in 1990 are reminded to complete the committee selection card that follows this newsletter. Physicians must return this card to the Faculty in order to be considered for appointment.

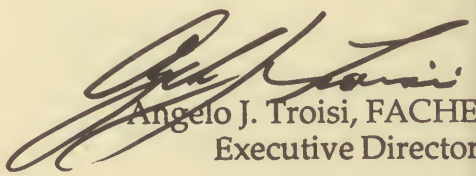
Resolutions

On November 16, 1989 the Med Chi Council resolved to oppose utilization review involving patient contact. The Council also approved the formation of a Task Force that will develop a proposal for a managed care system for psychiatric services that is acceptable to the Med Chi Insurance Fund.

AIDS

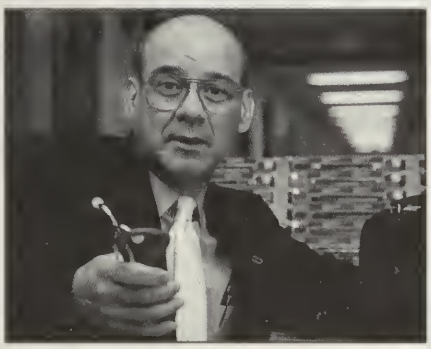
Physicians wishing to learn more about participating in treatment programs for additional AIDS and HIV patients may contact the AIDS Counselor at their county health department. Physicians are reminded that, as a result of the AIDS Omnibus Bill, the Board of Physician Quality Assurance may find a basis for action on any physician who does not treat an individual because the individual is HIV positive. (HO, Section 14-504(a)(30)). Med Chi and AMA policy both state that no physician has the moral or legal right to refuse treatment of a patient within the physician's current realm of competence solely because the individual is seropositive.

Attention



Every Maryland Physician should know that *The Maryland Medical Practice Act* has relatively new grounds for action that may be taken against a physician's license. Any physician who "sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes" is subject to license probation, suspension, or revocation. (HO, Section 14:504 (a)(28)). For further information on this issue, contact Greg Hall, Legal Counsel for the Faculty at 1-800-492-1056 or 301-539-0872 in Baltimore.

Physician Volunteer Projects



The AMA recently published a *Medical Society Guide to Physician Volunteer Projects* designed to provide medical societies with descriptions of volunteer and community service programs across the country. The *Guide* features an entry on Allegany Health Right, a project supported by the Allegany County Medical Society that provides health services to those with incomes too low for health insurance but too high for government aid. For a copy of the *Guide* contact Betsy Newman, Public Relations for the Faculty at 1-800-492-1056 or 301-539-0872 in Baltimore.

Governor's Drug Summitt

The Governor's fourth and final Drug Summitt, "Marylanders Taking Action Against Drugs," was held on November 28, 1989 at the Baltimore Convention Center. More than 1,000 people including Med Chi's Committee on Drugs Chairman, Nelson Goodman MD and Executive Director Angelo J. Troisi attended the conference and receivedcopies the Administration's proposed Drug Package for 1990. Med Chi is developing resolutions relative to this plan that are appropriate for Med Chi action.

Angelo J. Troisi, FACHE
Executive Director

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Antitrust's Recent Attack on the Peer Review Practitioner: Is the Health Care Quality Improvement Act a Viable Remedy?

Alan M. Rifkin, Esq., Gerard E. Evans, Esq., and Greg D. Hall, Esq.

Authors Rifkin and Evans are partners in the Baltimore-based law firm of Rifkins, Evans, Silver, and Lamone where Hall is an associate.

Peer review, an increasingly important function in the hospital setting, is unique in that physicians are granted the task of evaluating and supervising the actions of their counterparts. Regardless of the consequences resulting from the peer-review system now operating within the hospitals, it will continue to be a mainstay until a more workable alternative is proved successful.

As a result of the recent *Patrick v. Burget* decision[1] in the Supreme Court, health care practitioners (and attorneys who represent them) have expressed concern about potential antitrust liability associated with medical staff privilege decisions. Peer-review participants should realize, however, that *Patrick* is of limited scope, addressing only the state action protection available to Oregon peer-review practitioners. Of equal importance is the fact that the *Patrick* decision revolved around an egregious set of facts where peer-review participants failed to exercise "good faith" when reviewing Dr. Patrick's care.

Since its inception, peer review has served a vital function regarding the hospital's obligation to its patients. Through this mechanism, the hospital's medical staff and quality assurance committees assure the quality and appropriateness of patient care. The JCAHO (Joint Commission on Accreditation of Healthcare Organizations), state medical licensing and disciplinary agencies, and Medicare/Medicaid Conditions of participation all mandate forms of peer review to monitor and evaluate the level of care provided at each hospital facility. Peer review is essential, therefore, in controlling the type of care provided at institutions as well as the physicians practicing with them.

Peer review has become an increasingly important function in the hospital setting during the past 20 years.[2] It is unique in that members of the medical profession are granted the task of evaluating and supervising the actions of their counterparts. This has led to a great deal of controversy since physicians often are required to balance interest in quality hospital patient care against the fear of being ostracized or shunned by their fellow practitioners. Proponents of peer review contend that the practice of medicine is so specialized that physicians (or persons equivalently educated) are the only individuals knowledgeable enough to assess the treatment, skills, and abilities of other practitioners.[2] Critics of the process, however, maintain that it is similar to sending the fox to guard the chicken coop: doctors may be more interested in

preserving friendly ties with fellow physicians than insuring quality health care.[2] Regardless of the actual consequences resulting from the peer-review system presently operating within hospitals, it will continue to be a mainstay until a more workable alternative is proved successful.

We address the *Patrick*[1] decision as well as other cases involving antitrust implications associated with the peer-review process.

Peer Review: An Historical Background

To understand peer review and its current relationship to health care and the health care practitioner, it is essential to have an awareness of its development. To combat the problem of poorly instructed, and often incompetent, graduates of medical schools during the early 1800s, the American Medical Association (AMA) was founded in 1846.[3] Although the AMA did achieve some of its purported goals, the Flexner Report[4] issued in 1910 indicated the supply of physicians was in excess of that required to maintain a high degree of health care. As a result of that report, medical schools began graduating fewer students and instituted programs to better educate those students in attendance. In 1913, the American College of Surgeons (ACS) was organized to improve hospital quality of care through a program of more accurate medical recordkeeping. ACS also favored and promoted a system of staff membership based on merit and organized the various staffs into patterns a precursor to today's hospital department and committees.

Almost 40 years would elapse before the Joint Commission on Accreditation of Hospitals (JCAH) would form in 1952, establishing a system of standards for hospitals. Although its name has been changed to the Joint Commission on Accreditation of Healthcare Organizations (JCAHC), it continues to be the foremost authority in setting forth guidelines for the hospital industry. Today, Joint Commission standards as well as recent legislation and case law provide the foundation for determining the hospital's organization and concomitant responsibilities toward its patients.[2]

Peer review typically is designated as being either voluntary or mandatory. Voluntary peer review often focuses on the reasonableness or necessity of the services provided by the hospital. It commonly is conducted by an entity composed of professionals in the surrounding community, such as a county medical society. Mandatory peer review is necessitated when the hospital furnishes professional services that are financed by the public or government coffers.[5] This can range from the Medicare/Medicaid Conditions of Participation[6] to Peer Review Organizations(PROs).[7] Some sates also require peer review in coordination with workmen's compensation or insurance legislation.[5]

In the eyes of the practicing physician, perhaps the single most important function of the peer review committee is the determination of staff privileges.[2] After the physician is granted privileges by the peer review group operating within the hospital, his/her performance is monitored and evaluated according to established hospital policies and procedures.[8] If his or her conduct is deemed unprofessional, or if he/she provides substandard care, the peer review group can terminate, restrict, or deny his/her privileges or take any other steps necessary to alleviate the problem. The peer review committee also may report its finding to a medical disciplinary licensing board. Therefore, physicians should be alerted to the fact that the peer review process not only is essential to maintaining quality care but also provides an ideal setting for controlling the market in a particular geographic region.

Applicable Antitrust Provisions

Physicians enjoyed virtually absolute immunity from the scrutiny of antitrust provisions until the mid 1970s. At that time, however, the Federal Trade Commission and the courts began to recognize that health care facilities were subject to attack by the antitrust laws.[9] Staff privilege decisions were an area essentially untouched for a time, but the increased number of medical school graduates and the institution of diagnostic-related groups (DRGs) and other cost-containment measures resulted in greater competition, thereby increasing the litigation associated with the process.

There are two federal routes of antitrust attack available to a physician who believes he/she has been denied hospital privileges for illegal reasons. These include a violation of Section 1 of the Sherman Act, and/or a violation of Section 2 of the Sherman Act. Although a favorable verdict for the plaintiff/physician may result in treble damages being awarded under either of these sections, the majority of cases have been decided in favor of the hospital.[9] Of consideration also is the expense required by a physician pursuing such a claim. Proof of an anticompetitive motive by the peer review organization may require extensive discovery methods, numerous depositions, and filing and responding to various motions designed to prolong and thwart the entire judicial process, all of which can prove to be very expensive for the established physician as well as the novice just beginning to practice medicine. To compound the problem, the hospital usually will provide extensive detailed documentation substantiating its decision to revoke or deny the physician's privileges based on his/her credentials, personal character (bedside manner), or treatment skill in general. In sum, the physician must apply the typical cost-benefit analysis when considering pursuing such a claim.

In the past, impediments have prevented the effectiveness of antitrust challenges to hospital privilege denials. The most important one being that courts believed the hospital was in the best position of assessing its employees and, therefore, its (hospital's) decisions should not be questioned.[9] In other words, the courts did not want to act as a "super board of directors" relegated to a role of ruling on every decision

presented to it. Recent changes in the organization of hospitals competitive environment have led to a weakening of such a rationale. Today, the threat of an antitrust suit against a hospital (or its peer review group) is something the hospital cannot dismiss as a mere nuisance.

Section 1 of the Sherman Act provides that "every contract, combination... or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations is illegal."[10] In alleging a violation of this section, three elements must be shown: (1) a conspiracy, (2) a restraint of trade, and (3) a nexus to interstate commerce.[11]

Demonstrating the presence of two or more economically separate entities is the first part of the conspiracy analysis.[11] As a result of the *Monsanto*[12] decision, an antitrust combination requires a conscious commitment to a common scheme. Since staff privileges are required to enable a physician to practice medicine at an institution, medical staff credentialing with attendant approval by the board of trustees can often easily be shown to promote a "common scheme."

The second part requires a showing of restrained trade. This goes hand-in-hand with the analysis discussed in the previous paragraph. Since the decision to deny or revoke staff privileges usually is based on a recommendation to the hospital board of trustees by a group of physicians enjoying such privileges, it would be almost economically prudent for such a group to prevent new ones from obtaining privileges. Thus a scenario ideal for a restraint of trade is established.

Typically two standards are employed when considering a Section 1 violation. The privilege denial may be considered a "horizontal boycott," which occurs when one business entity takes action at the request of a second business entity.[9] If the physician can prove this, then the court will apply a *per se* standard whereby the physician: (1) is relieved of showing harm to the public or a lessening of competition, and (2) the defendant (hospital) is prohibited from introducing evidence supporting the worthy purposes behind such a restraint.[9] The denial also can be considered a *per se* unlawful "exclusive tying arrangement." Such an arrangement exists where a business (hospital) with a market power over a product or service uses that power to require consumer to purchase a different product or service.[11]

Section 2 of the Sherman Act provides that "every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nation, shall be deemed guilty of a felony...."[13] The threshold requirement in a Section 2 case is the determination of the hospital's (peer review group's) market or monopoly power.[11] It can be defined as the power to raise prices and exclude competition in a relevant product/service and geographic market.[11]

Thus, a hospital has market power if it can exclude competition (through a denial of privilege determination) from a particular territory permitting it to alter the competitiveness of the services it offers and preventing other suppliers from entering the same market.[14] An analysis of the relevant geographic market is, therefore, essential when proving a Section 2 violation. The *Robinson*[14] case noted that even if other hospitals are present within the relevant geographic market, a physician can still allege that the defendant hospital maintains a monopoly over some services (particularly if the physician is a specialist).

Interstate Commerce Of practical consideration when contemplating filing an antitrust claim is the requisite proof of a substantial and adverse effect of interstate commerce. Although this will be mentioned during the discussion of cases in the next section, a few ideas will be noted here. First, it is questionable whether a hospital should challenge a complaint based on lack of interstate commerce, because even if the motion is successful the plaintiff/physician will be allowed to amend the complaint and allege further sufficient facts indicating the requisite effect on commerce.[15] Second, an interstate commerce challenge may require a great deal of time and resources that could be better utilized in defending other factual (as well as legal) aspects of the case. However, some cases have proved to be quite successful for a defendant hospital alleging lack of interstate commerce. Therefore, it should not be summarily dismissed as a implausible challenge.

State Action Immunity This appears to be the most likely affirmative defense that will be raised in an antitrust liability suit in the staff privilege arena. This is definitely the murkiest area surrounding the antitrust lawsuit. The state action doctrine, first enunciated in *Parker v. Brown*,[16] holds that activities compelled by the state in its sovereign capacity are immune from antitrust scrutiny. Where the challenged activity is sought to be justified by reference to a regulatory action as opposed to direct legislative compulsion, the restraint must meet a two-part test: (1) it must be "clearly articulated and affirmatively expressed as a state policy," and (2) the policy must be "actively supervised by the state itself."[17] Again, we will discuss this further in relation to particular cases. Suffice to say that although the two-part test seems superficially definite in its terms, it gives juries and judges a tremendous amount of discretion. While some courts have focused on the first part of the test, other courts have focused entirely on the second part. Regardless, it remains the major shield of armor for the hospital/peer review group facing antitrust litigation. One writer in 1986 noted, however,

> It is unlikely that staff privilege decisions will ever meet the test of *Parker v. Brown* immunity. Most states do delegate regulation of hospital conduct to health departments which promulgate rules designed to assure that hospital medical staffs are composed of quality providers. However, these regulatory schemes do not direct hospital to exclude physicians for reasons unrelated to their competence -- the only kinds of decisions which will be found anticompetitive under the antitrust laws. Since such anticompetitive exclusions are not a

matter of state policy they should not enjoy *Parker v. Brown* immunity.[11]

Although the logic employed in such a statement may seem convincing on the surface, it has clearly been disproved by recent decisions handed down by various circuit courts.

In light of the above, one writer notes several suggestions that should minimize the risk of antitrust liability surrounding peer review decisions:

1. The governing board should play an active role in staff privilege decisions, and that role should be documented. Moreover in light of *Weiss v. York Hospital*, the hospital rather than the staff should be the real decision maker.
2. The medical staff should only make decisions regarding competence and conduct qualifications. The board should make decisions regarding the other relevant variables, especially the decision about the need for the applicant's services.
3. Administrative officials at the hospital should monitor credentialing procedures to ensure that no staff member is pursuing an independent personal stake or an anticompetitive "joyride."
4. The administration should ensure that the medical staff bylaws are strictly followed, and should ensure that the credentialing procedure is fair. While the antitrust laws do not require that an applicant be granted due process,[18] a biased procedure can have a number of adverse practical ramifications, such as serving as circumstantial evidence of a conspiracy and an anticompetitive intent.
5. Where a termination of privileges occurs, the hospital should find a replacement.
6. The hospital should minimize the role of the applicant's direct competitors in the credentialing process, so that the competitors do not participate in the actual decision making.
7. The adverse input of an applicant's competitor should be subject to cross-examination or rebuttal.
8. The reasons for the governing board's ultimate decision (assuming that the reasons are not anticompetitive) should be well documented.
9. The hospital's attorney should be consulted immediately whenever the staff's recommendation is adverse to the applicant
10. The hospital should attempt to insure itself against antitrust risk. (See Health Care Quality Improvement Act, below, regarding this issue).

Cases Involving Peer Review and Associated Antitrust Liability

Cases Prior to Patrick Although the *Patrick v. Burget* case is the predominant case in the area of peer review associated antitrust liability, it is necessary to understand its predecessor cases to determine its precedential effect, if any. These cases, and others cited, have focused on varying aspects of antitrust (interstate commerce requirement for jurisdictional purposes, state action immunity, etc.), but predominantly have exonerated the defendant hospital or peer review group involved. A review of these cases will show, therefore, that the *Patrick* decision should be considered unique and an anomaly.

One of the first important cases regarding the denial of clinical privileges is *Marrese v. Interqual.*[19] In *Marrese*, an orthopedic surgeon filed suit alleging various defendants had conspired to restrain trade, violative of Section 1 of the Sherman Act, and had monopolized the market for orthopedic and neurological procedures in the Evansville, Indiana area, violative of Section 2 of the Sherman Act.[19] The court in a somewhat lengthy decision held that the state action doctrine immunized the defendants from any antitrust liability.[19]

Of more significance than the actual decision is the analysis the court employed. First, the court addressed the requisite finding of interstate commerce needed for antitrust jurisdiction. The Supreme Court, in *McLain,*[20] established the standard as "the defendants' activities must be shown as a matter of practical economics to have a not insubstantial effect on the interstate commerce involved."[21] In finding interstate commerce present in *Marrese* the court notes several factors including:

1. Dr. Marrese treated out-of-state patients;
2. Dr. Marrese purchased medicine, equipment, etc. from out-of-state suppliers;
3. Dr. Marrese derived revenues from Medicare, Medicaid and out-of-state insurance companies;
4. Revocation of his privileges would prevent him from practicing orthopedic medicine in Evansville, Indiana or anywhere in the United States.[22]

The Court then considered the defendant's conduct in recommending Dr. Marrese's clinical privileges being revoked.[22] The court discussed several sections of the Indiana Code that addressed the peer review process in light of the state action doctrine.[23] The court when considering the first part of the *Parker* test ("clearly articulated and affirmatively expressed state policy") noted that the State of Indiana mandated "hospital medical staffs . . . to form peer review committees . . . to review the quality and necessity of the care provided patients, to evaluate the qualifications of staff members, and review the merits of any recommendation against a staff member," thus satisfying the first element of *Parker.*[24] Regarding the "active supervision" prong of the *Parker* test, the court found two entities (the Hospital Licensing Council of the State Board of Health and the Indiana Medical Licensing Board) operating within Indiana that it felt insured Indiana citizens of quality medical care and "actively supervised" the medical peer review process.[25](NOTE: Remember this regulatory scheme when *Patrick* is dis-

cussed below. The court there failed to find "active supervision" with similar entities present.)

The *Marrese* court further noted that "subjecting members of the peer review process to a federal antitrust lawsuit would chill the rights and obligations of physicians to participate in peer review.[25] It also cited the *Pontius v. Childrens Hospital* decision which declared,

> if individual physicians, who manage to overcome their traditional reluctance to testify about the professional conduct of a colleague, know that by so doing they risk incurring legal fees running into six figures and a trial of a duration measured in months, on the mere allegation that they have conspired to restrain trade, the discovery of incompetent physicians will be rendered extraordinarily difficult.[26]

This is one factor that the Supreme Court neglected to consider important or give great deference to in *Patrick*. In conjuction with these notions, the *Marrese* court found,

> As a matter of judicial economy, the Federal courts must not be further burdened by complex antitrust litigation when the alleged illegal conduct is mandated and supervised by the state and, furthermore, the plaintiff is afforded the due process safeguards of hearings and state court review.[27]

This, in my opinion, is the logical rationale surrounding the peer review process.

Another significant case decided prior to *Patrick* is *Posner v. Lankenau Hospital*,[28] which was decided subsequent to *Marrese*. The physician in *Posner* alleged violations of Section 1 of the Sherman Act and Pennsylvania's common law prohibiting unreasonable restraints of trade (our discussion will concentrate on the former). The court found the defendants were not immune from antitrust liability via the state action doctrine.

In considering the first prong of the *Parker* test, the court cited various sections of the Department of Health regulations that required health facilities to have an organized medical staff and also established its duties.[29] It noted other regulations that delineated duties of the medical staff and credentials committees.[30] The court, however, noted that none of the regulations governing the health facilities expressly permitted anticompetitive conduct.[31] It stated,

> Allowing medical staffs to make hospital staffing decisions based on professional or ethical grounds is not tantamount to an approval of anticompetitive conduct. That some medical staffs may be able to engage in anticompetitive conduct while in compliance with the Pennsylvania regulatory scheme does not necessarily demonstrate that the legislature intended to permit such conduct.[31]

In distinguishing *Marrese*, the court found that the *Marrese* court never determined the issue of whether Indiana law clearly expressed an intent to permit anticompetitive conduct. Although this may appear to be true, the *Marrese* court seems to have the more realistic approach to the first prong of the *Parker* test. It appears that it, unlike the *Posner* court, would retreat from a direct verbatim statement of state policy permitting anticompetitive conduct. That, in my opinion, is the better approach since it is doubtful any legislature when enacting a law will state in its legislative history (or elsewhere) that its intent is to foster anticompetitive conduct. Therefore, I believe the *Posner* rationale is fatally flawed.

The last of the cases decided before *Patrick* that will be mentioned is *Quinn v. Kent General Hospital*.[32] In *Quinn*, an orthopedic surgeon filed suit after the defendant hospital refused to admit him to its active medical staff. The gravamen of his complaint focused on the assertion that the aforementioned refusal to staff constituted a "group boycott" in violation of Section 1 of the Sherman Act and an unlawful monopolization in violation of Section 2 of the Sherman Act. The court here found that the defendant's actions were not immune from antitrust.

In assessing the jurisdictional requisite of interstate commerce, the court noted that Dr. Quinn has alleged sufficient facts to demonstrate its presence. However, when it addressed application of the state action doctrine it found that the issue was "not whether Delaware had adapted a clearly articulated policy of promoting the medical peer review process, but whether the legislature intended to displace competition in the market for hospital facilities.[32] The court did retreat from the *Posner* rationale stating,

> [i]t is true that the clear articulation test does not require that the legislature expressly state in a statute or its legislative history that it intends for a delegated action to have anticompetitive effect.[32]

But it noted there was nothing in Delaware statutes that hinted the peer review process would be promoted by conferring a monopoly on those serving on peer review committees.[32] Although the result reached here is still difficult for me to digest, the reasoning is more logical. Of particular significance is the statement by the court,

> Where the state itself acts and does not merely authorize conduct by private parties or municipalities, there is no reason not to suppose that the state intended the consequences of this action. In the present case, however, it is not the State of Delaware itself that has acted, but a private hospital and its credentials committee. In such cases, the Court must inquire whether the state did, in fact, intend to authorize anticompetitive conduct. Because there is no indication that the Delaware peer review statute was intended to displace competition, the court concludes that the conduct of the Hospital and its credentials committee is not immune from liability under the Sherman Act.[32]

The decision, however, departs from the traditional reasoning expressed in *Marrese* - which tends to promote the peer review process.

In sum, these three cases focus on various aspects of antitrust liability (jurisdiction, *Parker* immunity). Their final decisions, however, appear to revolve around the importance they place on state governing bodies and the promotion of effective peer review. Although I do not agree with all the decisions, many of the arguments are quite persuasive.

Patrick v. Burget In *Patrick*,[32] a physician claimed that members of peer review committee (many of whom were also members of a competing medical clinic) had attempted to deprive him of privileges, thereby violating Sections 1 and 2 of the Sherman Act. A district court jury in Oregon found in favor of Dr. Patrick, but the United States Court of Appeals for the Ninth Circuit reversed, finding the conduct of the defendants exempt under the state action doctrine.[33] The Supreme Court of the United States in a unanimous decision reversed, and awarded Dr. Patrick over $2.2 million in antitrust treble damages as established in the lower district court proceeding. Although the decision appears to impart considerable liability upon physicians participating on peer review committees, it should be noted that: (1) the case arose in a geographic area where there was essentially no competition for health care services, (2) the peer review committee evaluating Dr. Patrick's standard of care did not exercise "good faith," and (3) the court examined only the statutory protection available to practitioners sitting on committees in Oregon.

Patrick arose in the small town of Astoria, Oregon, having a population of only 10,000 people. Astoria Clinic, with which many of the peer review physicians were affiliated, had a monopoly on all physician services until Dr. patrick began his independent practice. Also, Columbia Hospital was the only hospital within a 50-mile radius.

This geographic environment contributed to egregious conduct by Clinic physicians against Dr. Patrick. Dr. Patrick received essentially no surgical referrals from the competing Astoria Clinic physicians. If he treated a "Clinic patient," the clinic doctors would react angrily. Clinic surgeons refused to enter into cross-coverage agreements with Dr. Patrick that would provide care for each other's patients if one of the doctors was unavailable.

Although these facts alone probably would have implicated the Clinic physicians in an anticompetitive scheme, there was also incontrovertible evidence that the peer review process was conducted in "bad faith." In this regard, it is important to realize that: (1) a Clinic partner chaired the committee of the Oregon Board of Medical Examiners that evaluated Dr. Patrick's cases, (2) typically Clinic physicians were involved in reporting Dr. Patrick's alleged substandard care, and (3) a Clinic physician chaired the committee from which Dr. Patrick sought review after his privileges had been revoked. The Court of Appeals, in analyzing such conduct by the physicians characterized it as "shabby, unprincipled, and unprofessional."[33]

The court, in *Patrick*, found that the "active supervision" requirement was not satisfied. In so doing the court noted that monitoring by two state agencies (the Oregon Board of Medical Examiners and the Health Division) would not satisfy the requirement. The court stated that the former only had the ability to recommend further disciplinary action and the latter to deny, suspend, or revoke the hospital's license. State officials, according to the court, must have and exercise power to review particular anticompetitive acts of private parties and disapprove those that fail to accord with state policy.[1]

The lower court[34] reached an entirely different conclusion. That court placed emphasis on the fact that any hospital decision terminating or restricting privileges was judicially reviewable. It found that Oregon courts had reviewed adverse privilege decisions to determine if they were made in good faith pursuant to fair procedures and were supported by the facts. The court determined that a combination of internal review by the hospital itself, review by the Board of Medical Examiners, and review by the court constituted "active supervision."[34] The Court of Appeals found that Indiana's scheme of medical peer review, as addressed in *Marrese*, was nearly identical to that existing in Oregon. It also distinguished the Quinn decision (discussed earlier) noting,

> The peer review process allows doctors to agree to eliminate a competitor from the market because they believe his or her product is substandard. An analogous scheme would allow GM, Chrysler, and Ford to review the safety of Toyotas to determine if the public should be allowed to drive them . . . The fact that the state's regulations may be wise and in the best interest of consumers does not alter the fact that the regulations limit fee competition.[34]

The 9th Circuit decision also discussed the issue of "bad faith." The court found that once the state had enacted a system replacing competition with regulation, federal antitrust laws are displaced and the subjective underlying motivations of the actors are not considered.[34] The court also stated that although the Oregon statute only immunized "good faith" conduct, it did not alter the fact that the actions challenged were those of the state. The court in this regard, doubted that a state would ever authorize a per se "bad faith" action.[34]

The Supreme Court decision appears to be the most flawed in its discussion of the judicial review available to disgruntled physicians who receive adverse privilege determinations. It found that no statute expressly authorized judicial review and found no cases where an Oregon court has determined that such judicial review was available to disgruntled physicians who receive adverse privilege determinations. It found that no statute expressly authorized judicial review and found no cases where an Oregon court had determined that such judicial review was available. The court further noted that even if judicial review were accorded, it would be of very limited nature. The Court of Appeals decision appears to be more realistic.[35]

In sum, the Court of Appeals decision demonstrates the more logical approach to privilege determinations, as well as the approach that will most likely encourage continued effective peer review. The Supreme Court decision suggests that future rulings will depend on the statutory scheme present in the respective state where the action is instituted. It also appears to keep alive the idea that judicial review *may* constitute adequate state supervision.

Cases Subsequent to Patrick An analysis of recent case law demonstrates that the *Patrick* decision has not received the acceptance envisioned. Ironically, both the below-mentioned cases following the *Patrick* decision were decided within a day of each other. However, the complaints in each were dismissed or disallowed for different reasons.

In *Bolt v. Halifax Hospital Medical Center,*[36] the Eleventh Circuit Court of Appeals refused to award damages to a physician who filed suit against three hospitals, a local county medical society, and numerous physicians in the Daytona Beach area in Florida. Dr. Bolt had alleged that the defendants had conspired to restrain trade in violation of Section 1 of the Sherman Act.

The court, in considering the presence of three conspiracies, noted that the hospital and member of its medical staff were legally capable of conspiring with one another, although other courts had ruled contrariwise.[37]

In regard to the two-pronged *Parker* test, the court found that a clearly articulated policy condoning the peer review process existed under Florida statutory law.[38] The court made reference to three statutory provisions,[39] one of which stated that "[n]o action shall be taken [by the hospital's governing board] without prior referral to the medical staff for their recommendation."[40] The court deemed these sections sufficient in satisfying the first prong.

The court experienced difficultly, however, when considering the second ("active supervision") prong. It noted the presence of the Florida Board of Medical Examiners (which did not have the power to overturn peer review decisions) but stated that the state judiciary could serve as the supervisory authority. It found that the *Patrick* decision had left that question unanswered. The court stated

> We perceive no principled basis for distinguishing traditional judicial review from agency review, however. The purpose of the active state supervision requirement is to ensure that the conduct in question is in fact the product of state regulation.
> ....
> Of course, judicial review cannot constitute active state supervision unless it is available on an established basis and is of a sufficiently probing nature. To be sufficiently probing, the scope of judicial review must first of all encompass the fairness of the procedures used in reaching the decision. Furthermore, it must involve consideration of whether the criteria used by the decision makers were consistent with state policy and whether the decision had a sufficient basis in fact.[41]

Therefore, the court in *Bolt* took *Patrick* one step further in its analysis. Since *Patrick* left open the question of judicial supervision satisfying the second prong of *Parker*, the *Bolt* court seized the opportunity to use it as justification for upholding the conduct of the peer review organization. Of significance also is the fact that "bad faith" was not demonstrated to the degree shown in *Patrick*, if at all.

Finally, the *Mitchell v. Frank R. Howard Memorial Hospital*[42] case revived the interstate commerce requirement issue. In *Mitchell*, a radiologist alleged violation of section 1 of the Sherman Act after the hospital terminated its agreement with him and subsequently contracted with another radiologist to provide the services. The court here did not even reach the question of state action immunity noting that Howard Memorial Hospital did not significantly affect interstate commerce; therefore, federal antitrust laws were inapplicable. The court, citing *Hospital Building Co. v. Rex Hospital Trustees,* [43] noted,

> determinations of [Sherman Act] jurisdiction [in hospital cases] are based not merely upon revenue figures, but on a broad aggregate of factors including proximity of the facility to regional centers of commerce or to other states, treatment of significant numbers of out-of-state patients, purchase of equipment and supplies from interstate sources and interstate transfer of payment for patient care.[44]

The court acknowledged the facts established by Dr. Mitchell,[44] but found that the activities did not substantially affect interstate commerce.

In sum, the cases after *Patrick* indicate that it may not have received the judicial acceptance feared by hospitals and peer review organizations operating within them. The *Bolt* and *Mitchell* cases point out avenues still available in upholding the sanctity of peer review decisions if they are made in "good faith." *Bolt* focuses on state judicial review, whereas *Mitchell* provides an alternative defense/justification for the rural hospital whose effect on interstate commerce is shown to be negligible.

The Health Care Quality Improvement Act

Passed in 1986, the Health Care Quality Improvement act[45] (hereafter HCQIA) is designed to provide additional immunity to persons or entities participating in or providing information to peer review organizations. The legislative history of the HCQIA indicates it "is to improve the quality of medical care by encouraging physicians to identify and discipline other physicians who are incompetent or who engage in unprofessional behavior."[46] The HCQIA was passed in a large part as a result of the *Patrick*[1] case discussed above. Physicians conducting peer review activities felt they may be exposed to damage suits by physicians who, after losing their hospital privileges, would contend that the peer review action was performed under the guise of violating the physician's legal rights.[47] It was hoped that the HCQIA would alleviate those concerns, thus promoting a more effective peer review system. Although Congress noted that medical malpractice was a growing phenomenon, it did not directly address that problem in the HCQIA.[46] Rather than addressing physicians' fear of becoming embroiled in malpractice litigation as a result of their peer review participation, the HCQIA focuses on disposing of the fear of being a defendant in a suit brought by a reviewed physician. [2]

The HCQIA is comprised of three major aspects. First, the HCQIA provides a federal immunity to hospitals and physicians who participate in the peer

review process if certain due-process guidelines are followed. Second, the HCQIA creates a national depository in which medical malpractice insurers, hospitals, and state medical licensing boards must report settlement claims and corrective actions taken against any physician. Third, hospitals planning to hire new physicians must make an inquiry to the aforementioned depository to determine if he or she is in good standing and also must make an inquiry to the depository every two years regarding each physician who has been granted clinical privileges.[47]

Many states have enacted statutory privileges to protect peer-review practitioners from civil liability suits,[2] but the statutes vary as to the degree of immunity provided (qualified to absolute). Also, statutes may require that the peer review be conducted in "good faith," in a reasonable manner, or without malice.[2] It was envisioned by its drafters that the HCQIA would provide a more uniform standard to be followed. The HCQIA does contain some troublesome areas and its benefits may be more symbolic than substantive.[48]

Provisions of the HCQIA Subchapter I of the HCQIA is designed to eliminate many of the deterrents associated with peer review with the underlying motive of improving physician competence and conduct.[8] It provides immunity under both federal and state laws from damage suits against peer review groups and individuals.[49] HCQIA does provide an exception, however, for certain civil right actions but does not preclude Clayton Act antitrust suits being brought by the United States or a State Attorney General.[49] The HCQIA further protects the person who provides information to the peer reviewing entity unless he/she knowingly provides false information.[50]

The grant of immunity established in the HCQIA is founded upon two required showings: (1) the sufficient due-process protections were accorded to the physician under review and (2) that the peer-review group conducting the review and examination process based its recommendation of any disciplinary actions on the belief that it would further the quality of health care at the institution.[51] Of significance, however, is that the HCQIA does not prevent a physician from seeking alternative remedies from a peer-review group's actions such a declaratory or injunctive relief.[2] To qualify for protection, the professional review action must be taken

> 1. in the reasonable belief that the action was in the furtherance of quality health care,
> 2. after a reasonable effort to obtain the facts of the matter,
> 3. after adequate notice and hearing procedures are afforded to the physician involved or after such other procedures as are fair to the physician under the circumstances, and
> 4. in the reasonable belief that the action warranted by the facts. known after such reasonable effort to obtain facts and after meeting the requirement of paragraph (3). [52]

It should be noted that the terms "reasonable belief" are used instead of "good faith" standard. In addressing this issue, the Energy and Commerce Committee noted that "good faith might be misinterpreted as requiring only a test of the subjective state of mind of the physicians conducting the professional review action."[2] The Committee also stated that "this [reasonable belief] standard will be met in the overwhelming majority of professional review actions." Therefore, the "reasonable belief" standard should prevent an objectively vindictive peer-review group from obtaining the protection of the HCQIA.[2]

Health care entities must also assure that their peer-review procedures comport with the fair hearing standards and notice requirements set forth within the HCQIA.[53] The HCQIA delineates what the drafters considered to be "adequate" notice and hearing procedures, though they appear merely to mirror due-process guidelines that every hospital should provide in their medical staff bylaws. The HCQIA details that the physician shall be provided with (1) notice of the proposed action, (2) notice of the hearing, and (3) the conduct of the hearing and notice.

Of particular significance in light of the *Patrick* decision, discussed above,[1] is the fact that the HCQIA enables the physician under review to request a hearing before (a) a mutually accepted arbitrator, (b) a hearing officer appointed by the entity and not in direct economic competition, or (c) a panel appointed by the entity not in direct economic competition.[54] This provision is aimed at removing the temptation from peer-reviewing groups of engaging in unlawful anticompetitive conduct and designating it as a legitimate peer review function.[2] The [Energy and Commerce] committee did note that such a process may create hardships of economies,[46] but felt such a system was necessary to insure fairness and an unbiased decision.

Another significant provision in Subchapter I is the section that provides the payment of reasonable attorneys' fees and costs in defense of a suit deemed "frivolous, unreasonable, without foundation, or in bad faith."[55] Although the [Energy and Commerce] Committee made no mention of this section in its report, it appears it is intended to deter those incompetent physicians who have been refused clinical privileges from tying up valuable court resources by pursuing unfounded claims of antitrust or interference with contractual obligation claims.[2]

Subchapter II requires a variety of entities to report malpractice payments and settlement as well as certain disciplinary actions against physicians to a national data bank, which as of this date is still not operative. A major impetus behind the drafting of this national depository of information was that Congress believed a centralized agency was needed to better chart the movement of physicians across the country. Physicians dismissed from one hospital because of incompetence or inadequate skill could move to another location with relative ease and resume the practice of medicine as if nothing had happened. This was a major concern for hospitals who often are drawn into lawsuits through application of respondeat superior or the negligent hiring of an employee. Thus, some method was needed to insure that patient would

continue to receive the type of quality health care they deserved.

Local peer review has shown success in alleviating the problem at the individual hospital where the physician practices, but once the doctor has his/her privileges removed at such an institution his/her threat to the patient population is removed and often no follow-up of the doctor is maintained. This type of system results in a chaotic scheme of incompetent physicians continually relocating after dismissal only to reappear on the doorstep of an unsuspecting hospital a short time later. Such a system has two basic flaws: (1) there is no national tracking device for the movement of physicians (particularly incompetent ones), and (2) peer-review committees who have ruled against physicians whom they consider incompetent are exposed to a variety of lawsuits including antitrust, defamation, and interference with contractual obligations.[2]

Typically, state licensing boards or national professional organizations (such as the AMA) were vehicles for controlling the movement of incompetent physicians,[2] but these institutions have had only a small impact on a growing problem. A major reason underlying such a dismal showing by these groups is the inconsistency and unpredictability of their decisions.[2]

To attack the problem of the relocation incompetent physicians, the HCQIA requires health care entities to report their findings to their state's Board of Medical Examiners.[56] Such a report is required if the health care entity

> (A) takes a professional review action that adversely affects the clinical privileges of a physician for a period longer than 30 days;
> (B) accepts the surrender of clinical privileges of a physician-
> i) while the physician is under an investigation by the entity relation to possible incompetence or improper professional conduct, or
> ii) in return for not conducting such an investigation or proceeding; or
> (C) in the case of such an entity which is a professional society, takes a professional review action which adversely affects the membership of a physician in the society.

It is significant that HCQIA requires the reporting of voluntary resignations, because often physicians will attempt to "plea bargain" their resignation in return for the dismissal of any charges brought against them.[2,46] The term, "adversely affects" should provoke a tremendous amount of litigation.[57] Although it is defined as including "reducing, restricting, suspending, revoking, denying, or failing to renew clinical privileges or membership in a health care entity,"[57] physicians probably will be compelled (if not encouraged by their attorneys) to litigate every purported change in position as it could be deemed adversely affecting their privileges.

Perhaps the most important feature of this Subchapter of the HCQIA is that information obtained by each state's Board of Medical Examiners is forwarded to the Secretary of Health and Human Services.[57] In further support of the effective reporting requirement, state boards also are required to report any sanctions they impose such as a censure, reprimand, etc.[57] The information reported must include

> (A) the name of the physician involved,
> (B) a description of the acts or omissions or other reasons (if known) for the revocation, suspension, or surrender of license, and
> (C) such other information respecting the circumstances of the action or surrender as the Secretary deems appropriate.[57]

The legislative history notes regarding the information to be reported that [I]t does not necessarily require an extensive description of the acts or omissions or other reasons for the action or, if known, for the surrender. It does, however, require sufficient specificity to enable a knowledgeable observer to determine clearly the circumstances of the action or surrender.[46]

The HCQIA also requires the reporting of medical malpractice payments.[58] These payments include settlements, partial settlements, or satisfaction of judgments related to malpractice actions or claims. The HCQIA requires that the party actually making the payment, whether it is the hospital, insurance company, etc, must report the information to the Secretary. the information required to be reported includes

> (1) the name of any physician or licensed health care practitioner for whose benefit the payment is made,
> (2) the amount of the payment,
> (3) the name of any hospital with which the physician or practitioner is affiliated or associated,
> (4) a description of the acts or omissions and injuries or illnesses upon which the action or claim was based, and
> (5) such other information as the Secretary determines is required for appropriate interpretation of information reported under this section.[58]

The HCQIA insures the reporting of information by imposing sanctions on those entities failing to comply with its requirements. Such sanctions may include civil money penalties of not more than $10,000 or the loss of immunity for the institution as provided in the act itself.[58]

To justify such a conglomeration of facts and data, the HCQIA requires that hospitals utilize the information available in the national depository before attempting to hire any new physicians. Thus, the hospital is endowed with two duties regarding clinical privileges

1. to check the data bank before granting privileges,
2. to check the data bank every two years.[58]

In the event the hospital fails to comply with these requirements it will be presumed that it has implied knowledge of the information,[58] which could prove to be devastating in a malpractice action.

In conjunction with the litigiousness surrounding the definition of "adversely affecting," Congress realized another corresponding potential problem area. As was noted in the legislative history, "Many people in the medical field told the Subcommittee on Health and the Environment that the reporting system would

inevitably result in an enormous increase in litigation. The reason: faced with the certainty that they can no longer hide their past records, physicians facing disciplinary action will feel compelled to challenge vigorously any action taken against them. Based on recent experience (probably referring to the *Patrick* case), the Committee believes many of these physicians will file antitrust lawsuits.[46] Although the HCQIA attempts to redress this issue in numerous ways (such as general limitations of liability), it is questionable whether the desired elimination of antitrust claims is accomplished.

The HCQIA: Will it Help? Although the HCQIA, when considered in its entirety, has some advantages over the more traditional state-regulated peer-review process, it leaves several questions unanswered - two of which were discussed above. The reporting system envisioned by the HCQIA may result in fewer incompetent physicians practicing medicine, but it appears that it will involve a mass of data that more likely than not will be difficult to access or simply will be too confusing to understand. Another drawback to the HCQIA is that states are given the choice of whether to opt-in or opt-out of its confines.[59] If an individual state declares through its legislature that it intends to "opt-out," the inconsistency of peer review throughout the nation will be perpetuated.[2] Although the HCQIA does allow an opt-out of the liability provisions, states must still participate in reporting scheme establishes. In light of this, physicians could face a dilemma in states where liability is not limited: they will violate the HCQIA if they do not publish information regarding incompetent physicians, but if they do report the required information, they may face litigation from physicians sanctioned.[2]

Another potential problem involves the hearing committee, which is to be composed of individuals who are no in "direct economic competition" with the practitioner being reviewed.[60] Such an ambiguous term obviously will lead to a multitude of cases that will be fact-specific focusing on such things as the type of physician involved, his specialty or specialties, the area where he practices, the specialties of those reviewing him, etc. As one writer notes,

> It is difficult to judge how strictly the standard must be interpreted in evaluating potential members of a hearing panel. Unless the regulations provide clear and helpful guidelines, this ambiguity seems certain to spawn considerable litigation, as attorneys for disciplined physicians attempt to find and exploit a loophole allowing them to override the immunity otherwise established by the Act.[48]

In sum, the HCQIA is not the cure-all Congress intended it to be. Although it provides guidelines for hospitals to follow when conducting peer review, it appears to simply codify basic due-process rights that peer review committees traditionally have followed in the majority of cases. Its vague definitional framework and its absence of effect on "bad faith" peer review and antitrust seem to thwart the intended goals supporting its passage by Congress.

Protection via Insurance Coverage When considering the protection of peer review activities by insurance policies one treatise notes

> Insuring against the risk of antitrust liability for corporate officers and directory should be permissible. Such an agreement does not seem to be against public policy and should, therefore, be enforceable. Such insurance may not be available, however.[61]

Most hospital liability insurance policies neither expressly include nor expressly exclude provisions covering antitrust damages. Courts, however, when interpreting the general coverage provided in professional or business liability policies have allowed the coverage of antitrust damages.[62] The degree of policy coverage depends not only on the language utilized but also on the type of policy under consideration.[63] The four types of policies typically employed and applicable include personal, corporate, professional, and directors-and-officers.

Personal Policies Although personal insurance (homeowner's coverage) may provide coverage for claims related to "personal injury" (false arrest, slander, defamation, invasion of privacy, etc.), it usually provides no coverage for acts performed as an employee or representative of a hospital.[63] Claims frequently excluded in personal policies are:

> 1. Business pursuit (partnerships, solely owned businesses, corporate liability, joint ventures, or the rental or holding for rental of any part of any premises by any insured).
> 2. Punitive or exemplary damages.
> 3. Damage to persons or property that is expected or intended by the insured.
> 4. The rendering or failing to render professional services.[63]

Hospital Professional Liability Policies This type of insurance appears to be the most likely place where antitrust liability coverage would be found. These policies generally protect the hospital from claims such as:

> 1. Medical, surgical dental, nursing and other health care and ancillary services, including food and beverage.
> 2. Activities of board and committee members.
> 3. Members of medical or professional staff committees, including committee members aiding in evaluations of qualifications for hospital privileges.

The individuals ordinarily described in the policy's "Definition of Insured" include officers and directory, volunteer, and members of committees.[63]

Directors and Officers Liability Policies These policies typically allow a hospital corporation (for-profit or not-for profit) to insure its liability, if found, to indemnify its officers and directors from any litigation or settlement expenses. Coverage customarily is provided to officers and directors for matters associated with their service as an officer or directory for omissions, misstatements, etc.[63] One problem associated with these policies is that they often exclude indemnification for fines or penalties imposed by law, which may prevent their use in a case involving trebled antitrust damages.[63]

Hospital General Liability Policies The two most prevalent types of hospital general liability policies are (1) the Farmer's/Truck Insurance Exchange and (2) the Professional Hospital Policy of St. Paul Fire and Marine Insurance Company. The former typically covers Hospital and professional services designated as:

> activities for any person as a member of a board or a committee of the insured, as a member of any committee of the medical or professional staff of the insured, as a person communication information to the insured or its medical or professional staff for the purpose of aiding in the evaluation of the qualifications.[63]

The insured (people covered by the policy) typically include a wide range of individuals such as:

> any person as a member of a board or any committee of the insured, as a member of any committee of the medical or professional staff of the insured, as a person communicating information to the insured or its medical or professional staff for the purpose of aiding in the evaluation of the qualifications, fitness, or character of an applicant for membership or privileges on such medical or professional staff or for purposes of initiating corrective action.[63]

The St. Paul policy typically employs language providing coverage for "the actions of any formal accreditation board or any similar board in the hospital" or "the actions of those charged with carrying out such board or committee directives."[63] The insureds protected in the policy often include committee or board members to the extent of "claims resulting directly from their duties as members of such committees or boards."[63]

Limits on Insurability and Cases Some state legislatures that have passed acts prohibiting insurance coverage for activities such as malicious or wilful conduct may thereby exclude overage for claims based on an antitrust theory.[63] A strong public policy argument is provided as explanation by these courts when ruling in such a manner. It is believed the insured will be deterred from such future criminal or civil actions only if the costs/penalties are borne by him/her alone.

Two cases that have dealt with the issue of insuring against antitrust liability are *Jefferson-Pilot Fire and Casualty Co. v. Boothe, Prichard & Dudley*,[64] and the *St. Paul Insurance Companies v. Talladega Nursing Home, Inc.*[65] The former case involved a tying arrangement violative of section 1 of the Sherman Act. In finding the violation insurable, the court noted that the policy excluded coverage only for "any dishonest, fraudulent, criminal or malicious act or omission of the insured."[66] In the latter case *St. Paul*, the court determined that the Alabama public policy prohibited insurance against intentional or willful wrongs, thereby prohibiting insuring against an antitrust violation. The court, therefore, held that the insurer (St. Paul) had no obligation to defend a nursing home against a monopolization suit by a competitor. A third case, now pending in the courts, is *Harris v. Continental Casualty and Truck Insurance Company*,[67] which involves one of the defendants in the *Patrick v. Burget* case (mentioned *supra*). At issue is the scope of coverage provided by the Truck Insurance Exchange's policy, which did not expressly provide coverage for antitrust arising out of peer review.

Conclusion

Most physicians and health care administrators are aware of the recent Supreme Court decision of *Patrick v. Burget*, but they should not be overly alarmed about its outcome. The *Patrick* case clearly was decided on a egregious set of facts that pertained only to the statutory scheme of peer review existing in Oregon. The *Patrick* decision should not chill physicians' willingness to participate in the peer review process. Its result is far from predictive of liability in the vast majority of cases. The recent *Bolt* and *Mitchell* decisions demonstrate that the courts will continue to protect those physicians who exercise "good faith" while participating on peer-review committees.

Most hospitals have excellent peer-review processes operating within their facilities. However, it is recommended that peer-review groups consult with the hospital's board of trustees to consider whether some form of the HCQIA due-process guidelines is available to medical staff members and whether the hospital's insurance coverage would provide antitrust protection to peer-review participants. Each hospital also should consider case law and statutory law regarding what protection is available to peer review participants within their particular state. These recommendations are not suggested to frighten peer-review participants about possible liability but to prevent that rare occurrence. Peer review serves a vital function in the hospital assuring quality care, and physicians who participate on these committees should make sure that this necessary function continues to be performed.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Med Chi . . .
Our Best Defense in Annapolis

Angelo J. Troisi FACHE, Executive Director

Last September Med Chi's Council entered into a five-year contract with the law firm of Rifkin, Evans, Silver, and Lamone. The contract requires the firm to provide legislative and legal advice on all matters facing the Faculty.

The year was 1954 and Governor William Donald Schaefer was engaged in his first campaign for elective office. The field of candidates included some very tough competitors. Mr. Schaefer finished behind another young attorney from West Baltimore, Edgar P. Silver. This race for the Maryland House of Delegates was to be the only election William Donald Schaefer ever was to lose. Later, with the help of Edgar P. Silver, Mr. Schaefer went on to win the Fifth District race for the Baltimore City Council, the race for the Presidency of City Council, the race for the Mayor of Baltimore and, his most recent race, in which he defeated Steven Sachs to become Maryland's fifty-eighth governor. The latest polling studies show that William Donald Schaefer is the most popular governor in the history of the State of Maryland.

Mr. Silver, on the other hand, took a decidedly different path to professional and political success. He captured a seat in the Maryland House of Delegates after defeating Schaefer in 1954 and went on to serve twelve years in the Legislature. While in the Maryland General Assembly, Mr. Silver chaired a very powerful transportation committee and earned a reputation as a sage and practical problem solver. Perhaps it was these skills that prompted Governor Tawes to appoint him to the bench in Baltimore City where he served until 1989.

In the summer of 1989 Judge Edgar P. Silver became the catalyst for a significant Maryland event. He joined forces in partnership with three other attorneys to form a law firm with offices in Baltimore, Annapolis, and Washington, DC. The founding principle of the law firm was simple: to provide the highest quality legal advice based upon a team approach in furthering the best interests of clients. Joining Judge Silver were three other people with varied backgrounds and experiences.

At about the same time Judge Silver was beginning his first term in the House of Delegates, Alan M. Rifkin and Gerard E. Evans were born. Mr. Rifkin attended Loyola College in Baltimore where he graduated first in his class. He then went on to the University of Maryland School of Law, graduating with honors. As a college intern, Rifkin worked in the Maryland Senate for Finance Committee Chairman, Melvin A. Steinberg. When Steinberg subsequently became President of the Senate, Rifkin became Counsel to the Senate.

The 1986 ticket of Schaefer/Steinberg - Governor/Lt. Governor

saw Rifkin take a visible and important role in the campaign. Once the campaign was won, Alan Rifkin took the top slot on the Schaefer legislative team as the Governor's Chief Legal Officer. He left the Governor's service after two highly successful legislative sessions to practice law. Some of the great successes realized by Mr. Rifkin and Governor Schaefer include many progressive pieces of tort reform legislation aimed at addressing spiraling medical malpractice premiums. Without Rifkin's undaunted perseverance the possibility of such successes would have been remote. In private practice, Alan Rifkin rendered the same level of advice and guidance to the Medical and Chirurgical Faculty in many legislative and regulatory matters, including the drafting of a set of model hospital medical staff bylaws.

The third member of this team of lawyers is Gerard E. Evans. Mr. Evans is no stranger to the Faculty: he has represented them in Annapolis since 1986. Mr. Evans graduated from Frostburg State University with honors, achieved a master's degree in public policy from the University of Maryland and a juris doctorate from the University of Baltimore School of Law. For the past 10 years Mr. Evans has held increasingly more responsible positions in association with the Maryland General Assembly. For three years he assisted then-Chairman of the Senate Judicial Proceedings Committee, Thomas V. Mike Miller, Jr. From 1978 to 1981 he served as Special Assistant to Montgomery County Executive Charles W. Gilchrist, Jr. In 1986, Mr. Evans clerked for the Chief Judge of the Seventh Judicial Circuit, Ernest A. Loveless, Jr. His extensive political expertise includes serving as Finance Director for the Maryland Mondale/Ferraro Presidential Campaign as well as Finance Director for the Maryland Albert Gore, Jr. for President Campaign. Gerry managed J. Joseph Curran, Jr.'s successful 1984 campaign for Maryland Attorney General and currently serves as Deputy Chairman of the Maryland State Democratic Party.

The fourth partner in the firm is Linda H. Lamone, a seasoned veteran with unparalleled legal experience. Ms. Lamone served in the Attorney General's office for nine years. Her career there culminated with a position in the Office of Counsel to the Maryland General Assembly. As such she researched, designed, and drafted opinions on all types of legal issues considered by the Legislature. Upon leaving the Attorney General's office, she joined the staff of Lt. Governor Melvin A. Steinberg as a Special Counsel. Her responsibilities included shepherding various pieces of critical administration legislation through the Maryland General Assembly. Ms. Lamone is highly regarded in the legal community and, in fact, is President-Elect of the Women's Bar Association of Maryland. Her work in the area of gender bias and discrimination has achieved her accolades from around the country.

On September 14, 1989 the Council of the Medical and Chirurgical Faculty of Maryland entered into a five-year contract with the law firm of Rifkin, Evans, Silver, and Lamone. The contract requires the firm to provide legislative and legal advice on all matters facing the Faculty. An Associate member of the firm, Greg D. Hall, has been placed in the Faculty Office to provide day-to-day assistance in wading through the labyrinth of regulatory issues. Mr. Hall joined the firm and began working in the Faculty office on November 1, 1989. Mr. Hall has an impressive health care background. Working in his father's pharmacy in Arkansas he became familiar with physicians and the problems they face addressing the needs of their patients. Mr. Hall went on to pharmacy school and subsequently attained a juris doctorate from the University of Arkansas School of Law. Mr. Hall is one of a few dozen people in the United States to hold a master's degree in laws specializing in health care law.

The combination of legal, legislative, and political experience this firm brings to the Faculty is unrivaled. The practice of medicine has become a complicated and difficult endeavor. No longer can one attorney or lobbyist provide all that physicians need to survive the regulatory onslaught. The team approach Rifkin, Evans, Silver, and Lamone provide the Faculty is a melding of the best that Maryland has to offer. With offices in Baltimore, Annapolis, Washington, DC, and the Faculty's Cathedral Street headquarters, the firm can attack state as well as federal concerns. It is our sincere promise that the consummation of this relationship will directly benefit each and every member of the Faculty.

Area meetings and course announcements are listed each month under *Doctors Take Note*

Authors of Articles

Along with manuscripts submitted to ***MMJ***, please send an IBM compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

MORE THAN **250,000** PATIENTS HAVE ENJOYED HEALTH BENEFITS RESULTING FROM MEDIFAST.

MORE THAN **10,000** PHYSICIANS PRESCRIBE MEDIFAST WITH CONFIDENCE.

MORE THAN **10** YEARS OF DEDICATED SERVICE TO THE MEDICAL PROFESSION.

No Other Physician-Supervised Weight Control Program Delivers This Winning Combination ...and that makes Medifast #1

Physician-Supervised Protein-Sparing Modified Fast For the Safe • Rapid • Medical Treatment of Obesity

Doctor, one of every four of your patients has overweight problems that need medical help...the help of Medifast®.

A comprehensive program for rapid weight loss *and lifelong weight control,* Medifast has proven itself. For more than 10 years! To more than 10,000 physicians! To more than 250,000 patients!

TRAINING MANUALS

Medifast will work for you, too.

Patients lose weight with a program of physician-supervised modified fasting and behavior modification. And they keep it off with our exclusive *LifeStyles* Program.

The Medifast Program includes:

★*Training* – Comprehensive training manuals written by physicians, for physicians. Address all clinical and administrative aspects.

★*Medifast Supplements* – Extremely high quality. Medically formulated. Nutritionally complete.

★*LifeStyles* – The Medifast Program of Patient Support™. Teaches patients the way to long-term weight control and healthful living.

★*Clinical Consultation* – Medical and technical support specialists available daily at our toll-free number.

★*Practice Promotion Portfolio* – Complete with marketing ideas, office displays, posters, waiting room brochures, and advertising.

★*National Consumer Ad Campaign* – Builds public awareness, creates referrals.

LifeStyles; PATIENT SUPPORT

You know, Doctor, that more traditional methods of weight reduction are simply ineffective. And, severe overweight threatens your patient's health. Primary Care Physicians of every specialty recognize Medifast to be an important addition to their prescribed therapy and an effective way to increase their patient base.

Medical and Chirurgical Faculty of Maryland

Approved 9/14/89

Faculty Position

A.I.D.S.

Summary

The committee on A.I.D.S. recommends that the Medical and Chirurgical Faculty of the State of Maryland take a position on the following topics:

I. Education, prevention, and treatment programs
II. Discrimination
III. Protection of healthcare workers
IV. The present omnibus bill (Senate Bill #719)
V. Confidentiality law
VI. Physicians who are HIV positive
VII. Mandatory continuing medical education on A.I.D.S. for the licensure of physicians
VIII. Refusal of treatment because of a positive HIV antibody test
IX. Living long and living well
X. Mandatory Reporting
XI. Committee on A.I.D.S.

POSITION AND RECOMMENDED ACTIONS

I. EDUCATION, PREVENTION AND TREATMENT PROGRAMS

A. Encourage and support increases in education and prevention programs.

B. With the new data on AZT, encourage and support increased counselling, screening, and adequate funding for these as well as drug therapy (AZT, prophylactic pentamidine and newer drugs), and adequate physician reimbursement that is necessary to care for much larger numbers of people.

1. Persuade the legislature to release any frozen medicaid funds, and create new funding for these programs.

2. Ask the legislature to fund drug therapy for the working poor who have no insurance and whose only alternative to obtain the necessary medication is to quit work, leave their role as taxpayers, and go on public assistance in order to be eligible for Medicaid. This creates a much larger financial burden on the State than just simply paying for their drug therapy.

Medical and Chirurgical Faculty of Maryland

3. Urge private insurers to fund the cost of drug therapy in patients with asymptomatic HIV infection.

4. Vigorously uphold the principle that no one should be denied comprehensive health care for any reason.

II. DISCRIMINATION

Assume a leadership role in supporting the principle that no one suffer discrimination in health care, procedures, or in any area of their work or life because they are HIV positive.

III. PROTECTION OF HEALTH CARE WORKERS

Support the present MOSHA guidelines which are quite adequate.

LEGISLATION AND RECOMMENDED ACTIONS

IV. THE PRESENT OMNIBUS BILL (SENATE BILL #719)

This bill was a compromise of many different positions and points of view and was signed into law by the Governor. While the Medical and Chirurgical Faculty sponsored or supported some parts of the bill and opposed others, we should now support the bill since it has become law and oppose any attempts to modify or repeal specific provisions. There are several points that need to be addressed:

A. Informed Consent

Our attorneys, as well as the Assistant Attorneys General in the Health Department, among others have told us because of the medical and social consequences of a positive HIV test, we should have been obtaining informed consent all along, whether or not this has been legislated. Indeed, most hospitals and testing sights already had an informed consent that required counseling of the patient. The law simply puts into statue what was already the practice for the majority of the people tested in the State of Maryland. In the opinion of these attorneys, physicians who do not counsel or obtain informed consent put themselves at legal risk with or without the present law.

B. The provision regarding police, firemen, ambulance drivers and other personnel who come in contact with HIV positive individuals.

There is some misunderstanding about this part of the statue since the right of these individuals to be informed that they came in contact with someone who is HIV positive is generic. They may be informed that they came in contact with an individual, but not given the name of that individual. This only applies if the person is already known to be HIV positive. Under this law none of these groups have the right to demand testing of an individual without his or her informed consent. Further, in the absence of a cure, testing the individual who is suspected of being positive, has very limited value to the person exposed. This is crucial to understand in taking a stand that in effect says: the right to privacy and confidentiality of the individual outweighs any benefit to the person who is exposed. This is especially true because the test is not foolproof and there is a window. The only way to be certain that an exposed person has not contacted the virus is for that person to be serially tested.

According to the present statue the only group that can be tested without consent are prisoners and this is a group who has abrogated their rights as citizens by having committed a crime.

C. Refusal of Treatment

This provision was originally opposed by the Medical and Chirurgical Faculty as unnecessary since our own Ethics committee, as well as the A.M.A., has already stated that fear of contagion is not grounds for refusal of treatment. This law brings licensed health occupations in accord with the Human Rights Commission. The original language of the bill was very broad and was narrowed only to individuals who are HIV positive. While many of us may feel that this provision is unnecessary, we feel that Med Chi policy should be to resist any attempt to repeal or alter it.

Medical and Chirurgical Faculty of Maryland

Physicians, as a group, have endured a great deal of adverse publicity and a tarnished image of the profession over those few individuals who have refused to treat patients who are HIV positive. We think that it would be much worse if we tried to repeal an already existing law. The public simply cannot reconcile physicians refusing to treat a sick, disabled, or otherwise handicapped person.

D. Partner Notification

In support of the Omnibus Bill, our attorneys are proud of the fact that we helped to introduce and pass a legal resolution to a great ethical dilemma. Physicians are now free to follow their judgement in informing partners of infected people (or asking the Health Department to do so), without fear of liability.

V. CONFIDENTIALITY LAW

We should join with most official bodies in strongly supporting a confidentiality law. The number one recommendation of the President's Commission on A.I.D.S. was a confidentiality law. The Governor's Advisory Council had the same recommendations. We believe that this issue has been emotionally missated by many people.

First of all, almost everyone agrees that such a law would protect the rights of individuals. The argument against it is that more disclosure and less confidentiality is in the interest of public health. We as physicians and scientists know that just the opposite is true, namely that more people would come forth for testing and treatment if there were a confidentiality law. We know numerous examples of people not coming forth in the absence of this type of law because they fear loss of job, insurance, social stigma, and other types of discrimination. The public interest would be greatly served by a confidentiality law. Because of it, we would be able to bring all of our citizens into proper testing and treatment.

Medical and Chirurgical Faculty of Maryland

VI. PHYSICIANS WHO ARE HIV POSITIVE

There was an attempt last year to introduce a bill governing physicians who are HIV positive. Some hospitals, including Cook county Illinois, have attempted to establish regulations that are much more emotional than scientific. For example, under this type of regulation any physician, regardless of specialty, would be prohibited from seeing patients.

A Hastings Center report (Jan./Feb. 1989) recommended that the practice of "seriously invasive procedures" be restricted for HIV positive physicians. This report opposes all mandatory testing of physicians.

It should be noted that transmission of HIV from a physician to a patient has never been documented.

We recommend that the Medical and Chirurgical Faculty policy for all contagious diseases should be that each one be handled on a case-by-case basis.

VII. MANDATORY CONTINUING MEDICAL EDUCATION ON A.I.D.S.

The States of Washington and Florida have mandated a certain number of hours of continuing education of A.I.D.S. for re-licensure. We recommend a Faculty policy in opposition to this requirement for A.I.D.S. and HIV infection.

VIII. REFUSAL OF TREATMENT BECAUSE OF A POSITIVE HIV ANTIBODY TEST

Although we already have a policy from the Ethics Committee, we recommend that Med Chi policy should be restated: no physician has the moral or legal right to refuse treatment of a patient because that individual is HIV positive.

Medical and Chirurgical Faculty of Maryland

IX. LIVING LONG AND LIVING WELL

The Committee on A.I.D.S. has established, as its theme, the principle that living long and living well is an idea whose time has come and that A.I.D.s (and HIV infection) should be looked upon as a chronic manageable disease Med Chi supports this principle.

X. MANDATORY REPORTING

Vigorously oppose mandatory reporting of asymptomatic individuals who are HIV positive because it will drive people away from testing and therefore be counter-productive to our basic goal of bringing people into care and treatment.

XI. COMMITTEE ON A.I.D.S.

As previously stated in our minutes, we recommend that the Committee on A.I.D.S. should represent Med Chi before the legislature.

Medical and Chirurgical Faculty of Maryland

Approved 10/19/89

Faculty Position

CHOLESTEROL TESTING

Written by: Herman C. Maganzini, M.D., F.A.C.P., Chairman

COMMITTEE ON PUBLIC HEALTH

Summary

The Committee on Public Health recommends that the Medical and chirurgical Faculty of Maryland adopt the following position on Cholesterol Testing:

1. Availability of Cholesterol Testing to all Maryland Citizens
2. Quality Assurance
3. Treatment Guidelines
4. Education & Referral

Position and Recommendation

I. AVAILABILITY OF CHOLESTEROL TESTING TO THE PUBLIC

A. The Medical and Chirurgical Faculty of Maryland encourages the availability of accurate and reliable cholesterol testing services to identify persons in Maryland whose blood cholesterol level places them at risk of developing coronary heart disease.

II. QUALITY ASSURANCE

A. Public screening provides the possibility of detecting large numbers of persons with high blood cholesterol levels in addition to those detected in the physicians office.

Assurances must be made that public screening programs and the technical component of cholesterol testing services operate under

qualified supervision, adequately trained personnel, reliable procedures, and an effective quality assurance program. Public screening programs must ensure that persons with identified high blood cholesterol receive proper follow-up with their private physicians and encourage public education about cholesterol.

B. 1. Med Chi supported SB 172 which requires a cholesterol testing permit to be issued for testing outside a permanently located laboratory.

2. Med Chi supports administrative regulations 10.10.04 Cholesterol Testing (Maryland Register, Vol. 16, Issue 13, June 30, 1989) implementing the statute.

3. Med Chi supports Guidelines for Cholesterol Screening Programs developed by the National Heart, Lung, and Blood Institute.

4. Med Chi joins with the Maryland Heart Association and with the Department of Health & Mental Hygiene in the encouragement of public cholesterol screening programs.

III. TREATMENT GUIDELINES

A. Adults

Med Chi endorses Adult Treatment Guidelines developed by the National Cholesterol Education Program:

"The ADULT TREATMENT GUIDELINES set new criteria for defining candidates for medical intervention. The new GUIDELINES recommend and elaborate on detection, treatment and follow-up methods, including a guide for dietary treatment. For case finding purposes, the initial classification based on total blood cholesterol is defined as follows:

Classification by Total Cholesterol

Desirable Blood Cholesterol - Below 200 mg/dl
Borderline-High Blood Cholesterol - 200-239 mg/dl
High Blood Cholesterol - Above 240 mg/dl

Recommended Follow-up

If Total Cholesterol is less than 200 mg/dl
....Repeat within 5 years

If Total Cholesterol is 200-239 mg/dl and there is no definite CHD or other CHD risk factors
....Provide dietary information and recheck annually

If Total Cholesterol is 200-239 mg/dl and there is definite CHD or two other CHD risk factors (one of which can be male sex)
....Provide lipoprotein analysis; further action based on LDL-cholesterol level

If Total Cholesterol is equal to or greater than 240 mg/dl
....Provide lipoprotein analysis; further action based on LDL-cholesterol level.

The cutpoint that defines high blood cholesterol (240 mg/dl) is a value above which risk of CHD rises steeply, and corresponds approximately to the 75th percentile for the adult U.S. population.

A new classification based on LDL Cholesterol is recommended as the key index for clinical decision making about Cholesterol lowering therapy. Patients warranting further assessment should be evaluated and treated in accordance with new risk classification for LDL Cholesterol, as follows:

Classification By LDL-Cholesterol

Desirable LDL-Cholesterol.....Below 130 mg/dl
Borderline-High Risk LDL-Cholesterol...130-159 mg/dl
High-Risk LDL-Cholesterol.....Above 150 mg/dl

Recommended Followup
Initiate Dietary Treatment if LDL cholesterol is 160 mg/dl or greater and patient has no definite CHD or other risk factors. Minimal goal is to maintain LDL cholesterol below 160 mg/dl.*

If LDL cholesterol is 130 mg/dl or greater and patient has definite CHD or two other risk factors. Minimal goal is to maintain LDL cholesterol below 130 mg/dl.

Initiate Drug Treatment if LDL cholesterol is 190 mg/dl or greater and patient has no definite CHD risk factors. Minimal goal is to maintain LDL cholesterol level below 160 mg/dl.*

If LDL cholesterol is 160 mg/dl or greater and patient has definite CHD or two other risk factors. Minimal goal is to maintain LDL cholesterol below 130 mg/dl.*

*Patients have a lower initiation level and goal if they are at high risk because they already have definite CHD, or because they have any two of the following risk factors: male sex, family history of premature CHD, cigarette smoking, hypertension, low HDL-cholesterol, diabetes mellitus, definite cerebrovascular or peripheral vascular disease, or severe obesity. As goals for monitoring dietary treatment, 160 mg/dl LDL Cholesterol is roughly equivalent to total cholesterol of 240 mg/dl; 130 mg/dl LDL Cholesterol is roughly equivalent to total cholesterol of 200 mg/dl."

*Guidelines of The National Heart, Lung, and Blood Institute, National Institutes of Health

B. Children

Med Chi supports the American Heart Association position on measuring blood cholesterol in children.

*"The American Heart Association stresses the importance of detection and treatment of children with inherited disorders of lipid and lipoprotein metabolism. The AHA does not recommend mass screening of plasma cholesterol for all children and adolescents. Rather, screening and case finding should focus on children at high risk - those aged two and over whose parents or grandparents have developed coronary heart disease or cerebrovascular disease before the age of 55 if male and 60 if female, or those who have a family history of hyperlipidemia.

Plasma cholesterol should be measured in these children and if greater than the 75th percentile for age, high density lipoprotein (HDL) cholesterol should also be measure. If HDL cholesterol does not account for the elevated total cholesterol level, dietary modifications according to AHA guidelines should be initiated.

These recommendations are based on the limited information available on routine plasma lipid screening in all children."

*Approved by the American Heart Association Steering Committee, May 1988.

IV. EDUCATION & REFERRAL

A. Information about blood cholesterol and coronary heart disease risk provided with cholesterol measurements can improve knowledge, attitudes, and health behaviors. Effective education requires knowledgeable, trained personnel supported by printed and possibly video materials suitable for the target audience.

Receipt of only a cholesterol number by a participant is not sufficient in a screening program. Screenees should be able to obtain verbal and printed information on blood cholesterol from screening center personnel. It is essential for public screening programs to provide education for all screenees who attend, regardless of their personal level of cholesterol.

B. Systems should be developed so that persons with elevated cholesterol seek referral and medical care through their private physician.

C. When adopted, the Med Chi white paper position will be distributed to all component and specialty societies, the Maryland Heart Association, Maryland Hospital Association, Maryland Association of Health Maintenance Organization, the Department of Health and Mental Hygiene; to all health care facilities with the technical capability to perform cholesterol testing.

PRESCRIPTION DRUG CONTROL AND DISPENSING

UMMARY

This paper is formulated to discuss the issues of prescription drug control and dispensing, particularly as it relates to the problem of drug abuse in general, which is the purview of the Committee on Drugs,

The issues are several:

1. The large morbidity and mortality associated with the use of prescription and nonprescription drugs in this country.

2. The issue of recreational use of drugs, most important numerically being alcohol, and the many other drugs which are both licit and illicit, primarily illicit.

3. The issue of drug addition and how to prevent and treat it.

4. The issue of law enforcement with regard to both illicit drugs and the diversion of licit drugs and the increasing mortality associated with the trafficking and law enforcement of drug abuse.

5. The issue of restricting the rational use of medicines.

The question of whether a governmental system which totally proscribes certain drugs and provides extreme restrictions on the prescription of others will reduce deaths and morbidity is an open one. There seems little doubt that our country has extremely prohibitive and restrictive laws and yet has a huge mortality associated with distribution networks of illicit drugs and also more than ten thousand deaths a year from drug overdose.

Medical and Chirurgical Faculty of Maryland

LEGISLATION

At this time, a system of triplicate prescription forms to be used by all physicians prescribing Schedule 2 controlled dangerous substances in the state of Maryland is under consideration. Schedule 2 substances include such drugs as: Morphine, Dilaudid, Methadone, Hycodan, Levodromorane, Percodan, Percocet, Tylox, Seconal, Neuhitol, Tuinol, Fentanyl, Dexedrine, and Ritalin. Such a system would provide a State three copy prescription blanks, one copy of which would be retained by the doctor, one copy to remain with the pharmacist, and the third copy to be filed by the Health Department in a computerized system. The rationale for instituting such a system is based on data, largely from the NIH DAWN Information System indicating, for example, that in 1985, 53% of all drug related emergency room visits and 49.6% of all drug related deaths involved licit prescribed medicines. It has been suggested that a triplicate system would lead to better control over the prescription and diversion of such drugs and thus contribute to decreased morbidity and mortality. This is misleading and not supported by the facts.

In actuality, according to DAWN from 1987, one-half of the drug mentions in emergency room deaths from overdoses are associated with tranquilizers (596); non-narcotic analgesics (388); non-barbiturate sedatives (219); anti-depressants (1037); anti-psychotics (147); "other drugs" (1048); and alcohol in combination (1730).

First of all, these are not Schedule 2 substances and would not be covered by the triplicate form. secondly, the mere mention of the drug in an overdose case does not imply that it was improperly prescribed. Ten percent of the deaths from overdose occur with anti-depressants. It is almost certain that the majority of such patients were depressed and were suicidal by the very nature of their illness. If we were to impose restrictions on the prescription of these drugs, how many more lives might be lost for lack of their marvelous anti-suicidal effects? The same may apply to the tranquilizers and others.

The proponents of a triplicate prescription form, claim it will give them data with which to track down physicians who are dishonest, disabled, deceived, or dated. It is implied that the legitimate prescribing of medication for the ill will not be affected. The data from states where triplicate is in effect demonstrate otherwise.

Thus, in states using triplicate blanks for Schedule 2 drugs, there is a decrease in the prescription of these drugs by thirty to 50% in the first two years after instituting such a system.

Only 21% to 35% of the state's duly authorized prescribers actually ordered the blanks to prescribe Schedule 2 medications at all. Meanwhile, in states where data is available, coincident with the great decrease in prescription of Schedule 2's such as Percodan and Dilaudid, there is an even greater increase in the prescription of class 3's, not covered by triplicate, such as Vicodin and Talwin.

There is a great disagreement among experts in medicine about the control of pain; but how anyone can believe on the face of it, that these kinds of data indicate improved treatment of pain, is inconceivable. I would like to quote from D. Russell Portenoy, Director of Analgesic Studies at Sloan-Kettering: "The implementation of a triplicate prescription system, for example, may be associated with a dramatic reduction in the prescription of opioids by practitioners, over 60% in one survey. Although the degree to which these systems limit appropriate prescribing has not been assessed, it is difficult to attribute a reduction in drug use of this magnitude to inappropriate prescribing, particularly in the LIGHT OF THE UNDERTREATMENT OF PAIN ALREADY EXTANT." (capitals are mine).

The DEA has indicated that they receive no complaints from physicians subjected to a triplicate system. In actuality, the threat to confidentiality was thought so great by a group of patients and physicians in the state of New York that they joined with two physicians organizations and brought suit against the state (Whale vs. Roe, 1977). This suit was lost on appeal to the Supreme Court, effectively squelching further complaints.

Medical and Chirurgical Faculty of Maryland

Most important, data evaluated by the AMA (Board of Trustees report: PP (A-89) demonstrates that there is no reduction in ER mentions of Schedule 2 substances in states where multiple copy prescriptions are in effect. Quite the contrary, whether heroin and cocaine (the most abused drugs) are included or not, there is a higher rate of emergency room mentions of Schedule 2 drugs in seven state where triplicate is in effect. In other words, triplicate may make it easier for the Health Department to put the finger on the physician, but it does not prevent the devastating effects of drug abuse. Its chilling effect on prescription practices affects the vast majority of legitimate practitioners and patients in order to catch a few who act improperly. Thus, it may, in effect, throw out the baby with the bath water.

POSITION

It is our understanding that the triplicate prescription plan is to be presented to the legislature this year by the Health Department and perhaps others.

The State Health Department appears to favor the triplicate plan; and we believe that they are supported by the DEA.

The AMA position is "to oppose expansion of the multiple-copy prescription programs. The multiple-copy prescription program has been documented as ineffective in reducing prescription drug abuse and their adverse effect on the availability of prescription medications for therapeutic use."

The Med Chi's Committee on Drugs recommends that the Faculty vigorously oppose the adoption of a triplicate prescription plan in our state for the following reasons over and above its demonstrated ineffectiveness in curbing drug abuse morbidity and mortality:

1. Invasion of patient's privacy is prime.

2. It is a misuse of funds. Funds for this program should be used to provide more treatment facilities for patients suffering from addiction.

3. There is the potential for altering the physician/patient relationship when the patient is advised that prescription information will be reported to the State Health Department.

4. There is the potential for extending the list to include other scheduled medications as they are doing in New York.

5. There is the potential of information being diverted to inappropriate sources.

6. We want to be certain that evaluation of physicians' prescribing practices is conducted by his/her peers. This is because of the wide variation of acceptable practices and disagreement among physicians on matters of appropriate use of controlled substances.

7. Collection of 100% of the data is costly and time consuming when only a very small portion of the providers will be sanctioned.

8. There is the potential for inhibiting the creative practice of medicine.

9. We also fear that physicians may be afraid to prescribe needed medications for fear their name will appear on some list.

10. We fear that some patients who are currently receiving these medications under medical supervision may turn to the streets for drugs if physicians refrain from prescribing.

We also recommend that the Faculty continue to pursue its present plans to develop education programs for prescribing physicians on the issues of drug abuse and its treatment. We are meeting with representatives of Johns Hopkins, University of MD, NIH, Baltimore City Health Department, and the Governor's Commission on Drug Abuse to begin work on a model course in late September of this year.

RECOMMENDED ACTION

We should involve the support of other interested and concerned organizations such as the pharmacy, psychiatric, pharmaceutical manufacturing, oncology, and perhaps, civil rights groups in our efforts to oppose this triplicate plan. It might be advisable to supply literature on this matter to our legislators so that they understand the implications of the Health Department and the Governor's office to explain our position. If necessary, we should bring expert witnesses, such as Dr. Portenoy of Sloan-Kettering, to add their views.

Medical and Chirurgical Faculty of Maryland

The institution of triplicate prescription system in our state will affect the prescribing habits of all practicing physicians for the indefinite future in a manner which is entirely geared to discovering the few physicians who are derelict in their practices. The demonstrated ineffectiveness of triplicate in reducing morbidity and in saving lives and its potentially devastating and sweeping effects of legitimate prescribing practices constitutes a major threat to adequate and proper patient care.

Faculty Position

THE PROBLEM OF THE UNINSURED

Summary

National Data

1. In 1987 37± (36.8) million people in the U.S. were uninsured (excludes those covered by private insurance, Medicaid, Medicare, Champus, Champus/VA etc.)

2. This is 15.5% of the 1987 population of U.S. (versus 12.3% in 1977)

3. 17.4% of the population is less than 65 years of age (or 36.5 million people - since Medicare covers most persons over age 65.)

4. Employed Uninsured
   a. 15.7% of all employed workers or their dependents are uninsured (28.6 million)
   b. This number constitutes 78.3% of all uninsured people under 65 years of age.

5. The other 20+% of uninsured persons are unrelated to an employed adult.

Maryland Data

1. 14.1% of the population, of less than 65 years is uninsured (approximately 573,000 of 4.1 million).

2. Data relating this group to employment in the

   family is presently unavailable but 66% of uninsured adults (18-64 years old) in Maryland are employed (265,000/401,000)

Individuals & Groups involved who have made recommendations or even proposed legislation to accomplish their desired results include:

Senator Edward Kennedy, Rep. Henry A. Waxman, Rep. Don S. Pease, Rostenkowski, Professors Enthoven & Kronich (Stanford University), Social Security Advisory Council, Bipartisan Commission on Comprehensive Health

Medical and Chirurgical Faculty of Maryland

Care ("Pepper Commission"), Physicians for a National Health Program, The National Leadership Commission and the A.M.A. at the national level, and Governor Schaefer's commission on Health Care Policy Financing ("Feinblatt Commission"), "Subcommittee on the Uninsured" (Chairman, Rev. Joseph A. Sellinger), Advisory Board on the Uninsured - Department of Economic & Employment Development (Senate Bill 292) at the state level in Maryland.

Eligibility requirements vary from all the uninsured in the country or state to various special subgroups such as uninsured children, uninsured college students, uninsured/unemployed adults etc.

Proposed Methods of Health Care Delivery

1. Mandate managed care exclusively.
2. Continue multiple delivery systems to include managed care, private physicians and hospitals.

Payment Options and Funding

1. Universal Health Insurance with the federal government being the sole payor.
2. Continue private commercial insurance only with payment vouchers for Medicaid and Medicare.
3. Mandated employer paid benefits with tax incentives.
4. Combination plans with government, employers and individuals paying in proportion to need (including a means test for Medicare).
5. Expanding Medicaid eligibility levels to 100% of Federal Poverty Income Level.
6. Federally legislated basic health coverage using commercial insurance and a mandated fee schedule for physicians and lump sum payments to hospitals.

7. Catastrophic insurance with caps to a maximum outlay of 2500 or 3000 dollars.

8. Increase cigarette and alcohol tax to raise revenues for health care.

Position

Conclusions

These health care financing and access problems are evoking increased concern and action at all levels of government and even more so, big business. Some change will certainly be forthcoming. It is imperative that all physicians in the State of Maryland (and nationwide) become more involved in the development and implementation of new proposals, if the solutions are to be successful. We must not allow economics to be the paramount driving force in these deliberations (as it seems to be in many such proposals). If it is, then the competent and compassionate health care which our patients should have and which we have always given will no longer be possible.

Recommendation

The Medical and Chirurgical Faculty of Maryland supports the following positions:

1. There should be universal access to health care and universal coverage for all Americans. Universal access and coverage is not the same as universal health insurance and the two should not be confused.

2. In an attempt to cover the uninsured population of America, we endorse the concept that requires employers to provide health insurance coverage through the private sector for all full-time employees (greater than 17 1/2 hours per week). This coverage should be phased in gradually and should begin with larger employers. However, the problem will not be solved until smaller employers are included since 48% of the uninsured work for employers with less than 10 employees. This program should include the development of a package of Basic Health Benefits.

Medical and Chirurgical Faculty of Maryland

3. Employers should be provided with a program of tax credits, premium deductibility and other incentives to avoid adverse effects on employers, especially the small employer.

4. The Medicaid Program must be reformed to include 100% of the individuals below the federal poverty level. This reform should include uniform eligibility on a national basis; national standards of uniform minimum adequate benefits; eliminate existing categorical eligibility requirements; and provide adequate hospital and physician reimbursement to assure broad access to care.

5. State-level insurance risk pools should be established to provide coverage for those individuals above the poverty level and unemployed or self-employed. Insurance should be through the private insurance sector with premium subsidies for those near the poverty level. All insurance providers in the state must contribute to the risk pools for them to be successful.

6. Self-employed individuals should also be permitted 100 percent deductibility of health insurance premium as are corporate businesses.

7. Physicians should support increased taxes on alcohol and tobacco products with proceeds being directed to finance health care programs and research.

This policy would provide comprehensive insurance coverage through the private sector to all Americans. Universal access to care would also be available. The cost of such a program would be spread across the entire spectrum of America.

Clinic Director

Prestigious national group specializing in the treatment of venous disorders is expanding in Maryland. We are in need of physicians trained in internal medicine, surgery or who have a broad based medical background to establish and direct a clinic as well as practice our state of the art treatment techniques. We will provide complete training in the latest proprietary techniques of treating venous disorders. We offer an outstanding compensation package in the high six figures area along with malpractice insurance and health benefits. Additionally, we offer a 40 hour work week, no weekend hours and freedom from beepers. You also won't have to worry about soliciting for patients or fighting insurance companies.

This is an outstanding opportunity for professional and financial advancement. If you are motivated to build a rewarding practice with the leader in the treatment of venous disorders, send your curriculum vitae to:

The Legislative Process*

From Hopper to Enactment

The drafting of legislation requires the skill of experienced and trained personnel. This service is rendered by the Department of Legislative Reference. A bill or joint resolution may be introduced in advance of regular sessions and is styled a "prefiled bill." A bill is filed ("is dropped into the hopper") with the Secretary of the Senate or the Clerk of the House, is given a number, and is readied for its first reading on the floor. Bills may be introduced in either chamber until the last 35 days of the session. After that, bills may be introduced only with the consent of two-thirds of the membership.

First Reading The Reading Clerk, when the session has convened, reads the title and the presiding officer assigns the bill to the appropriate committee.

Reference to Committee The committees meet daily during the session to receive testimony and take action on bills assigned. Citizens are encouraged to present their views on the subject matter by mail or by personal appearance. Legislative agents (lobbyists), representing organized interest groups, speak at these hearings, either to oppose or support the proposed legislation. The Department of fiscal Services prepares a fiscal analysis for each bill and these fiscal notes are considered during the committee deliberations.

Unfavorable committee action, which may mean legislative "death," frequently requires as much, or more, committee discussion and time as favorable committee action, which sends the bill to the floor for second reading and floor consideration.

Second Reading and Floor Consideration The bill is reported to the floor by the committee (favorably, unfavorably, or without recommendation, nd with or without committee amendment). It is open to amendment from the floor, and the ultimate form of the bill must be determined on second reading. Committee action may be reversed but this is infrequent.

Third Reading The bill must be printed for third reading with all amendments included in this final version. No amendments may be presented on third reading in the chamber of its origin, and the bill must be passed by a majority of the elected membership.

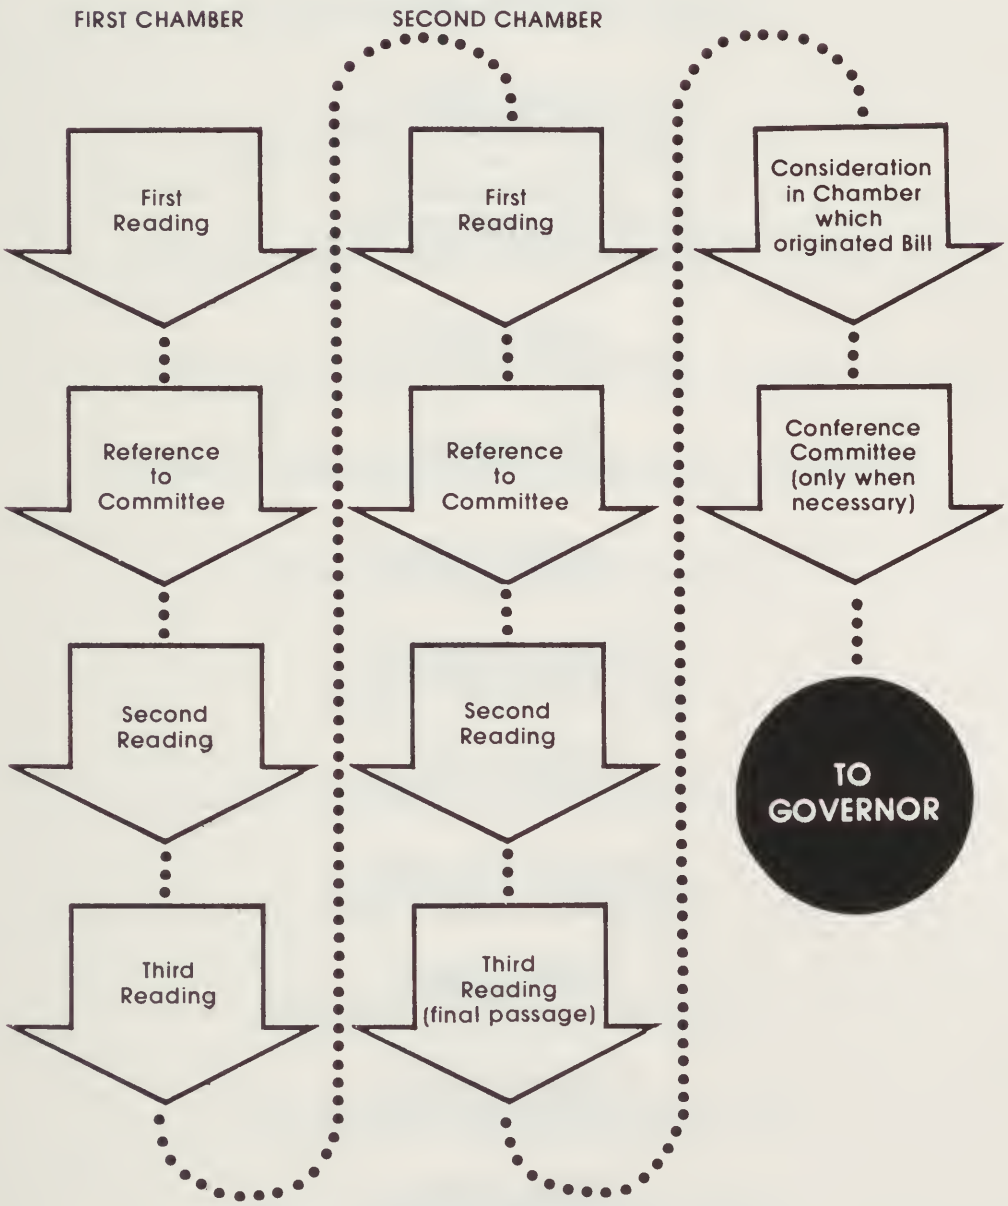
Second Chamber The procedure follows a pattern identical with that of the chamber in which the bill originated, except amendments may be proposed during third reading as well as second reading. If not amended in the second chamber, final passage may occur without reprinting.

*Information provided by the State of Maryland Department of Legislative Reference, F. Carvel Payne, Director.

Consideration of Bills

Consideration of Bills Originating in One Chamber and Amended in Second Chamber

If amended in the Second chamber, the bill is returned to the chamber of origin where a vote is taken on a motion to concur or reject the amendments. If concurrence is voted, the bill itself is voted on as amended and action is complete. The bill is reprinted, or enrolled, to include the added amendments before submitting it to the Governor.



If the amendments are rejected, two courses of action are possible: 1) the amending chamber may be requested to withdraw its amendments, or 2) upon refusal of withdrawal of amendments, either chamber may request a conference committee to resolve the differences between the two chambers.

Conference Committee A report of a conference committee goes back to both chambers to be adopted or rejected without amendment. If the Conference Committee report is adopted, the bill is voted upon for final passage in each house. If the Conference Committee report is rejected by either house, the bill fails.

Presentation of Bills to the Governor Presentation of all bills, except the budget bill and constitutional amendments, to the Governor is mandatory. The budget bill becomes law upon its final passage and cannot be vetoed. Bills must be presented to the Governor within twenty days following adjournment of a session, and in the case of such bills, the Governor may veto within thirty days after presentation to him. If he does not veto a bill it becomes a law. He may not veto a constitutional amendment.

The Power to Override a Veto rests with the Legislature. If a bill is vetoed during a regular session, the veto message is considered immediately. If a bill presented after the session is vetoed, the veto message must be considered immediately at the next regular or special session of the Legislature, except that the Legislature during the first year of a new term may not override a veto. A three-fifths vote of the elected membership in each chamber is necessary to override a veto.

The Epidemiology of AIDS in Maryland, 1981 - 1987

Joseph T. Horman DVM, MPH; Ebenezer Israel MD, MPH; and Gillian Ann van Blerk MD, MPH

From 1981 through 1987, a total of 1,068 AIDS cases were diagnosed in Maryland; 62.8 percent occurred in the homosexual/bisexual male cohort followed by intravenous drug abusers, 21.8 percent. Time trends suggest that proportionally fewer cases of AIDS will occur among homosexual/bisexual males and transfusion patients, and more cases will appear among intravenous drug abusers and heterosexuals.

The February *Maryland Medical Journal* will be devoted to AIDS and HIV Infection: Living Long and Living Well, a group of articles compiled by Med Chi's Committee on AIDS, Chairman Donald M. Pachuta MD. The following article from Maryland's Department of Health and Mental Hygiene tracing the incidence of the appearance of AIDS as a reportable disease in this state serves as an introduction to next month's special issue.

Drs. Horman and van Blerk are with the AIDS administration, and Dr. Israel is with the Epidemiology and Disease Control Program, Maryland Department of Health and Mental Hygiene, 201 W. Preston St., Baltimore, MD 21201.

Although a new illness, Acquired Immune Deficiency Syndrome (AIDS), was first described in June 1981,[1] Maryland's first case was reported in October 1981. In June 1983, confirmed AIDS was made a reportable disease in Maryland. Through May 31, 1989, 1,752 cases were reported to the Maryland Department of Health and Mental Hygiene (DHMH), amounting to slightly more than 3.5 of every 10,000 Marylanders. Maryland's cumulative case rate of 174 per million population ranked seventh (as of November 2, 1987) among all states (including District of Columbia).[2] AIDS has had and is continuing to have dramatic political, economic, and social impact on Marylanders. Understanding the dynamics of the epidemic is important in developing and implementing a response to the outbreak. We describe the AIDS epidemic in Maryland for the period 1981 through 1987.

Methods

AIDS cases are reported by health care providers to DHMH, examined for completeness of pertinent information, and entered into the case registry if the Centers for Disease Control (CDC) surveillance case definition is met. The case definition has changed several times, and efforts have been made to update older data to the new case definition.

Two additional surveillance systems are used to enhance reporting by physicians. In Maryland counties, hospital infection-control practitioners are an important source of AIDS case reports. In Baltimore City, reporting of laboratory evidence indicative of

possible AIDS is the primary method for identifying AIDS cases. A validation study using hospital discharge data for the years 1985 through 1987 suggests that 96 percent of all cases are found through the current reporting systems.

All AIDS cases reported (as of March 15, 1989) with a diagnosis during the period 1981 through 1987 are included. The year 1988 is excluded since case reporting at this writing is not nearly as complete for 1988 as for prior years. For some analyses, data for the periods 1981-1984 and 1985-1987 are examined in an effort to eliminate the problem of the small number of cases in the earlier years. In regard to exposure category, cases with more than one risk factor are tabulated only in the category listed first except for the category "IVDA, homosexual/bisexual male."

Results

From 1981 through December 31, 1987 a cumulative total of 1,068 cases were diagnosed in Maryland. Of these, 1,017 were nonincarcerated adults, 28 incarcerated adults, and 23 children. The pediatric cases are discussed separately and are not included in the data presented unless so indicated.

The number of new cases has increased each year (Table 1), but the rate of increase generally has declined. An exception occurred between 1986 and 1987 when there was a slight increase as compared to the previous years. Possibly the broadening of the case definition in 1987 accounted for this. Maryland's share of the national cumulative total of reported cases through 1987 (59,265) was 1.7 percent, ranking it eleventh. [3]

Geographical Distribution

All but one Maryland jurisdiction reported AIDS cases (excluding cases incarcerated at time of diagnosis) (Figure 1); however, 79 percent resided in three subdivisions: Baltimore City, and Prince George's and Montgomery counties. Cases are clustered in the urban and suburban areas of Maryland.

The state's overall cumulative case rate per million population was 234 for nonincarcerated adults (Table 2), while the rate for all adults was 240 (Table 3).

Table 1. All Adult AIDS Cases, by Year of Diagnosis Maryland, 1981 - 1987

Year of Diagnosis	Number of Cases		Cumulative Number of Cases
1981	4	(4)	4
1982	6	(6)	10
1983	32	(32)	42
1984	84	(81)	126
1985	193	(173)	319
1986	277	(210)	596
1987	449	(269)	1,045

Figures in parentheses equal number deceased as of 2/28/89

Baltimore City had the highest rate of 527 followed by 355 for Prince George's County (Table 2). The small rural county of Caroline was third with a cumulative incidence rate of 337. The rates ranged from Queen Anne's 0 to Baltimore City's 527.

Exposure Categories*

The majority (67.5 percent) of AIDS cases in Maryland occurred among homosexual/bisexual males (including homosexual/bisexual male Intravenous Drug Abusers [IVDAs]) followed by 17.1 percent in heterosexual intravenous drug abusers (Table 4). Maryland's percentage breakdown by exposure category differed somewhat from the national statistics. Maryland had a greater proportion of transfusion and heterosexual contact cases and slightly less homosexual/bisexual males and IVDAs.

Homosexual/Bisexual Male From 1981 through 1987, 656 homosexual/bisexual male cases (62.8 percent of total) were diagnosed in Maryland. Over these years, the proportion of cases in this category has declined (Table 5). For the years 1981 through 1984, the proportion of homosexual/bisexual males comprised 69.4 percent of the total cases, whereas for the years 1985-1987 this had declined to 61.9 percent. However, if the IVDA homosexual/bisexual category is included with the homosexual/bisexual male category the decrease was less, from 71.8 percent to 66.9 percent.

Intravenous Drug Abuser (IVDA) Twenty-two percent (228) of Maryland's cases were IVDAs (both homosexual/bisexual and heterosexual male) compared to 25 percent of national cases (Table 4). Twenty-two cases occurred during 1981 through 1984 and 206 for the period 1985-1987. The proportion of male heterosexual IVDAs remained stable for the period 1981-1984 versus 1985-1987 (Table 5). However, both female IVDA cases and homosexual/ bisexual male IVDA cases increased during these time periods. Overall, the proportion of IVDA cases increased from 17.7 percent in 1981-1984 to 22.4 percent in 1985-1987.

* Since populations at risk are not known for the various categories, data are presented as percentage of the total reported and not as case rates (that is, case per 1,000,000 population).

* Based on 1984 estimated population.

Recipients of HIV-Infected Blood and Blood Products Maryland's first transfusion-associated male case was not diagnosed until 1983 (for female, 1985). Since then, the number of cases attributable to blood transfusion has increased steadily although the proportion of the total is relatively small at 6.2 percent (Table 4). However, Maryland's proportion was different than that nationwide, 2 percent. In 1985, 7.8 percent (15 cases) of all Maryland cases were attributable to blood transfusion. In 1987, this had declined to 6.0 percent (27 cases) of the total. Approximately 44 percent (14 cases) of white female cases were due to transfusion (Table 4). A total of 10 cases in hemophiliac patients were reported.

Heterosexual Contact This exposure category ranked fourth in terms of number of cases, accounting for 56 or 5.4 percent of the total (Table 4). The number of new cases has increased slowly but steadily since 1983 when the first case in this category was diagnosed in Maryland. Proportionally, this exposure category represented 5.6 percent of those diagnosed in 1981 through 1984 versus 5.3 percent in 1985-1987 (Table 5). Thirty-three (59 percent) of the 56 total were female. Of these, 16 were included in this category by virtue of no-risk category other than being born in countries where heterosexual HIV transmission is believed to be common. The proportion of male cases for the period 1981-1984 (3.2 percent) decreased in comparison to the proportion in 1985-1987 (2.1 percent). The proportion for female cases increased (2.4 to 3.2 percent). Heterosexual contact accounted for 25 percent and 32 percent of the white female and black female cases, respectively (Table 4).

Undetermined Since 1981, 30 cases have been listed in the "undetermined" category meaning that for

various reasons (for example, died before interview, refused interview, no admitted risk) a risk factor could not be determined for these cases. Twenty-six (2.8 percent) of 937 males and 4 (3.7 percent) of 108 females fell into this category. The proportion of "undetermined" has decreased since 1981-1984 (4.0 percent) compared to 1985-1987 (2.7 percent) (Table 5).

Geographic Variations

Comparison of exposure category by geographic area of the state (Table 6) revealed that over half (54.7 percent) of the IVDA cases (both homosexual/bisexual male and heterosexual) resided in Baltimore City. An additional 25 percent of IVDA cases resided in either Prince George's or Montgomery counties. A majority of the remaining exposure category cases resided in Prince George's or Montgomery counties. For example, 45.3 percent of blood transfusion cases and 66.6 percent of hemophiliacs resided in either Montgomery or Prince George's counties. The less populous geographic regions contributed a relatively small proportion of the total cases in any exposure category. In fact, the highest proportion was Eastern Shore's 14.5 percent share of heterosexual cases.

Race In Maryland, blacks and other minorities have been disproportionately impacted by AIDS. The cumulative incidence rates in blacks was 542 per million, over 3.5 times that for the white population (Table 3). The "other"** minority rate was 283 per million or twice that for whites. The 537 cases among blacks represented 51.4 percent of the total cases; yet blacks comprised only 22 percent of Maryland's population. Black women and men accounted for 83 percent of IVDAs cases (both IVDA exposure categories) and 71 percent of the cases due to heterosexual contact. Whites pre-dominated in the exposure cate-gories dealing with blood and blood products and homosexual/ bisexual males. Black cases were more likely to be "undetermined" than white cases. The proportion black was 57.1 percent for the years 1981 through 1984 and decreased to 50.5 percent for 1985-1987 (Table 7).

The majority of the black cases occurred in urban areas. However, cumulative incidence rates for blacks were unexpectedly high in

Table 5. Distribution of All Adult AIDS Cases by Exposure Category and Year of Diagnosis Maryland, 1981 - 1987 (Percents)

** Other minorities excluding blacks.

some rural counties on Maryland's Eastern Shore. For example, Caroline and Dorchester counties had rates of 1,266 and 503 respectively (compared to Baltimore City's 622) (Table 2).

Gender Of the adult cases, 10.3 percent (108) were female (Table 7). The male-to-female case ratio was 8.7. Temporally, the percentage of female cases had increased from 6.3 percent for the years 1981-84 to 10.9 percent for 1985-1987. Approximately 70 percent of the female cases were black as compared to 49.3 percent of the males. The major risk factor for females was heterosexual IVDA (48.1 percent), followed by heterosexual contact (30.6 percent) and blood transfusions (17.6 percent). If only white females were considered, almost 50 percent had blood transfusions as a risk factor (Table 4) as compared to 6.7 percent for black females. Of black females, 60 percent were heterosexual IVDAs.

Seventy percent of male cases were homosexual/bisexual males. White males had a higher percentage in the homosexual/bisexual male and transfusion categories as compared to black males who had more IVDA and heterosexual contacts. White males had a higher percentage of Kaposi's Sarcoma (KS) as compared to black males (Table 4).

The overall cumulative incidence rate for males was 444 per million versus 48 for females (Table 3). Both black males and black females exceeded the cumulative incidence rate for white males and white females by 3.5 and 7.6 times, respectively.

Age Of adult cases, 448 (42.9 percent) were 30 to 39 years of age (Table 4). Only seven cases were between 13-19 years of age. Of these, four were transfusion related, two IVDAs, and one heterosexual. Whites, particularly white females (37.5 percent) were more likely to be over age 49 as compared to blacks. Maryland tended to have a greater proportion in the over 49 year age category than did the US as a whole. The majority of women were in their reproductive years.

Mortality Through February 28, 1989, of the 1,045 AIDS cases diagnosed in 1981-1987, 775 (74 percent) have died. The mortality rate increased as the interval from date of diagnosis increased (Table 1).

Disease at Diagnosis Of the 1,045 total cases, 10 percent had an initial diagnosis of Kaposi's Sarcoma, 31 percent other opportunistic infections, and 59 percent, *Pneumocystis carinii pneumonia* (PCP). This breakdown was not too different than national statistics (Table 4).

Pediatric Cases Through 1987, 23 pediatric cases (less than 13 years old) have been diagnosed in Maryland (Table 8). Eighteen (or 78 percent) were infected perinatally by a mother who was infected or at risk of infection with HIV. The remaining 5 patients

Year	Number		Cumulative Total
1983	1	(1)*	1
1984	1	(0)	2
1985	7	(4)	9
1986	5	(5)	14
1987	9	(5)	23

* Figures in parentheses equal number deceased as of June 20, 1989.

(22 percent) were infected by blood transfusion. Fourteen (61 percent) were less than 12 months old; the oldest was five years old. Fifteen (65 percent) were male. Seventeen (75 percent) were black, 5 (22 percent) white, and 1 (4 percent) Hispanic. Eleven (48 percent) were diagnosed with PCP and the remainder (52 percent) with other opportunistic infections. Twenty-one (91.3 percent) had been diagnosed since 1984. Fifteen (65.1 percent) were reported from Baltimore City, five (24.6 percent) from Prince George's County, and one each from Anne Arundel, Montgomery, and Talbot counties.

Discussion

During the first seven years of Maryland's epidemic of AIDS, the number of new cases has increased each year. Given a median incubation of perhaps seven years or longer, cases should continue to increase since future cases are already infected. Although the rate of increase is difficult to predict, the trend is downward. If one applies Maryland's current 1.7 percent share of the national total to the predicted 270,000 US cumulative total by the end of 1991,[4] Maryland will have 4,590 cumulative cases at the end of 1991. This means that 3,522 new cases should occur during the three-year span of 1988, 1989, and 1990.

Although blacks represent only approximately 22 percent of Maryland's population, over 50 percent of the patients have been black. Blacks accounted for over 80 percent of the IVDAs and approximately 70 percent of the cases due to heterosexual contact. Since time-trend data suggest that proportionally more Maryland cases will occur in these exposure categories (IVDAs and heterosexual contact) and less in the homosexual/bisexual male and blood transfusion exposure categories, one would expect the imbalance among blacks to worsen in the future.

The fact that Maryland had a greater proportion (6.2 percent) of blood transfusion-associated cases than the national distribution (2 percent) is difficult to explain. Male transfusion-associated cases outnumbered females by 2.4 times. However, for white females, over 40 percent of the cases were due to blood transfusion in contrast to black females where this accounted for 6.7 percent of the cases. In an attempt to examine this issue more closely, cumulative incidence rates by sex and race (Table 9) were developed based on

Table 9. Transfusion-Associated Cases by Race and Sex Maryland, 1981 - 1987

	Population	Transfusion Cases	Rate/ Million*
White	3,249,780	55	16.9
Black	990,137	10	10.0
	4,239,917		
White male	1,583,560	41	25.8
White female	1,666,220	14	8.4
	3,249,780		
Black male	472,539	5	10.5
Black female	517,598	5	9.5
	990,137		

* Based on 1984 estimated population.

Maryland's estimated population. With this simple analysis, one notes that rates among black females, white females, and black males do not differ dramatically. Only white males have a dramatically higher rate. Why Maryland had a higher proportion of transfusion-associated cases than the entire United States warrants further investigation. However, on a practical basis, it may be a moot point since the testing of donated blood should essentially eliminate new additions to this exposure category at some future date.

Geographic areas of Maryland have not been evenly impacted by the AIDS epidemic. The great majority of the cases has occurred in the three subdivisions: Baltimore City (39.3 percent of total cases), Prince George's County (23.5 percent) and Montgomery (16.3 percent). However, cumulative incidence rates do not follow in parallel since some of the rural counties have high rates but a relatively low number of cases, particularly in the black populations. For example, Caroline County reported only 8 cases, but due to its relatively sparse population (around 20,000), the overall cumulative case rate was 337 per million. The rate among black adults in Caroline County was 1,266 per million. Perhaps further analysis of the data will help explain this observation.

Cases among IVDA and homosexual/bisexual males were concentrated in the metropolitan areas (Table 6). This probably reflects the fact that persons practicing risks associated with these exposure categories also are clustered in these areas.

Analysis of the data for time trends suggests that a greater proportion of the future cases will be IVDA and heterosexual contact cases and fewer homosexual/bisexual men and transfusion-associated cases. More will be female. Although comparison of the periods 1981 through 1984 and 1985 through 1987 for trends regarding race would suggest a decrease in the proportion black (55.1 to 50.6 percent), 1984 had an unusually high percentage of blacks (63.1 percent), which affected the 1981 to 1984 period value. The reason for 1984's high proportion of black patients is not known.

If this exception is disregarded, the trend reflects a steady increase in the proportion of black patients.

For the category "IVDA, heterosexual," the national ratio of male to female approximates 3.3; Maryland's corresponding ratio is 2.4. That females account for a greater proportion of Maryland's heterosexual IVDAs AIDS cases merely may reflect the sex ratio of IVDAs in Maryland. Sufficient information is not currently available to confirm this or to offer an alternate explanation. However, most of the female patients are of childbearing age. This increases the possibility of proportionally more pediatric cases in the near future.

Summary

In summary, surveillance data on AIDS cases has shown a shifting pattern in the AIDS epidemic in Maryland for the period 1981 through 1987. The proportion of homosexual/bisexual male cases and transfusion-associated cases decreased while the proportion of IVDA and heterosexual contact cases increased. The percentage of female cases steadily increased as did the proportion of black cases. Although cases were clustered geographically in Maryland's more populous areas, some small rural counties had relatively high incidence rates, especially among the black community.

CDC's case definition is in reality a surveillance definition identifying the terminal stage of a disease process that began anywhere from two to ten years ago (or longer) at the time of infection. Although information about cases is valuable, it does not give an accurate reflection of what currently is happening in the way of transmission of HIV infection. More recent information about HIV infection can be obtained by conducting serosurveys in various populations. Repetition of these surveys also provides information about incidence. The AIDS Administration is either conducting or planning a number of serosurveys that should answer questions about the current status of HIV infection and transmission in various Maryland populations.

Addendum

Preliminary results from 1988 AIDS case reports support the epidemic trends noted here (see Table 10 and Figure 2). The proportion homosexual/bisexual male cases has continued to decrease as has transfusion-associated cases, whereas IVDA and heterosexual contact cases have increased. Black cases represented 59.6 percent of the 1988 total and female cases, 14 percent, both fairly substantial increases and in accordance with the trends noted for 1981 through 1987.

Table 10. All Adult AIDS Cases by Exposure Category and Year of Diagnosis Maryland, 1981-1987 and 1988

Exposure Category	1981-1987	1988*
Homosexual/bisexual male	62.8	55.0
IVDA, heterosexual	17.1	24.4
IVDA, homosexual/bisexual male	4.7	6.6
Hemophiliac	0.9	0.7
Heterosexual contact	5.4	6.6
Transfusions	6.2	3.8
Undetermined	2.9	2.8
Total number of cases	1,045	573

* Preliminary data as of 9/30/89

Diabetic Retinopathy

Doctor, I have had diabetes for seven years and I see fine, but I have heard from friends who have diabetes that vision can be severely affected by diabetes. What are the complications that can occur, and what part of the eye is affected? Can complications be prevented?

The majority of patients with diabetes continue to see well throughout their lives. As in other complications associated with diabetes, patients with Juvenile Diabetes (Type I) are more severely affected than those with Maturity Onset Diabetes (Type II).

Although many conditions of the eye can develop as a result of having diabetes, including cloudy vision due to cataracts and double vision as a result of eye muscle weakness, perhaps the most difficult complication to treat is diabetic retinopathy.

In diabetic retinopathy, small, fragile new vessels develop in the retina as the result of insufficient oxygen supplied to the retina. The vessel walls thickened by diabetes do not allow oxygen to reach the tissues as easily as they would otherwise. In an attempt to compensate for this, new vessels bud out from the vascular tree. Unfortunately, these new vessels are not very sturdy and tend to leak and even rupture. The porosity of the vessels allows serum to leak through their walls and create exudates that then can block vision. In more advanced states of this condition, fragile vessels actually rupture and tear, causing bleeding either within the retina itself or within the vitreous cavity. This decreases vision markedly if it is in front of the macular area.

About 50 percent of patients who have had diabetes for at least 12 years will have some evidence of diabetic retinopathy. Very often in the early stage the changes are minimal and do not seriously affect vision. If the condition progresses to the point there is macular edema or multiple new vessels with evidence of hemorrhage, treatment is undertaken. Initial treatment consists of Argon Laser photocoagulation of retinal tissue. This has the effect of decreasing demand for oxygen and, possibly with some intermediate steps, causes the new fragile vessels to cease to grow and to atrophy.

Unfortunately, this is not a cure for the disease but rather a means of slowing and sometimes halting progression. The use of the laser for this treatment doubles the chance of retaining good usable vision. This still leaves more than 50 percent of patients susceptible to further episodes of bleeding and edema.

When bleeding first occurs, it usually clears, allowing the patient to see reasonably well again. However, after multiple bleeds there may come a time when clearing does not take place. In this situation, vitrectomy is performed, during which blood, vitreous, and often vessels that have grown into the vitreous are removed from the eye. There is a moderate success rate with this procedure, although a variety of complications can develop.

For early detection of diabetic retinopathy and other conditions affecting the eyes of diabetic patients, they should be seen yearly by their ophthalmologists. The physician managing the diabetes should maintain good glycemic control and examine the fundi between visits to the ophthalmologist. Early recognition and treatment will improve the chance of maintaining good vision.

David Murray, Dr. Yow, Dr. Atkins and Angelo Troisi at press conference.

Medical Mutual Liability's Chairman, Dr. Raymand Yow, announces dividend credit during press conference.

Medical Mutual Announces Dividend Credit for 1990

As a result of tort reform legislation, the Medical Mutual Liability Insurance Society of Maryland announced on October 12, 1989 that it will offer a 20 percent dividend credit in liability insurance rates for all Medical Mutual members who renew their policies in 1990. Raymond M. Yow MD, Chairman of the Board and Chief Executive Officer for the Medical Mutual Liability Insurance Society of Maryland, the largest insurance provider for Maryland physicians, made the announcement at a press conference held at Med Chi. Dr. Yow stated this one-time credit is in addition to any other discounts a member may be eligible to receive.

Dr. Yow also announced that the maximum charge for the Rate Stabilization Reserve Fund (a reserve fund designed for potential increases in the number of claims filed based upon actuarial input) for all policies will be reduced to 15 percent as of January 1, 1990, down from the current maximum of 24 percent.

The dividend credit and reduction in the Rate Stabilization Reserve Fund are the direct results of the cumulative effects of tort reform and insurance legislation enacted by the Maryland General Assembly over the last several sessions. Since the enactment of this legislation, Medical Mutual has passed the benefits of tort reform to its members. In November 1988, Medical Mutual offered a 10 percent discount to all its policyholders who renewed their policies in 1989, and in April 1989 the company did not seek a rate increase for its more than 5,700 member physicians.

During the press conference, Dr. Yow said that the health care community is indebted to the General Assembly for making tort reform possible. "Their appreciation of the very technical but very important issues involved have produced the kind of benefits that we hoped to see for our members."

Dr. Yow also commended the efforts of Governor William Donald Schaefer and Lieutenant Governor Melvin Steinberg along with the legislative leadership for their concern for quality health care and their efforts to stabilize the present liability environment. In addition, Dr. Yow thanked Med Chi's President, Raymond M. Atkins, MD and Executive Director, Angelo J. Troisi, FACHE for their continued efforts to keep the issue of tort reform at the forefront of the legislative agenda.

"We promised the General Assembly—and the thousands of Maryland physicians who depend on Medical Mutual for their liability insurance—that we would pass along any financial relief that resulted from tort reform," said Dr. Yow during the conference. "Because we are a mutual company, these financial benefits are passed directly to our members, rather than to stockholders or other investors."

Officials from Medical Mutual and Med Chi expressed hope that more obstetricians will be able to go back into the profession because of this action. According to Dr. Yow, the average obstetrician in Maryland pays about $70,000 a year in malpractice insurance premiums. As a result of the discount, an obstetrician could save about $14,000 annually. Obstetricians who have been Medical Mutual members for five years or more, the reserve fund fee would drop from 19 to 10 percent.

Several local media representatives covered the press conference including reporters from the *The Evening Sun*,*The Baltimore Business Journal*,*WBAL Radio* and the Associated Press.

The story appeared on the front page of *The Baltimore Sun* on October 13, 1989. ■

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

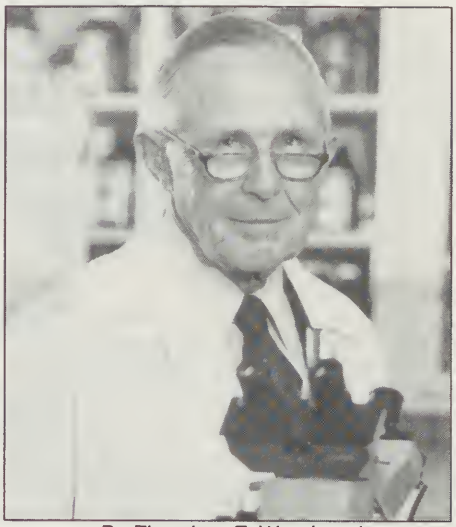
Lee H. Riley Jr., MD, professor of orthopedic surgery at The Johns Hopkins University School of Medicine and orthopedic surgeon-in-chief at The Johns Hopkins Hospital, has been appointed chairman of the medical board of The Johns Hopkins Hospital. He succeeds *Paul McHugh MD*, director of the department of psychiatry.



Dr. Riley came to Hopkins in 1957 as an intern in general surgery after graduating from the University of Oklahoma School of Medicine. He completed his orthopedic surgery residency at Hopkins in 1963, joined the faculty, and was promoted to professor in 1972. He has acted as a consultant to the Food and Drug Administration and also has been involved in US-Soviet exchanges. Since 1980 he has served as coordinator of a US-USSR collaborative program in arthritis. Riley is best known for his work on artificial hip and knee implants and replacements and for surgery of the cervical spine.

The medical board at Hopkins directs the way medical care is administered by the hospital staff. It advises the Board of Trustees on all matters pertaining to the medical staff, quality assurance and the appropriateness of patient care, the accreditation of the hospital and medical education and research programs.

■ ■ ■

William E. Signor MD has assumed the position of director of Outpatient Surgical Services at St. Agnes Hospital. Dr. Signor received his bachelor's degree in microbiology from the University of Maryland at College Park and his medical degree from the University of Maryland School of Medicine.

He served his internship and surgical residency at St. Agnes from 1965 to 1970. For two years thereafter he served as a US Air Force surgeon in Vietnam, holding the rank of Major. Dr. Signor has been a member of the St. Agnes attending staff since 1972.

Dr. Theodore E. Woodward

Theodore E. Woodward MD, Professor of Medicine Emeritus, University of Maryland School of Medicine, recently was elected to Senior membership in the Institute of Medicine of the National Academy of Sciences. Members are elected by the incumbent membership on the basis of professional achievement and of demonstrated interest, concern, and involvement with problems and critical issues that affect the health of the public.

Established in 1970 as a unit of the National Academy of Sciences (but with separate membership), the Institute is broadly based in the biomedical sciences and health professions as well as related aspects of the behavioral and social sciences, administration, law, the physical sciences, and engineering. It is concerned with the protection and advancement of the health professions and sciences, and the promotion of research and development pertinent to health. ■

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

In the Matter of
Merrill Berman MD
Before the
Maryland Board of
Physician Quality Assurance

Consent Order

On March 13, 1989 the State Board of Physician Quality Assurance (the "Board") charged Merrill Berman MD (the "Respondent") with violations of the Maryland Medical Practice Act (the "Act"). Specifically, the Board charged Applicant under Section 14-504(a)(3) and (a)(24) (1988 Cum. Supp.) of the Act which states:

> (a) Subject to the hearing provisions of Section 14-504 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee
> (3) Is guilty of immoral ... conduct in the practice of medicine;
> (24) Willfully submits false statements to collect fees for which services are not provided.

A settlement conference was held on May 3, 1989. As a result of the settlement conference, the parties have agreed to enter into this Consent Order.

Findings of Fact

1. At all times relevant to these charges, the Respondent was and is licensed to practice medicine in Maryland.
2. On December 23, 1983, Patient A sought psychiatric care from Respondent. Patient A alleged a sexual relationship occurred during the course of psychiatric care with the Respondent. Respondent insists and maintains that no such relationship existed.
3. In 1985, Blue Cross/Blue Shield of Maryland, Inc. ("BC/BS") conducted an investigation of respondent's billing practices after receiving information from the Respondent that he was unable to work for certain periods between May 1, 1984 through September 5, 1985 due to spinal surgery. Subsequently the BC/BS investigation revealed that Respondent's billing to BC/BS included 111 dates of service for 10 patients for a total of $4,683.50 for which Respondent's records did not coincide with dates on which the Respondent was available to render services. The investigation further revealed from the patients that services were rendered but not substantiated by office notes and records. One patient advised of being billed for two (2) missed appointments. Respondent agreed to permit BC/BS to withhold $4,683.50 from his account to cover the discrepancy.

Conclusions of Law

Based on the foregoing Findings of Fact, the Board finds:
1. Respondent violated Md. Health Occ. Code Ann. Section 14-504(a)(3) (1988 Cum. Supp.); and
2. Respondent violated Md. Health Occ. Code Ann. Section 14-504(a)(24) (1988 Cum. Supp.).

Order

Based on the foregoing Findings of Fact, it is this 11th day of October 1989,
ORDERED that Respondent, a physician licensed to practice medicine in Maryland is hereby formally SUSPENDED for three (3) years from the date hereof; and it is further
ORDERED that the SUSPENSION be immediately STAYED subject to the following conditions:
1. Respondent shall be subject to a peer review of his practice by a peer review committee designated by the Board in six (6) month intervals for a period of three (3) years beginning six (6) months from the date of this Order;
2. Respondent shall abide by his Impaired Physicians' Committee contract, a copy of which is attached hereto and incorporated herein as Exhibit A; and
3. Any failure by respondent to comply with this Order will result in an immediate VACATING of the STAY and reinstitution of formal proceeding by the Board.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby submit to the entry of the above Findings of Fact and Conclusions of Law and agree to be bound by the foregoing Order and its conditions and restrictions, consisting of six (6) pages.
1. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that I might have following any such hearing. By this consent, I waive all such rights.
2. I understand that if I fail to comply with the conditions enumerated above, then the Board may vacate the stay of the suspension and reinstitute formal proceedings after notice and an opportunity for a hearing.

3. I am entering into this Consent for the purpose of resolving the charges initiated by the Board against my license and neither admit nor deny any Finding of Fact contained in this document.

4. I am represented by E. Lynn Hoffman, Esq. and Arnold G. Foreman, Esq. and I have consulted with them before signing this Order. I sign this Order voluntarily, fully understanding its meaning.

MERRILL BERMAN MD

Maryland Board of
Physician Quality Assurance

Final Order

This case is before the Board of Physician Quality Assurance (the "Board") as a result of charges brought by the Board against the Respondent, Albert I. Chalom MD, issued January 11, 1989, for Violation of Conditions of the Consent Order of October 6, 1987 (the "Order") issued by the Commission on Medical Discipline (hereinafter "Commission"). The Order provided that Respondent's license was suspended, said suspension stayed subject to the Respondent's complying with certain conditions of probation.

Specifically, the Board charged the Respondent with violation of Condition 6 of the Order, which states as follows:

> That Respondent shall practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland.

The order provided that Respondent would have an opportunity for a hearing prior to the Commission removing the Stay or imposing a disciplinary sanction. A hearing commenced on February 6, 1989 before a Hearing Officer pursuant to Section 10-201 of the State Government Article.

The Hearing Officer issued a proposed decision on March 6, 1989. Respondent filed exceptions on March 27, 1989. A hearing on the exceptions was held before the Board on June 28, 1989. The following represents the final decision made by a majority vote of the full authorized membership of the Board considering this case.

Summary of Evidence

Attached to the Statement of Charges, and included into the Hearing File as Hearing Officer Exhibits were:

> Hearing Officer Exhibit A - A copy of the Findings of Fact, Conclusions of Law and Order dated October 6, 1987.
> Hearing Officer Exhibit B - A copy of the Mary 20, 1988 report of Dr. Tilley to the Chairman of the Peer Review Committee of the Baltimore City Medical Society.
> Hearing Officer Exhibit C - A copy of the July 27, 1988, report to the Physician Quality Assurance Board from the Baltimore City Medical Society.
> Hearing Officer Exhibit D - A copy of the report to the Board of Physician Quality Assurance from the Baltimore City Medical Society Peer Review Committee, dated December 16, 1988.

At the hearing, the State introduced the following exhibits which were accepted into the hearing record without objection by counsel for the Respondent:

> State Exhibit 1 - A list of patient files examined by the peer reviewers in this case correlated to their alphabet designation in the Statement of Charges.
> State Exhibit 2 - Patient file for Patient B.*
> State Exhibit 3 - Patient file for Patient C.
> State Exhibit 4 - Patient file for Patient J.
> State Exhibit 5 - Patient file for Patient N.
> State Exhibit 6 - Patient file for Patient I.
> State Exhibit 7 - Patient file for Patient A.
> State Exhibit 8 - Patient file for Patient G.
> State Exhibit 9 - Patient file for Patient M.
> State Exhibit 10 - Patient file for Patient L.
> State Exhibit 11 - Patient file for Patient F.
> State Exhibit 12 - Patient file for Patient E.
> State Exhibit 13 - Patient file for Patient H.
> State Exhibit 14 - Patient file for Patient P.
> State Exhibit 15 - Patient file for Patient D.
> State Exhibit 16 - a copy of the report to the Board of Physician Quality Assurance from the Baltimore City Medical Society Peer Review Committee, dated December 16, 1988.

Testifying for the State was David Posner DO, 12 West Chase Street, Baltimore, MD 21201, a Board Certified Family Practitioner, and a Diplomate of the Family Practice Board. Dr. Posner is also a member of the Baltimore City Medical Society Peer Review Committee, who, in addition to reviewing the Respondent's medical practice, has reviewed between 12 and 20 additional medical practices in his capacity as a member of PRC BCMS.

Respondent, represented by counsel, testified under oath on his own behalf, and through his counsel, introduced the following exhibits, which were accepted into the hearing record without objection from the State:

> Respondent Exhibit 1 - An April 19, 1988 memorandum from Peter M. Hartman MD to Edward J. Kowalewski MD regarding Respondent's participation in course of study with the Department of Family medicine at the University of Maryland School of Medicine.
> Respondent Exhibit 2 - The April 26, 1988 letter from Dr. Kowalewski to the Commission regarding the Respondent's participation in training at the University of Maryland School of Medicine.
> Respondent Exhibit 3 - The November 20, 1987, letter from counsel for Respondent to the Commission requesting that the information requiredby the remedial training program be sent to the University of Maryland in order that Respondent be enabled to begin his remedial training.

* The names of the patients have been coded to protect their identity. A list of patients has been filed with the Board.

Respondent Exhibit 4 - The March 21, 1988 letter from Med Chi to counsel for Respondent advising him that the latter's request for peer review of the respondent had been forwarded to the Baltimore City Medical Society.
Respondent Exhibit 5 - A copy of the August 25, 1988 letter from counsel for Respondent to the Board requesting a second peer review of Respondent's medical practice.
Respondent Exhibit 6 - A copy of the September 29, 1988 letter from counsel for Respondent to the Board advising them that the second peer review had not been performed.
Respondent Exhibit 7 - A copy of the November 15, 1988 letter from the Board to counsel for Respondent advising the latter of the Peer Review Committee's recommendations with regard to Respondent's practice of medicine.
Respondent Exhibit 8 - A copy of the June 6, 1988 letter form counsel for Respondent to the Commission requesting that Respondent's right to rescribe controlled dangerous substances be restored.
Respondent Exhibit 9 - A copy of the October 28, 1988 letter from counsel for Respondent to the Board requesting a response to his June 6, 1988 letter to the Commission.
Respondent Exhibit 10 - A copy of the May 20, 1988 report of Lawrence E. Tilley MD, to the Chairman of the Peer Review Committee of the Baltimore City Medical Society regarding the results of the review of Respondent's medical practice.
Respondent Exhibit 11 - A copy of the July 27, 1988 report to the Physician Quality Assurance Board from the Baltimore City Medical Society.

Findings of Fact

Based on a review of the testimony, exhibits, and the exception hearing by clear-and-convincing evidence, the Board finds that:

1. On October 6, 1987, the Commission suspended Respondent from the practice of medicine in the State of Maryland; the suspension was immediately STAYED; Respondent was placed on probation subject to certain terms and conditions as set forth in the Findings of Fact, Conclusions of Law, and Order. (*See* Hearing Officer Exhibit A attached to the Statement of Charges.)

2. Pursuant to the Order, Condition 3 required Respondent to have his practice reviewed quarterly by the appropriate Peer Review Committee of the Medical and Chirurgical Faculty during the period of the Order. (*See* Hearing Officer Exhibit A attached to the Statement of Charges.)

3. On May 13, 1988, the first quarterly review of Respondent's practice was conducted by Drs. Aldo-Pax-Guevara and Lawrence Tilley. (*See* Respondent Exhibit 10 and Hearing Officer Exhibit B attached to the Statement of Charges.)

The peer review substantiated that Respondent had no hospital privileges and that he relied heavily on referrals to Francis Scott Key and Franklin Square Hospitals. Respondent completed a tutorial at the University of Maryland's Family Practice Departdment, attended the core conference in family medicine, and prticipated in CME courses for credit since the date of the Order. Respondent also was unable to prescribe controlled substances as a result of the Order.

The May 13, 1988 review of Respondent's practice by Drs. Paz-Guevera and Tilley, was accomplished through a review of random charts selected by them. At this review. it was noted, "Newer charts show better organization and legibility of material." It was also found that Respondent extensively used medication for diagnoses of depression and anxiety. The review concluded, in part:

> [Respondent's] office practice has improved noticably (sic) but is still sub-standard. Three months of tutorials several hours per week cannot replace years of training in family practice.

Dr. Tilley also emphasized that Respondent needed to maintain a low threshold for referrals in serious, complicated, or unusual cases, and that he should not see children under the age of six (6).

4. On July 27, 1988, the Baltimore City Medical Society reported its findings to the Board. (*See* Respondent Exhibit 11 and Hearing Officer Exhibit C attached to the statement of charges.)

This report gave certain background information, including, in part:

> [Respondent's] remedial training program began on January 6, 1988... Peter M. Hartmann MD, who was [Respondent's] Course Director, wrote... noting that [Respondent's] general fund of medical knowledge was marginal and remained limited. His recommendations were that [Respondent] not see children under the age of six for any condition and that he continue to attend regularly scheduled continuing medical education programs of a least three hours each week....
> Dr. Kowalewski... [concurred] with Dr. Hartmann on [Respondent's] progress... and added that the Peer Review Committee should pay particular attention to [Respondent's} medical records, his dispensing of mood-altering drugs, evidence of continuing education, and his use of controlled substances in general. (State Exhibit 16 page 1)

The report indicated that the second quarterly review, performed on October 26, 1988, was accomplished by review of eighteen patient records which were selected and provided to the reviewers by Respondent (ten pediatric patients, four old patient records, and four new patient records). As a result of the document review by the Peer Reviewers, Respondent was invited to attend the December meeting of the Peer Review Committee to answer questions with regard to the records reviewed. Respondent and his attorney attended the meeting of the Peer Review Committee, and the following conclusions were reached by the Peer Review Committee as a result of the second review procedures, in part:

> From this committee's review, it appears that [Respondent] attempts to give only episodic care to his patients. However, even in providing only limited care, [Respondent's] practice is substandard. He frequently overlooks serious chronic problems or fails to investigate potential problems. He provides no follow-up care for patients even when such is directly indicated by his diagnosis. He does not know the indications, contraindications, or interactions for many of the medications he uses.
> More specifically, there are no adequate histories or physical

examinations in any of the charts.... Although it has been strongly recommended in the past that he not treat children under the age of six, he continues to see young children. Among the records [Respondent] submitted to the Committee were three patients who are six years old or younger.
When questioned about why he continued some patients on medications, his response was that another physician had given the prescription and he continued it.... He consistently fails to perform appropriate tests of examinations to evaluate his patients' conditions and/or progress, and during questioning he seldom seemed to know what tests or exams should be done or what the results would indicate.
While there was some minor improvement in the record keeping before and after he entered the program at the University of Maryland, the changes appear to be superficial at best....While he appears to try to use the SOAP format, he does not seem to understand what examinations should be performed at a given time nor what his objective finding would indicate. (State Exhibit 16 pages 2 and 3)

The recommendations of the Baltimore City Medical Society, as a result of the Peer Reviews conducted, were, in part:

As a result of this review, this committee believes that [Respondent] does not have the fund of medical knowledge which would allow him to practice competently. We believe his practice is far below the minimum standard which would be acceptable in this community and recommend that action be taken promptly to remove him from practice. (State Exhibit 16 page 3)

5. The standard of care practiced by Respondent in his practice of medicine is below that standard acceptable in the State of Maryland, as evidenced by the standard of care rendered to the following patients:

Patient A. The Board has alleged, in part:
Standard practice is for the family doctor to oversee and coordinate care. Respondent did not accept this responsibility apparently expecting the referral physician to manage the patient's complaint. Respondent provided no complete history or physical examination and no discernable treatment plan.

Respondent testified that he referred this 45-year-old patient to four different physicians: a cardiologist, two ophthalmologists, and a urologist. He stated that he received suggestions from the referrals and that he followed the suggestions in his course of treatment of the patient. He testified that HCTZ was prescribed, not for hypertension, but for carpel tunnel syndrome, which he diagnosed by swelling in the patient's hand. The Respondent explained that the patient was receiving Motrin for arthritis, and that he later prescribed Zantac due to the stomach distress she experienced from the Motrin. He added that his plan was for her to eventually stop or decrease the Motrin, but that until this could be accomplished, he treated the stomach distress with Zantac while decreasing the Motrin.

The peer reviewers, after a full discussion of all of the treatment the patient received from the Respondent, concluded, in part:

The patient presented with essentially the same physical findings on March 3 as in January, yet in March she was diagnosed with acute bronchitis. No temperature was taken on any visit to indicate that infection was present, yet an antibiotic was prescribed. There is nothing in the chart to indicate the [Respondent] counselled this patient about her weight (300+lbs) or smoking at any time even though there is a note on the visit of July 28th which indicates that the patient might have nicotine poisoning.
...When questioned further, he did not seem to know how the medications interact.
...standard of practice is for the family doctor to oversee and coordinate her care. [Respondent] does not seem to accept this responsibility for the patients, apparently expecting the referral physician to manage the patient's complaint. He provides no complete history or physical examination and no discernable treatment plan.

Dr. Posner testified that standard of care for this patient required that investigation be done to determine whether the cough with phlegm could be related to congestive heart failure in light of the fact that she suffered from angina. He suggested that a chest X-ray, cardiogram, and a TB test should have been performed. He also testified that the use of Lotrisome for a diagnosis of psoriasis was not within the standard of care. He noted that notwithstanding the complex history of this patient and the profusion of her symptoms, no temperatures were noted in the record, and that the record was also silent as to investigation of the urinary tract symptoms.

The standard of care with regard to this patient was breached in that inadequate investigation was performed to determine the cause of the persistent cough suffered by the patient and, the evaluation of the urinary complaint was inadequate. In addition, temperatures were not noted in the chart where the complaints required such an observation, and the Respondent failed to take adequate charge of this patient's treatment regime, which failure is inappropriate for her primary physician.

Patient B. It was alleged by the Board, in part:
It is substandard to treat a young male for cystitis when presented with the symptoms noted. The patient's complaints during the first visit warranted a much more thorough evaluation, at least a microscopic examination of the urine. Urinary infection is extremely uncommon in a young male. Its presence requires further evaluation of anatomical abnormalities in the urinary system.

Respondent testified, on direct examination, that after treating the twelve-year-old boy for cystitis with Amoxicillin, the patient returned on June 28, 1988, with no continuing urinary tract symptoms. He added that he did not culture the urine of the patient because he "knew" it would culture *E. coli*. He added that he prescribed Amoxicillin on the first visit because the patient complained of both a sore throat and the cystitis symptoms. He stated that Amoxicillin is a broad-spectrum antibiotic that he chose to treat both conditions. Respondent added that on the second visit, he changed the medication because there was no longer a sore throat, and therefore he elected to discon-

tinue the broad spectrum antibiotic in favor of Gantrasin to treat the cystitis.

Respondent, during cross-examination, testified that he did not examine the external genitalia of the patient due to the sensitive nature of such an examination for a twelve-year-old male.

The peer reviewers noted that the patient warranted a much more thorough examination on the first visit prior to initiation of treatment for cystitis. The peer reviewers and Dr. Posner, in his testimony, emphasized that cystitis is quite uncommon in a young male, and that, for this reason alone, a more thorough investigation of the matter was required.

With regard to the care rendered in this case, the standard of care was breached most significantly by failure to perform a more thorough examination of the patient, via both the external genitalia and a urinalysis, and the failure to effectuate a referral to a Urologist.

Patient C. It was alleged by the Board, in part:

> There is nothing in this chart approaching the type of history and physical examination that would be expected for a new patient presenting with diabetes mellitus with urinary frequency....Even if awaiting a record from a previous physician, a more complete physical examination and history should have been performed on the first visit....There is no indication that the patient was given a diabetic diet to follow. Nor does the chart note at the second visit anything about further follow-up, which is certainly substandard for a known diabetic.

Respondent testified that this patient, a diabetic, was under the primary care of another physician who treated the patient for diabetes. He stated that the patient came to him only for episodic care of urinary tract symptoms. Respondent stated that he prescribed Bactrim, initially, as a medication due to its potent effect on urinary tract infections. He stated that he changed the medication after two weeks to Macrodantin on the following bases: urinary tract infections in diabetics require a protracted period of treatment; Bactrim is a potent antibiotic that should be used only for a short term treatment; Macrodantin is a milder cleansing agent that is preferable for longer term use in a diabetic. Respondent testified that he did not palpate the patient's abdomen or examine his external genitalia because the history given by the patient strongly indicated a urinary tract infection, and, therefore, there was no need to proceed with the physical examination of the abdomen or genitalia, notwithstanding the occurrence of prostatitis in men of the patient's age (64 years).

Accepting that this patient uses the services of another physician for primary care, it was determined by the peer reviewers, nonetheless, to be below the standard of care to forego a more complete physical examination and history at the time of the first visit. The patient was a diabetic, and yet there was no indication in Respondent's records of the date of the onset of diabetes, how long the urinary problem has been present, and no indication of any abdominal examination.

Dr. Posner noted that urinary tract infections in diabetics are quite serious and that a culture of the urine should have been performed prior to prescribing antibiotic medication. He added that, certainly, prior to a change in the medication, there should have been a culture and sensitivity done.

The standard of care was breached in the treatment rendered to this patient by failure to obtain a more complete history of this diabetic patient, by failure to note that the patient had a primary physician, by failure to perform a more thorough physical examination, and by failure to culture the urine prior to initiation of treatment.

Patient D. It was alleged by the Board, in part:

> On three occasions, Respondent prescribed Motrin and Zantac when the patient complained of stomach upset. Respondent stated that another doctor prescribed the Motrin and he continued it, but there is no history in the Patient's chart. Respondent did not know that Motrin could be the cause of the stomach distress.
>
> Respondent did not know whether Cardizem, a drug he prescribed for the patient was a beta blocker or channel blocker.
>
> It is substandard not to conduct an initial history and physical of this patient.

This 71-year-old female patient was seen by the Respondent every two to four weeks from June 1988 to October 1988 for various symptoms. She was treated by Respondent for cystitis, bronchitis, depression, hypertension, angina pectoris, stomach spasm, and rheumatoid arthritis. He prescribed various medications for the diagnoses: Macrodantin (for cystitis), Zantac (for stomach distress), Nitro (for angina), clear liquid and BRATT diet (for gastrointestinal symptoms), Adafin (for depression), Cardizem (for hypertension), Amoxicillin (for acute bronchitis, and Lentax (for a recurrence of cystitis), plus other medications. Respondent testified that he assessed the level of the patient's depression through conversations with her in the office and by observation, and that he prescribed Adafin as an antidepressant. Counsel for Respondent referred to the Physician's Desk Reference to support that Adafin is not only an antianxiety medication, but is also an antidepressant.

The peer reviewers found considerable problems with the treatment rendered to the patient by the Respondent in this case. The major areas of concern expressed by them were: the lack of an adequate history and physical examination on a patient with the complex symptoms exhibited by her; and the failure to substantiate diagnoses of congestive heart failure, cystitis, depression, hypertension, and angina pectoris; and the Respondent's apparent lack of understanding of pharmacology. They summed up their concerns, in part:

> Clearly, these are not the actions of a physician who knows the dangers of prescribing multiple medications. [Respondent's] response to the committee's question as to why he prescribed many of the drugs he did was that other physicians had prescribed them and he just continued them,

but there is no indication that he contacted previous physicians. [Respondent] is treating whatever symptoms are presented with no underlying treatment plan and no evaluation of the patient's overall physical health (State Exhibit 16 page 17).

Dr. Posner testified that the Respondent breached the standard of care in his treatment of this patient by his lack of understanding of pharmacology. As examples he cited the use of very potent hypertension drugs in the case where the patient's chart noted only one incident of a blood pressure of 156/90. He added that the danger of quickly lowering a patient's blood pressure is the possibility of causing arrythmia in the patient. Dr. Posner stated that the Respondent's use of the drugs prescribed for hypertension may have had this unfortunate result. He also noted that a patient, whom Respondent had termed to be suffering from congestive heart failure, should have had a proper examination by cardiogram and chest X-Ray on October 3, 1988, when she appeared complaining of shortness of breath, soaking wet from perspiration. He stated that the lack of such investigation of these symptoms is a breach of the standard of care. He added that lack of chest x-ray, lack of cardiogram, and lack of investigation of the patient's complaints regarding difficulty in breathing on July 25, 1988 constituted a breach of the standard of care.

The standard of care for treatment of this patient was breached by the general lack of understanding of pharmacology by the Respondent, and his failure to adequately investigate the cause of the patient's complaints of difficulty in breathing. This patient had varied complaints, and the Respondent's approach to her treatment displayed a lack of understanding of pharmacology, and a lack of underlying treatment plan and lack of evaluation of her overall physical health.

Patient E. It was alleged by the Board, in part:
The terms atopic and fungal are mutually exclusive. Respondent was (sic) unable to explain how he made the diagnosis. Respondent did not perform a set prep exam which is standard practice.

Respondent's file indicates that this 30-year-old female patient presented to him on September 29, 1988 complaining of a rash on her back. The chart has a circular sketch on what is described as the forearm. Respondent described the rash as "ringworm." The chart, however, notes "dermatitis" as the diagnosis, and the prescription issued by Respondent was for Lotrisome. Respondent further described the skin irritation as "Atopic dermatitis (fungal in origin)." No culture was performed prior to diagnosis. The Respondent testified that he knew the skin rash was ringworm, and that he does not know why he wrote "atopic dermatitis (fungal in origin)" on the chart. He stated that he knew the difference between atopic dermatitis and ringworm.

The peer reviewers commented that Respondent did not appear to know the difference between the terms atopic and fungal. They were also critical of Respondent's failure to perform a culture prior to making a diagnosis of the skin rash.

Dr. Posner testified that the standard of care for the treatment of this patient was breached by the failure of the Respondent to differentiate between a fungal infection and dermatitis.

The standard of care for the treatment of this patient was breached by the failure of Respondent to utilize proper diagnostic procedures prior to prescribing medication for the skin rash, and by failure in his ability to differentiate between fungal infections and dermatitis.

Patient F. It was alleged by the Board, in part:
Accepted standards of medical practice dictate that a physician observing a child as feverish, dehydrated, sick, and sleepy should have taken her temperature. This child was seen four times for a sore throat, once with an enlarged tonsil, but no throat culture was obtained. The dermatitis was repeatedly diagnosed as "allergic," however, no consideration seems to have been given to discovering its possible cause. And, despite the presence of this rash, there was no follow-up or correlation with the previously diagnosed ringworm.

This ten-year-old patient was seen nine times by the Respondent in an eleven-month period. On four occasions, the complaints of the patient were related to sore throat or upper respiratory problems. No throat cultures were performed on any of those occasions. On four occasions, the patient was seen for gastrointestinal complaints. On one of these occasions, she was noted by the Respondent to be feverish, dehydrated, sick, and sleepy. On none of these visits did the Respondent perform an abdominal examination, and only once did the chart indicate that the child appeared to be dehydrated. On three occasions the patient was seen for skin rashes or irritations, and she was diagnosed by the Respondent as having allergic dermatitis and ringworm. On several of the visits, Respondent noted in the chart that the patient had a viral infection and prescribed only Rondec. Twice the Respondent prescribed antibiotics for either the cough or the sore throat. Antihistamines and Lotrisome were prescribed for the skin irritations.

The peer reviewers, in their criticism of the treatment rendered to the patient by the Respondent stated, in part:

Accepted standards of medical practice would dictate that a physician observing a child as feverish, dehydrated, sick and sleepy should have taken her temperature. This child was seen four times for a sore throat, once with an enlarged tonsil, but no throat culture was obtained. The dermatitis was repeatedly diagnosed as "allergic," however, no consideration seems to have been given to discovering its possible origin. And, despite the presence of this rash, there was no follow-up or correlation with the previously diagnosed ringworm (State Exhibit 16 page 11).

Dr. Posner testified that the standard of care for treatment of this patient was breached by lack of skin culture or microscopic examination of the skin rash to

determine its proper treatment, lack of throat culture during the course of treatment for a young patient treated four times over a six month period for sore throat, and by failure to note temperature on the chart. He also testified that the failure to perform an abdominal examination or further investigate the level of her dehydration when she presented with severe gastrointestinal symptoms as below the acceptable standard of care.

The standard of care for treatment of this patient was breached by failure to conduct proper diagnostic procedures with regard to the throat and, skin, and abdominal symptoms. The standard of care required that a throat culture be performed, that abdominal examination be performed, that hydration levels be noted, and that the skin rash be cultured prior to prescribing treatment.

Patient G. It was alleged by the Board, in part:
This child was in to see Respondent nine times in nine months for a series of coughs, colds, and flu-like symptoms. She received three courses of antibiotics in a five-month period for fever, sore throat, runny nose and cough without an appropriate culture. Respondent's notes of 1/11/88 indicate that he believes the presence of yellow phlegm means that an antibiotic should be prescribed which is an inappropriate reason to prescribe an antibiotic. This patient has a history of asthma, and Respondent did not know the difference between an asthma attack and bronchitis.

There were no abdominal examinations or hydration notes in the record, even when the child was seen for gastritis symptoms. When treating a patient with an eye irritation, an examination of the ears, nose, and throat is standard practice prior to determining a diagnosis.

Respondent testified that this eleven-year-old child had nine office visits in a period of ten months. She was seen for gastric complaints including vomiting and loose bowels, for eye irritation, and for sore throats, coughing, and running nose. Respondent, at various times prescribed antihistamines and antibiotics for the sore throat and coughing, Neosporin for the conjunctivitis, and Bratt diet for the stomach distress. At no time did he perform an abdominal examination or determine hydration levels in the patient, nor did he ever record a temperature or perform a culture for either the sore throat, cough or the conjunctivitis symptoms.

The peer reviewers stated the standard of care for treatment of this patient was breached by the lack of abdominal exams or hydration levels, the lack of cultures performed prior to courses of treatment with antibiotics, and the lack of a complete ENT examination prior to making a diagnosis of conjunctivitis.

Dr. Posner testified that the standard of care for treatment of this patient was breached in the totality of her treatment by the Respondent. He stated that the lack of abdominal examination and hydration levels for a pediatric patient with vomiting and diarrhea symptoms is not within the standard of care and is a dangerous practice. He added that the lack of recordation of temperatures in instances where the Respondent made a diagnosis of bronchial asthma and the lack of cultures when he prescribed antibiotics for treatment was not within the standard of care. Dr. Posner also opined that the frequent diagnosis of rhinitis should have resulted in a referral to an ENT specialist or allergist.

The standard of care was breached in the treatment of this patient by Respondent's failure to use proper diagnostic procedures prior to prescribing treatment with antibiotics, by failure to refer the patient to an ENT specialist after repeated visits for "rhinitis" and by failure to perform abdominal examinations and note hydration levels in a pediatric patient suffering from acute gastric distress.

Patient H. It was alleged by the Board, in part:
It is standard practice to measure red blood count when a patient complains of pain and blood loss for six weeks duration.

Respondent saw this patient for pain and bleeding during bowel movements. She was pregnant at the time of the visit, and she stated that she had been experiencing the symptoms for about six weeks. She stated that the pain and bleeding were severe, and that she would be left shaking from the symptoms. Respondent performed a pelvic examination, diagnosed internal hemorrhoids and prescribed Anusol HC.

The peer reviewers criticized the treatment rendered to the patient by the Respondent for his failure to measure her red blood count in view of her six-week history of blood loss and pain.

Dr. Posner testified that the standard of care for treatment of this patient was breached by Respondent's failure to measure the red blood count of the patient. He also stated that Respondent's diagnosis of internal hemorrhoids is inconsistent with the symptoms described in the chart. He stated that internal hemorrhoids are not enervated, and are therefore painless, and that external hemorrhoids are painful when they are enlarged. He also stated that an examination of the liver and spleen should have been done along with a blood count to determine whether the bleeding might be from somewhere else in the intestinal tract other than the rectum.

The standard of care for the treatment of this patient was breached by the failure of the Respondent to measure the read blood count and by his failure to more fully investigate the possible origin of the bleeding in this patient. It is also below the standard of care to diagnose internal hemorrhoids in a patient whose symptoms include pain during the bowel movement.

Patient I. It was alleged by the Board, in part:
He presented with the same symptoms almost monthly and was repeatedly diagnosed as having bronchitis or rhinitis and was treated with antibiotics. However, no cultures were taken, temperatures were recorded on only two for the ten visits, and only one ENT examination was conducted. No

history was obtained to rule out the possibility of asthma or an allergy problem.

This four-year-old patient was seen by Respondent nine times between May 28, 1987 and October 24, 1988. At virtually all of his visits to Respondent, the symptoms complained of were cough, congestion, and sneezing. Although the diagnoses recorded in the charts varied from rhinitis to bronchitis, there was no evidence or testimony that a throat culture was ever performed. There was also no referral to an allergist although the records indicate that the child did not run fevers and, for a period of more than 15 months, continued having symptoms compatible with allergy.

The peer reviewers commented that this child was treated with various antibiotics without the benefit of any cultures being performed. It was also noted that temperatures were recorded on only two of the visits, and no history was included in the charts which would rule out the possibility of asthma or allergy. The peer reviewers made a point of noting that Respondent "did not appear to realize that he should have investigated this possibility."

Dr. Posner testified that the standard of care for this patient required that at least one throat culture be performed and that a referral should have been made to an allergist. He stated that the history of URI such as that presented by this patient required a throat culture at some point during the treatment.

The standard of care is breached in the treatment of this patient by the lack of referral to an allergist and by lack of performing any throat cultures when the record indicates the use of various antibiotics.

Patient J. It was alleged by the Board, in part:
When hypertension was diagnosed on 7/28/88, the patient had a blood pressure of 146/90. Over almost all of his visits (on 1/7, 2/5, 4/14, 5/9, 6/10, 8/22, 10/13, and 10/27), his weight and blood pressure were relatively the same as on 7/28/88. Why Respondent suddenly diagnosed hypertension is not clear, nor is it clear how he intended to treat the patient for hypertension.

Respondent testified that his patient, on the discovery of blood in his urine and diagnosis of painless hematuria, was referred for cystoscopy. He stated that on subsequent visits by this patient, he referred the patient to Dr. Breschi at Franklin Square Hospital, and that, eventually, a cystoscopy was performed. Respondent testified that the patient reported to him that he suffered from frequent urination in the night, and that this was the basis for the diagnosis of prostate enlargement. Respondent stated that he did not want to examine the patient's prostate due to the sensitive nature of such an examination, and that frequent nocturnal urination is generally caused by enlarged prostate in men of the age of the patient (73 years). He added that on the basis of the history, there was no need to perform an abdominal examination.

The peer reviewers noted the lack of a history for this patient who suffered from diabetes and bronchial asthma. They noted concern for the lack of an aggressive investigation on the first visit of the urological complaints by the diabetic patient. It was also noted with concern that an apparent diagnosis was made, on July 28, 1988, of hypertension, when the patient's blood pressure had been fairly consistent for the prior 18 months. The peer reviewers noted that the record is silent as to any serious attempt to address the patient's diabetic condition notwithstanding comments by the patient referring to "cheating" on his diet noted in the record. With regard to the patient's lung condition, asthma was noted in the record on July 28, 1988, but no mention of this condition was made again until the patient complained of shortness of breath on October 13, 1988.

Dr. Posner testified that the standard of care in a diabetic of this age requires that an abdominal examination be conducted to determine if there were a urinary obstruction. He added that a digital examination of the prostate would be required to make a diagnosis of prostate enlargement. Dr. Posner added that the lack of inclusion of a history of asthma in the first visit record is below the standard of care, and that laboratory blood work should have been done prior to prescribing medication for hypertension. Dr. Posner emphasized that the standard of care for a patient such as this requires that a glycolate hemoglobin and fasting blood sugar test be done.

The standard of care was not met with regard to treatment for this patient due to the lack of a complete history of the diabetes, lack of adequate physical examination for diagnosing the patient's problems, lack of adequate laboratory testing prior to administration of medications, and the lack of documentation or support for the diagnosis and treatment of hypertension in the patient.

Patient L. It was alleged by the Board, in part:
It is substandard eare to attempt to evaluate a patient presenting with gastrointestinal complaints without performing an abdominal examination or to check hydration. It is also substandard to fail to take and record temperatures and to make a diagnosis of upper respiratory infection without performing an ENT examination.

Respondent testified that he performed an ENT examination of this ten-year-old patient when she presented with fever and flu symptoms. He directed attention to the Chart for February 8, 1988, wherein he drew a picture of the enlarged tonsils and noted "but no erythema." He added that he did not feel that the child was very sick, and therefore he did not feel it was necessary to measure her hydration level. He also did not perform an abdominal examination although the patient presented with loose bowels, stomachache, and vomiting. He prescribed Erythromycin at this visit. Respondent also testified that he prescribed Ampicillin for the patient on September 9, 1988, as a precautionary measure to prevent infection after removal of stitches. Respondent stated when this patient would

present with gastrointestinal symptoms, he would pinch the skin on her hand to determine the dehydration level, and that he never noted a hydration problem in this child.

The peer reviewers commented that it was substandard care to attempt to evaluate the patient's gastrointestinal complaints without performing an abdominal examination and without noting the patient's hydration level. They also stated that it was substandard to fail to record the patient's temperature when making a diagnosis of upper respiratory infection. The peer reviewers commented that the standard of care in the diagnosis of allergic reaction made for the skin rash symptoms on September 9, 1988, required follow-up to determine the cause of the allergic reaction.

Dr. Posner testified that the standard of care for the treatment of this patient was breached by failure to perform an abdominal examination and note hydration levels when the patient presented with gastrointestinal complaints. He added that failure to note the temperature of the patient was also a breach of the standard of care.

The standard of care for the treatment of this patient was breached by Respondent's failure to perform an abdominal examination and failure to note her hydration levels.

Patient M. It was alleged by the Board, in part:
It is substandard to attempt to diagnose gastrointestinal problems without the benefit of an abdominal examination. It is also inappropriate to try and treat such problems without investigating the patient's hydration. It is also inappropriate to diagnose ringworm without testing.

This eleven-year-old patient was seen by Respondent of two occasions for symptoms of vomiting and loose bowels and upper respiratory symptoms, and twice for rashes on the leg. Respondent, on a visit when the patient appeared for elevated temperature, vomiting and loose bowels, prescribed Ampicillin for acute bronchitis. At that time her performed no abdominal examination and did not note hydration levels in the chart. On the occasion when the patient complained of a rash on the leg, Respondent, without performing a culture of the rash, diagnosed ringworm, contact dermatitis, and infectious dermatitis, and her prescribed Lotrisome. When the patient returned one week later again complaining of the leg rash, which had spread, Respondent, again without the benefit of a culture, diagnosed contact dermatitis and infectious dermatitis and prescribed Amoxicillin. He testified that the ringworm had been scratched by the patient and, in order to prevent infection of the area, he prescribed the antibiotic on the second visit.

The peer reviewers observed that it was substandard to make a diagnosis of gastrointestinal problems without the benefit of an abdominal examination, to treat abdominal symptoms without investigating the child's hydration level, and to make a diagnosis of ringworm without performing a culture.

Dr. Posner testified that the standard of care was breached throughout the course of treatment of this patient by failure to perform an abdominal examination of this patient or note the hydration level of the patient, and to diagnose ringworm without the benefit of a culture. He added that to diagnose ringworm and dermatitis is outside the standard of care. He explained that ringworm and dermatitis would not coexist, and that the former would not, in the period of one week, develop into the latter. He stated that although a change in diagnosis does not amount to a breach of the standard of care, the breach occurs due to the lack of the documentation regarding the diagnosis itself. He illustrated his point by noting that Respondent's records lack any indication of abdominal examinations, levels of hydration, or cultures performed.

The standard of care was breached in the treatment of this patient by the lack of adequate abdominal examination and lack of notation of hydration level. The standard of care with regard to the diagnosis and treatment of the skin rash on the patient's leg also was breached due to the lack of a culture performed prior to making a diagnosis, and due to the lack of documentation of the contradictory diagnoses of ringworm and dermatitis with regard to the same symptoms.

Patient N. It was alleged by the Board, in part:
A temperature of 98.4° is not a fever which would indicate the need for an antibiotic. There is no basis for a diagnosis of bronchitis on 5/10/88 when the record states that the chest was clear. This child was seen a total of four times for a sore throat, but no throat culture was done which would be a routine standard of care in treating this type of patient.

Respondent testified that this six-year-old boy, who was treated on four occasions for symptoms including sore throat, coughing and running nose, did not require a throat culture at any time. He stated that the child's mother would bring the child to the office "whenever he sneezed," and that he was sure that the illness was viral. He stated that there was no evidence of erythema or exudate noted in any of the visits, and that this would indicate that a negative culture would result. The Respondent added that on the third visit, when the chart noted that the child had a temperature of 98.4°, he did prescribe an antibiotic because he believed that there was a bacterial infection present, but he admitted that he did not perform a culture to determine the type of bacteria present.

The peer reviewers determined that a temperature of 98.4° and finding of a "clear chest" are indicative of neither a diagnosis of bronchitis nor the need for an antibiotic. They noted their concern that this child was seen four times for a sore throat in a seven-month period, and yet there was no throat culture performed.

Dr. Posner testified that the standard of care for a child presenting to a physician with the symptoms noted in the chart would require the notation of a

temperature in the chart, and a throat culture prior to prescription for antibiotics.

The standard of care was breached in the treatment of this patient by the lack of noting temperatures in the chart of a patient who presents with the symptoms indicated in this record and by the lack of a throat culture prior to the administration of an antibiotic. The standard of care is also found to have been breached as there appears to be no documentation, nor was there any testimony by Respondent, to support the diagnosis of bronchitis on May 10, 1988.

Patient P. It was alleged by the Board, in part:

No pelvic or breast examinations were made on this patient during any of the visits, nor was a mammography ever suggested, as would be standard for this type of patient. When asked why estrogen therapy was given without progesterone, Respondent had no explanation. Respondent was not aware of the potential risk to the patient of administering estrogen without progesterone, nor was he aware that he should examine the patient for the possibility of breast or pelvic cancer. Respondent also was not aware that treatment of osteoporosis with estrogen is presently considered ineffective if not administered within the first seven years post menopause. There is no notation in the chart to indicate the date of the onset of menopause. This is unacceptable treatment of this patient for any physician, but particularly for a gynecologist.

From August, 1987 through November, 1988, this patient was treated by Respondent for "osteoporosis and menopausal syndrome." Respondent prescribed Premarin and a calcium supplement for the patient. During the term of treatment, the chart notes that the patient had a continuing complaint regarding neck pain for which she took Advil, and that she was hospitalized in September 1988 for a five-day period as a result of a fall. The record does not indicate that any pelvic examinations were conducted, nor any mammogram, nor any diagnostic procedures that would have led to the original diagnosis of osteoporosis. Also, there was no prescription for progesterone to use in opposition to the Premarin therapy.

The peer reviewers criticized the lack of any evidence in the chart that would indicate the basis of the initial diagnosis of osteoporosis in August 1987. They indicated that January 1988 is the first mention of scoliosis, and that it was in March 1988 that the chart indicated that the curvature of the spine was severe. The peer reviewers were extremely critical of the patient's treatment with Premarin without any pelvic or breast examination or any mammography. They expressed great concern that the patient was treated with estrogen therapy without administering progesterone, and that the Respondent did not appear to realize the danger of such therapy. They also expressed concern that Respondent did not seem to be aware that the patient should have been examined for the possibility of breast or pelvic cancer during her treatment with estrogen. They also noted that the onset of menopause is not noted in the chart, and that estrogen therapy for osteoporosis has been found to be ineffective unless begun within seven years of the onset of menopause. They were extremely critical of this patient's treatment due to the fact that the Respondent's prior training was in the field of gynecology.

The peer reviewers also noted that it was substandard treatment for the Respondent to limit his approach to the high cholesterol level of the patient by merely counseling her to limit the number of eggs eaten per week, eliminate butter, and to eat more fish. They noted that the record should have included follow-up studies of the cholesterol levels in the patient's blood. There was also criticism of the lack of any effort made to obtain the records from the hospital in which the patient was hospitalized in September 1988.

Dr. Posner testified that the standard of care for the treatment of this patient was breached by the lack of breast examination, mammography, pelvic examination, and administration of progesterone to a patient diagnosed with osteoporosis and treated with estrogen. He stated that periodic examinations of the pelvis and breasts, including periodic mammography are required when estrogen therapy is administered. He added that it is not within the standard of care to use unopposed estrogen therapy. He stated that the standard of care is to cycle progesterone with estrogen therapy. Dr. Posner added that the lack of history as to the onset of menopause is also below the standard of care in the treatment of a patient diagnosed with osteoporosis.

The standard of care in the treatment of this patient is breached due to the improper use of estrogen therapy for this patient: lack of periodic pelvic and breast examination, lack of periodic mammography, lack of sufficient history information in the chart noting onset of menopause and number of pregnancies or children, and the use of unopposed estrogen therapy in the treatment of osteoporosis.

6. The cases reviewed were selected for review by the Respondent, and, after, review by two peer reviewers, the Baltimore City Medical Society Peer Review Committee, and Dr. Posner, there was not one patient whose overall care was within the acceptable standard in the community.

Board's Response to Respondent's Exceptions Respondent did not except to any particular finding of fact made by the Hearing Officer or to any conclusion of law. Therefore, the Board will address Respondent's exceptions in general, which is compatible with the manner in which Respondent made same.

Respondent's Exception #1

THAT the Hearing Officer failed to consider fully the fact that all the other demands set forth in the Consent Order entered into by and between Respondent and the Commission on Medical Discipline on October 6, 1987, were fully complied with by Respondent.

Board's Response to Respondent's Exception #1 It is irrelevant, as to the particular charged violation, that Respondent complied with the other conditions of probation. Respondent's compliance with conditions of probation 1 through 5 was not an issue. Indeed, the most important condition of probation was the

provision with which Respondent was charged. The Board rejects this exception.

Respondent's Exception #2

THAT the Hearing Officer failed to consider the fact that said compliance was at the behest and insistence of Respondent, as evidenced by Respondent's Exhibits 3, 4, 5, and 6.

Board's Response to Respondent's Exception #2 The Board incorporates its response to Respondent's exception #1. Again, the issue is whether Respondent complied with condition 6 of the Order.

Respondent's Exception #3

THAT the Hearing Officer failed to give sufficient weight to the fact that only through improvement, over time, would it be possible for Respondent to comply with Condition 6 of the Consent Order which mandates as follows: That Respondent shall practice full in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland.

Board's Response to Respondent's Exception #3 The Findings of Fact indicate that Respondent was given ample time to improve his practice to be in accordance with those standards expected of a competent practitioner in Maryland. The stay of Respondent's license was effective October 6, 1987. Subsequent peer reviews were conducted after Respondent had remedial training. These reviews indicated that Respondent's practice was substandard and his care of patients evidenced incompetence. Respondent was given one bite of the apple in the Order of October 6, 1987. Respondent does not deserve another. The Board rejects this exception.

Respondent's Exception #4

THAT the Hearing Officer failed to give proper consideration to the fact that a three (3) year probationary period was prescribed in the Consent Order in order to afford Respondent the requisite time to improve his practice.

Board's Response to Respondent's Exception #4 There is nothing in the October 6, 1987 Order to justify Respondent's bold assertion. The Respondent freely entered into this Order, a Consent Order. Respondent's counsel negotiated a resolution of the charges against Respondent, which insured to Respondent's benefit. Respondent was allowed to continue to practice and given an opportunity to comply with the applicable standards for the practice of medicine in Maryland. Even after the first peer review, which indicated that the remedial training had not improved Respondent's competence, Respondent was given the benefit of another review before the full Committee. Respondent's attorney opened a door for Respondent. Respondent has closed that door himself. The Board rejects this exception.

Respondent's Exception #5

THAT the Hearing Officer failed to consider fully the fact that the quality of Respondent's practice of medicine had improved significantly after his period of remedial training, as evidenced by Respondent's Exhibits 1, 2, and 10.

Board's Response to Respondent's Exception #5 The Hearing Officer weighed the evidence presented by Respondent against the evidence presented by the State and found facts to indicate that Respondent was not in compliance with the standards of practice of medicine in Maryland. Respondent's improvement was not at issue. Respondent's competence and compliance with the standards of practice in Maryland was at issue. The Board rejects this exception.

Respondent's Exception #6

THAT the Hearing Officer's recommendation that Respondent's license to practice medicine be revoked is incompatible with the Hearing Officer's own recommendation that Respondent should be encouraged to "obtain sufficient medical education and training to enable him once again be considered for licensing by the Board."

Board's Response to Respondent's Exception #6 The Board's present Order takes into account this exception. Respondent is given an opportunity to obtain sufficient medical education and training.

Respondent's Exception #7

THAT the Hearing Officer failed to give any consideration whatsoever to the State's own witness, Dr. David Posner, testimony that Respondent, through his practice, had not caused any patient to die, had not caused any harm to any patient, and had helped patients.

Board's Response to Respondent's Exception #7 The fact that there is no evidence that Respondent had not caused any patient to die, had not caused any harm to any patient, and had helped patients is not relevant to the charge against Respondent. The Board is mystified why Respondent believes that such as argument has merit. Such an argument leads to the absurd conclusion that the Board should wait until there is a damaging result from incompetent practice. The Board's mandate is to prevent harm, not to wait until it occurs.

Respondent's Exception #8

THAT the Hearing Officer failed to give any weight whatsoever to the intimidating circumstances of the second peer review of Respondent's practice in interpreting the results of that review, even though the State's witness volunteered, on his own, that the circumstances of that review were intimidating and unfair.

Board's Response to Respondent's Exception #8 At the hearing before the Hearing Officer, the State's expert witness testified as to the care given by Respondent to 14 patients. These patients charts were introduced. Respondent had ample opportunity to cross-examine the State's expert and to present expert testimony of his own. The Hearing Officer's findings that respondent was practicing substandard medicine was supported by this testimony. Regardless of what occurred at the full Committee review, Respondent had an opportunity to testify in an atmosphere that was not intimidating or unfair. The Board bases its decision the evidence introduced before the Hearing Officer and places great weight in the testimony of the State's expert. The Board rejects this exception.

Respondent's Exception #9

THAT a number of the Hearing Officer's conclusions with regard to the quality of Respondent's practice with regard to the care rendered particular patients were based on faulty interpretation of the State's witness' testimony with regard to medical facts.

Board's Response to Respondent's Exception #9 The Board is unable to respond to this unspecific exception does not set forth any details or transcript references.

Therefore, the Board rejects this exception noting that the State's expert testified as to the care rendered to each patient and explained carefully how Respondent had breached the standard of care.

Respondent's Exception #10

THAT the Hearing Officer failed to consider Respondent's twenty one (21) years of dedicated service to the people of Maryland, particularly the poor or near poor.

Board's Response to Respondent's Exception #10 The Hearing Officer's charge was to determine whether the charge against Respondent is correct. This exception has no bearing on whether Respondent violated the terms of probation of the October 1987 Order. Rather, this exception addresses the sanction that should be imposed. By giving Respondent an opportunity to be retrained and to reapply to the Board after any retraining, the Board has taken into account this exception. The Board further notes that attempting to make "the poor" or "near poor" a separate class and therefore medical treatment of this class deserving of special consideration insidious.

Respondent's Exception #11

THAT the Hearing Officer failed to consider less onerous alternatives than revocation of Respondent's license as viable means of protecting the public interest.

Board's Response to Respondent's Exception #11 There is clearly no way to protect the public from Respondent's substandard practice of medicine except to remove him from the practice. Respondent cannot be supervised every minute or left on his own. The testimony indicates Respondent does not practice competently in accordance with the standards expected of a competent practitioner of medicine in the State of Maryland. This exception is rejected.

Conclusion of Law

Based on the foregoing Findings of Fact, the Board concludes as a matter of law that:

The Respondent violated Condition 6 of his probation as provided in the Order of October 6, 1987, wherein he was required to "practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland."

Order

Based on the foregoing Findings of Fact and Conclusions of Law, pursuant to Health Occupations Article, it is this 23rd day of October 1989

ORDERED that the stay on the suspension of Respondent's license imposed under the Consent Order of October 6, 1987 be LIFTED; and be it further

ORDERED that Respondent's license is SUSPENDED until such time as Respondent:

1. Successfully completes a retraining program approved *a priori* by the Board;
2. Demonstrates to the Board that Respondent is competent to practice medicine as an obstetrician/gynecologist; and
3. Agrees to comply with any reasonable condition or limitation placed on Respondent's practice in order to protect the public health, safety, or welfare in the event the Board decides to stay the suspension of Respondent's license or reinstatement of his license; and be it further

ORDERED that this is a final order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

■ ■ ■

In the Matter of
Samuel W. Chang MD
Before the
Maryland Board of
Physician Quality Assurance

Modification of Findings of Fact
Conclusions of Law, and Order

In light of an Agreement in the above-captioned matter executed this day between the Board of Physician Quality Assurance (the "Board") by its Chairman, Israel H. Weiner MD, and Samuel W. Chang MD, who is represented by able counsel, entitled "Agreement to Modify Final Order In Lieu of Appeal," which Agreement is attached to and referenced herein, the Board hereby MODIFIES the Findings of Fact, Conclusions of Law, and Order issued on or about June 21, 1988 by the former Commission on Medical Discipline, to which this Board is the successor agency, so that at page 8, beginning on the third typewritten line, the language shown in brackets below shall be deleted, and the language underlined below shall be inserted:

ORDERED that the license or Respondent, Samuel W. Chang MD, an individual licensed to practice medicine in the State of Maryland, is hereby SUSPENDED for a period of five (5) years from June 21, 1988, which shall be deemed the date of this Order, and be it further

ORDERED that the board will entertain a Motion to Stay any part of the final thirty-nine (39) months of the foregoing license suspension provided that during the six-month period following the execution and service of this Modification, during which Respondent's license to practice medicine shall be completely suspended, that Respondent presents adequate proof of successful compliance with the following conditions:

In all other respects, the forementioned Findings of Fact, Conclusions of Law and Order, together with the conditions therein, shall remain unchanged and will this date be given full effect, except as modified herein.

It is so ordered.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Agreement To Modify Final Order in Lieu of Appeal

The undersigned parties, being (1) the Board of Physician Quality Assurance (the "Board") by its Chairman, Israel H. Weiner MD, and (2) Samuel W. Chang MD, who is represented by able counsel, Alexander Stark, Esquire, hereby agree as follows:

1. The Board shall modify its proposed order dated June 21, 1988, which was affirmed by the Board's Memorandum Decision, following exceptions, of May 24, 1989, to state that the five-year term of the Order will have commenced on June 21, 1988, but that the Board will not entertain a Motion to Stay the remainder of the Order until six months from the date of this Agreement. The Board will execute this day a Modification of the Findings of Fact, Conclusions of Law and Order in *In re Samuel Chang MD*, which effectuates its obligations under this Agreement. A copy of the Modification is attached hereto and is incorporated by reference as if set forth herein. By executing this Agreement, both parties agree to the terms of the Modification.

2. Samuel W. Chang MD, in consideration of the Board's execution of this Agreement and the attached Modification, agrees not to file any appeal from the board's final order, as affirmed and modified. Dr. Chang further agrees not to file any claim, demand, or other cause of action of any kind whatsoever against the Board, the former Commission on Medical Discipline, the State of Maryland or any of its agencies or Departments, or any agent or individual employed by or serving on any of the foregoing entities, arising out of the aforesaid Board Order, as affirmed and modified, or the facts and circumstances that gave rise to the Order.

The parties affirm that this Agreement, and the attached Modification, is the final and entire agreement between them concerning the disposition of the subject disciplinary proceeding.

SAMUEL W. CHANG MD

ALEXANDER STARK, Esquire
Counsel to Dr. Chang

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

HARRY J. MATZ
Counsel to the Board

In Re: Samuel Chang MD Before the Maryland Commission on Medical Discipline

Findings of Fact, Conclusions of Law, and Order

Based on information coming to its attention, the Commission on Medical Discipline of Maryland (the "Commission") conducted an investigation and subsequently determined to charge Samuel Chang MD ("Respondent") with violation of the Maryland Medical Practice Act (the "Act"), Md. Health Occupations Article, §14-101 et seq. code Ann. Specifically, the Commission charged Respondent with violating Health-Occupations Article, §14-504(6) and §14-504(22). Pursuant tot he latter charge, subsidiary violations of §14-504(3), (12), and (25) were also alleged. Specifically, the Commission charged that:

> Subject to the hearing provisions of Section 14-505 of the Maryland Medical Practice Act, ... the Commission on Medical Discipline ... on an affirmative vote of a majority of its full authorized membership may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if a licensee:
>
> Is ... convicted ... by a court of any state or country ... for an act that would be grounds for disciplinary action under this section. §14-504(22). Grounds under this section would be:
>
> Is guilty of immoral conduct in the practice of medicine; §14-504(3)
>
> Willfully makes or files a false report or record in the practice of medicine; §14-504(12)
>
> Willfully submits false statements to collect fees for which services are not provided; §14-504(25)
>
> Is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; §14-504(6).

Respondent was notified of the charges by letter dated December 1, 1987.

A prehearing conference was scheduled and conducted on January 14, 1988 during the course of which Respondent was represented by his counsel, Alexander Stark, Esquire, who also represented Respondent during the course of the criminal proceedings concluded prior to the initiation of the present action.

On February 25, 1988, a hearing was conducted in accordance with the Medical Practice Act and the Administrative Procedure Act. Commissioner Ronald Taylor MD conducted this evidentiary hearing in accordance with the provisions of COMAR 10.31.01.04.

Prior to the hearing, the administrative prosecutor filed a motion *in limine* seeking an order precluding Respondent from introducing into evidence any testimony and/or documents that would negate or explain his Medicaid fraud guilty plea. Respondent filed a response in opposition to this motion. This matter was discussed preliminarily during the February 25,

1988 evidentiary hearing. After hearing argument with respect to this motion, the Hearing Officer deferred making any ruling with respect to the motion at the initiation of the hearing.

Findings of Fact

In accordance with the provisions of Md. State Government Code Ann. §10-212, the Commission has reviewed the evidentiary record in this proceeding including all transcripts, exhibits, motions, and other documentary evidence. On the basis of the entire record and its collective experience, technical competence, and specialized knowledge in the practice of medicine, the Commission finds:

1. That the factual matters set forth in the foregoing section entitled "Procedural History" are found by the Commission as facts and are hereby incorporated into these Findings of Fact as if fully set forth herein.

2. That Respondent is a physician licensed and practicing in Maryland both currently and at all time material to the allegations relating to this matter.

3. That Respondent has maintained a private practice of medicine in Poolsville, Maryland since at least 1980.

4. That Respondent graduated from medical school in Korea in 1959. He subsequently completed an internship with the United States Army. Subsequently, he completed additional training in general surgery at Howard University and Rogers Memorial Hospital.

5. That on October 28, 1987, Respondent pled guilty pursuant to Maryland Rule 4-243 to a Criminal Information filed in the criminal proceeding captioned *State of Maryland v. Samuel W. Chang*, Circuit Court of Baltimore City, Criminal No. 28730125. Respondent pled guilty to one count of violating Article 27, §230C and §230D(a). Because the value of the money, services or goods involved in this criminal proceeding exceeded $500, this Medicaid fraud conviction constituted a felony pursuant to Article 27, §230D(a).

6. The charges to which Respondent pled guilty were based on his submitting fraudulent invoices and obtaining reimbursement from the Maryland Medical Assistance Program ("Medicaid"). In support of the plea agreement, the State of Maryland submitted a Statement of Facts indicating that in October of 1986 the Medicaid Fraud control Unit of the Office of the Attorney General initiated an investigation of Respondent based on suspicious billing patterns. Utilizing a Medical Assistance Program computer analysis, it was determined that Respondent's billing for office visits per patient, diagnostic lab procedures per patient, and laboratory procedures per patient greatly exceeded the average of physicians with similar medical practices. The Grand Jury of Baltimore City issued a subpoena duces tecum to Respondent on December 22, 1986 seeking patient charts and records for 41 named patients. After obtaining several extensions and filing an unsuccessful motion to quash the subpoena, Respondent surrendered these patient charts and files to the Grand Jury. State investigators were able to determine that several patient charts had been altered in response to the subpoena by comparing the records submitted to photocopies of charts previously submitted by Respondent to the Medical Assistance Program. In addition, the State's investigation established that Respondent altered and fabricated results from independent laboratories, whose services were utilized for patient diagnosis. In addition, interviews of Respondent's patients revealed that a majority of patients interviewed had not been seen by Respondent for symptoms indicated on his patient charts. The Statement of Facts further noted that Respondent submitted Medicaid billings for "extended" office visits that did not correspond to the statements of patients interviewed by the Office of the Attorney General. This fraudulent office billing practice resulted in Respondent overcharging the State for office visits in the amount of $6,056. The Statement of Facts further disclosed that Respondent did not perform diagnostic laboratory procedures in accordance with the billing submitted to the Medicaid Program. Laboratory records submitted by Respondent to the Grand Jury were compared to records independently maintained by the diagnostic laboratory. A comparison of these documents revealed that alterations and fabrications were made by Respondent. The State concluded in its Statement of Facts that Respondent fraudulently billed Medicaid $6,457.65 for laboratory services he never performed. The total payments obtained by Respondent through these fraudulent billing practices totaled $12,513.65. In accordance with Md. Health-General Article, code Ann., §15-123(b), the State sought treble damages in the amount of $37,540.95. The plea agreement jointly submitted by the State and Respondent in the criminal proceeding contains a recommendation by the State that the Respondent be sentenced to two months incarceration. Respondent sought a sentence of probation before judgment. The parties further agreed that Respondent would be sentenced to make restitution to the State of Maryland in the amount of $37,540.95, which was to be repaid by Respondent during a five-year period of unsupervised probation.

The State waived its right to prosecute Respondent for a charge of Obstruction of Justice resulting from his actions occurring during the course of the criminal investigation.

7. As a result of the plea agreement, State's Exhibit No. 4, the Statement of Facts, State's Exhibit No. 5, and the representations made by the State and Respondent during the sentencing hearing on October 28, 1987, State's Exhibit No. 7, Respondent was found guilty of the charges set forth above. The Circuit Court for Baltimore City imposed a judgment of 60 days suspended incarceration, five years of unsupervised probation and restitution in the amount of $37,540.95. Respondent subsequently filed a petition for modifica-

tion or reduction of sentence, which was denied by the Court except to the extent that restitution was reduced by the amount of $72.75 resulting in a final restitution award of $37,468.20. State's Exhibit No. 6.

8. During the course of the evidentiary hearing conducted by Commissioner Ronald Taylor on February 25, 1988, Respondent presented several letters of recommendation and the testimony of two patients in addition to testifying on his own behalf. During the course of this testimony, it was evident to Commissioner Taylor that Respondent had an inadequate command of the English language. The transcript of these proceedings further illustrates the nature of these inadequacies, which are of such a nature so as to raise serious questions as to Respondent's ability to effectively communicate with his patients and otherwise to perform such written and oral tasks as are necessary to practice medicine competently.

Conclusions of Law

Based on the foregoing Findings of Fact, the Commission on Medical Discipline, by the unanimous vote of a quorum of its members, concludes as a matter of law that Respondent violated §14-504(6) and §14-504(22) of the Maryland Medical Practice Act, Health-Occupations Article, Annotated Code of Maryland, and finds Respondent GUILTY of those charges. In making the findings with respect to §14-504(22), the Commission has determined that the Findings of Fact clearly contain ample grounds for sustaining the ancillary charges of §14-504(3), (12) and (25) so as to thereby sustain the broader charge of Respondent's violating §14-504(22).

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 21st day of June 1988, by the unanimous vote of a quorum of the members of the Commission on Medical Discipline,

ORDERED that the license of Respondent, Samuel Chang MD, and individual licensed to practice medicine in the State of Maryland, is hereby SUSPENDED for a period of five (5) years from the date of the execution of this Order; and be it further

ORDERED that the Commission will entertain a Motion to Stay the final fifty-four (54) months of the foregoing license suspension provided that during the six-month period during which Respondent's license to practice medicine is suspended, that Respondent presents adequate proof of successful compliance with the following conditions:

1. That Respondent shall continue to meet any conditions imposed by the Circuit Court for Baltimore City in the disposition of the criminal matters that form the subject of this prosecution;

2. That Respondent shall complete 200 hours of community service during the course of the six-month license suspension. The 200 hours of community service shall be completed at a place which the Commission approves. Respondent shall submit a reasonable proposal for Commission approval within 60 days of this Order. The entity or entities with which Respondent completes his community service shall supervise the service and report to the Commission when service is completed;

3. That during the course of the license suspension period, Respondent shall enroll in, at his own expense, and shall present evidence acceptable to the Commission indicating that he has successfully completed a course enhancing his competence in the English language to a degree that he can effectively communicate with patients and perform such written and oral tasks as are necessary to practice medicine competently. Respondent shall obtain the approval of the Commission or its successor agency, prior to enrolling or commencing the English language course. Respondent shall submit a reasonable proposal for Commission approval within 60 days of this Order; and be it further

ORDERED that Respondent shall not engage in activities of the type that led to his criminal conviction; and be it further

ORDERED that Respondent shall not violate any other provisions of the Act; and be it further

ORDERED that Respondent shall practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland and shall otherwise comply with all requirements of the Act; and be it further

ORDERED that after the expiration of five (5) years from the date of this Order, the Commission, or its successor agency, will entertain a petition for termination of this Order and will consider a request that Respondent's license be restored to practice medicine without conditional restriction, upon Respondent's demonstrating to the satisfaction of the Commission that he has complied with the terms and conditions of this Order. If the Commission determines that he has not complied with the terms and conditions of this Order, the Commission may modify one or more of the conditions set forth in this Order; and be it further

ORDERED that if Respondent violates any of the foregoing terms of this Order, the stay on the license suspension may be lifted and the Commission, after notification, hearing, and determination of violation, may impose any additional disciplinary sanctions it deems appropriate.

HILARY T. O'HERLIHY MD, Chairman
Maryland Commission on Medical Discipline

In the Matter of
Paul Daniel Miller DO
Before the
Maryland Board of
Physician Quality Assurance

Final Order
Findings of Fact,
Conclusions of Law, and Order

Certain information having come to the attention of the Board of Physician Quality Assurance of Maryland (the "Board"), pursuant to the Medical Practice Act, Health Occupations Article, Annotated Code of Maryland, ("HO") §14-504, voted to charge Paul Daniel Miller DO ("Respondent") with

> Is guilty of immoral conduct in the practice of medicine.§14-504(a)(3) HO and
> Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State. §14-504(a)(22) HO

Notice of the charge and the allegations supporting the charge were given to Respondent by letter dated July 5, 1989. The Board also voted to summarily suspend Respondent's license pursuant to §10-405, State Government Article, Annotated Code of Maryland. However, the Respondent agreed to voluntary surrender his license under §14-503 HO pending the resolution of the outstanding charges against him. The issuance of the summary suspension was stated. A hearing was scheduled before the Office of Administrative Hearings and Appeals on August 7 and 8, 1989. Due to the Respondent's agreement to stipulate to the factual allegations in the charging document, to plea guilty to the charge of §14-504(a)(3) and plea no contest to the charge of §14-504(a)(22), the hearing before the Office of Hearings and Administrative Appeals was cancelled. A hearing before the Board on disposition of the case was held on Wednesday, July 26, 1989. Board members who were not present subsequently read the entire hearing transcript. Board members who had not been present for the entire hearing read the transcribed portion of the hearing for which they had been absent. At the Board meeting on Wednesday, September 27, 1989, all Board members were present and voted on the proposed findings of facts, conclusions of law, and sanction in this case. Respondent and the State were given notice of the proposed decision and an opportunity to file exceptions and make argument to the Board on October 11, 1989. Respondent filed exceptions on October 10, 1989. The State filed no exceptions.

Respondent and the State argued before the Board on Wednesday, October 11, 1989.

On July 26, 1989, the State, through its attorney, Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor, presented the following evidence:

Stipulation as to the Charges

Testimony from Larry Beck, President of Garrett County Memorial Hospital.

A summary of the discharges by physicians with privileges at Garrett County Memorial Hospital, Fiscal Year 1988-1989.

A hand-written summary of Deliveries in Garrett County Memorial Hospital for calendar year 1988.

The Respondent, through his attorney, Robert E. Watson, Esquire, presented the following evidence:

Testimony from Peter Martin Hartmann MD, a Board certified Family Practitioner, and Board eligible psychiatrist from University of Maryland School of Medicine.

Karl Schwalm MD, a partner of Respondent.

Robert A. Goralski MD, a partner of Respondent.

Cheryl Miller, Respondent's wife.

Paul Daniel Miller MD, Respondent.

After considering all evidence, exceptions and argument, by a majority vote of the full authorized members, the Board makes the following decision:

Findings of Fact

By clear and convincing evidence the Board finds that:

1. On or about February 2, 1981, Respondent was licensed to practice medicine in the State of Maryland. (Stipulation)
2. Respondent was licensed to practice medicine in Maryland until July 5, 1989, when he surrendered his license to practice medicine in Maryland and other jurisdictions.
3. From approximately 1982 until July 5, 1989, Respondent practiced family medicine in Oakland, Garrett County, Maryland.
4. As part of Respondent's practice, Respondent practiced gynecology, obstetrics, and counselled patients.
5. Respondent delivered 89 babies in the calendar year 1988 at Garrett County Memorial Hospital.
6. During the fiscal year 1988-1989, Respondent admitted and cared for 550 patients in Garrett County Memorial Hospital.
7. Since Respondent started practicing in Garrett County, Respondent has provided free medical services to the Garrett County High School football team and Garrett County Crossroads.
8. Respondent had the largest practice in Garrett County and was available to his patients at all hours except when he was on vacation. Respondent often saw patients at home.
9. Sometime in 1982, Patient A sought care from Respondent. At the conclusion of each visit, Respondent kissed Patient A on the cheek. Sometime in 1983, at the conclusion of the visit, Respondent kissed

Patient A on the lips. Patient A never returned for care by Respondent.* (Stipulation)

10. In September 1983, Patient A's sister, Patient B sought care from Respondent. At the conclusion of the visit, Respondent asked Patient B when she was going to see her sister. Respondent told Patient B: "Give her this for me," and Respondent "kissed" Patient B. (Stipulation)

11. In September 1983, Patient C was treated by Respondent in the Emergency Room. After Respondent completed the procedure, the nurse left the examining room and Respondent kissed Patient C on the lips. Respondent called Patient C at home and told her that he loved her. Respondent told Patient C to have an affair if she was having marital problems. (Stipulation)

12. On May 28, 1989, Patient D sought care from Respondent. Respondent prescribed Imipramine and suggested counseling. Respondent said that he could provide counseling to Patient D. Patient D met Respondent and after several minutes discussing Patient D's problems, Respondent removed patient D's clothing and attempted to have sex with Patient D. Respondent told Patient D that she should have an affair. (Stipulation)

13. Sometime in 1986, Patient E sought care from Respondent. Respondent called Patient E at home and told her that he dreamed about her. After Patient E confided that she was having marital problems, Respondent suggested that Patient E have an affair. In February 1987, Patient E went to Respondent's office after regular hours and Respondent removed Patient E's blouse and fondled her breasts. Respondent and Patient E kissed for approximately one hour. Respondent explained that his wife did not understand him. One week later, Respondent and Patient E engaged in sex and continued to have sex for approximately 14 months. (Stipulation)

14. Respondent disclosed to the Board that he had sexual relations with five (5) other patients. Tr. pages 139 - 140.

15. In the summer of 1988, Respondent learned that he was being investigated as a result of a complaint filed regarding his sexual behavior with one of his patients. (Tr. 143 - Exception 1)

16. Respondent sought counseling and entered treatment with Dr. Hartmann in January 1989. (Tr. 40 - Exception 2)

17. Respondent has seen Dr. Hartmann for individual therapy and marital counseling since January 1989. (Tr. 55 - Exception 3)

18. Dr. Hartmann was one of Respondent's professors in medical school and knew that Respondent was chief resident in family practice. Dr. Hartmann's opinion was that Respondent was considered a competent physician.

19. Counseling is part of the curriculum in the Family Practice Residency at University of Maryland School of Medicine.

20. The opinion of Respondent's treating psychiatrist is that Respondent's behavior was not a result of a psychiatric illness but resulted from his failure to have normal psychosexual development and his failure to observe boundary lines.

21. The opinion of Respondent's treating psychiatrist is that Respondent has made progress in dealing with the factors that led to his having sexual relations with his patients, and did not deny the inappropriateness and harm caused by his actions.

22. The opinion of Respondent's treating psychiatrist is that it is highly unlikely that Respondent will engage in sexual relations with patients again because Respondent is not denying his actions, Respondent has insight into his problems, and Respondent will be returning to a small town where his actions will be closely monitored.

23. Respondent's partners, Dr. Schwalm and Goralski, are willing to have Respondent return to practice.

24. Respondent's partners, Drs. Schwalm and Goralski expressed the willingness of their other partners to have Respondent return to practice.

25. Dr. Goralski's opinion is that Respondent's patients were extremely loyal to him and would return to him, even knowing of his behavior.

26. Respondent's wife believes that since Respondent had entered therapy, his behavior had changed.

27. Respondent's wife does not believe Respondent will engage in sexual or exploitative relations with patients again.

28. Respondent knows that his behavior was wrong, against professional standards, and harmed his patients.

29. The testimony of Drs. Hartmann, Schwalm, and Goralski and Respondent's wife was credible and trustworthy.

30. The testimony of Respondent was credible insofar as the Board believes that Respondent recognizes the immorality of his conduct, the breach of medical standards by his conduct, and the potential harm to his patients caused by his conduct.

31. The relationship between a family practitioner and his/her patients is one of trust in which the patient is dependent, vulnerable, and relies upon the physician.

32. The relationship between an obstetrician and his/her patients is one of trust in which the patient is dependent, vulnerable, and relies upon the physician for accurate advice and counsel.

33. The relationship between a physician counselor is one of trust in which the patient is dependent, vulnerable, and relies upon the physician for accurate advice and counsel. The patient can be easily exploited and all caution should be exercised not exploit this trust.

34. There is no valid medical treatment that involves sexual contact between a patient and a treating family

* The Board's records contain the names of the patients. However, to protect patient confidentiality, the names of the patients are

practitioner, obstetrician, or counselor during the course of medical treatment.

35. There is no valid medical treatment that involves suggesting a patient have an affair to resolve marital problems.

36. Sexual contact with a patient by a family practitioner, obstetrician, or counselor is exploitative and can harm the patient.

37. Respondent's behavior towards Patients A, B, C, D, and E reflects numerous breaches of medical ethics, and violations of professional standards governing the appropriate practice of family practitioners and similarly situated Maryland practitioners.

38. Respondent violated the trust and dependency placed in him by Patients A, B, C, D, and E.

39. A standard for delivery of quality surgical and medical care in Maryland is to NOT engage in sexual relations with patients.

40. A standard for delivery of quality surgical and medical care in Maryland is to NOT to suggest extramarital affairs to resolve marital problems.

41. As a medical review committee, as defined in §14-601 HO, and as the regulatory Board governing the practice of medicine in Maryland, the Board is an appropriate peer review body to determine whether a licensee has failed to meet appropriate standards for the delivery of quality medical and surgical care in Maryland.

Conclusions of Law

Based on the foregoing Findings of Fact, by a majority of the full authorized membership of the Board considering this case, there is clear and convincing evidence for the Board to determine that as a matter of law that Respondent committed the following acts:

Is guilty of immoral conduct in the practice of medicine. §14-504(a)(3) HO and
Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State. §14-504(a)(22)

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 16th day of October 1989, by a majority of the full authorized membership of the Board considering this case

ORDERED that Respondent's license to practice medicine in Maryland be REVOKED; and be it further

ORDERED that after June 1, 1990, Respondent may file a Petition for Reinstatement of Respondent's License conditioned upon Respondent submitting evidence of the following:

1. That Respondent IMMEDIATELY entered into intensive psychotherapy with Dr. Hartmann or a psychiatrist approved by the Board.

2. That Respondent IMMEDIATELY signed a release allowing the Board to forward to Respondent's therapist a copy of Respondent's testimony.

3. That Respondent is following the psychiatrist's recommendations and continuing in therapy until such time that the therapist certifies to the Board in writing that the Respondent should be discharged, and the Board approves of the cessation of therapy.

4. That Respondent IMMEDIATELY sign a release in order to allow his therapist to file monthly progress reports with the Board, including a summary of his treatment until October 1, 1989 and a report thereafter monthly, and to permit the therapist to report to the Board if Respondent misses an appointment without cause and/or is not following the therapist's recommendations.

5. That Respondent's therapist agreed in writing to file progress reports with the Board to indicate the number and type of appointments Respondent had with the therapist (including missed appointments) and to inform the Board if Respondent terminates therapy prior to approved termination.

6. That on or about May 1, 1990 Respondent submit to an evaluation by a psychiatrist selected by the Board. The evaluation by the psychiatrist will include not only an evaluation of Respondent but a review of the case against Respondent, the record at the hearing, the progress reports of the therapist, and a consultation with Respondent's treating psychiatrist.

7. That the evaluation by the Board's selected psychiatrist is satisfactory and indicated that Respondent can return to the practice of medicine without posing a danger to his patients.

8. That Respondent shall start and successfully complete an ethics course in medical ethics approved by the Board; and

9. That there are no outstanding complaints from patients regarding sexual conduct after January 1, 1989; and be it further

ORDERED that Respondent will bear any costs involved in complying with the Order except the cost of the evaluation by the Board selected psychiatrist; and be it further

ORDERED that Respondent will bear the burden of proving by clear-and-convincing evidence that his license to practice medicine should be reinstated; and be it further

ORDERED that in the event that Respondent's petition for reinstatement of his license to practice medicine in the State of Maryland is granted, the Board may impose whatever conditions the Board thinks necessary to protect public safety, health and welfare; and be it further

ORDERED that in no event will Respondent's Petition for Reinstatement be granted prior to July 5, 1990.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

In the Matter of
Taju-Deen Ohiokephai MD
Before the
Maryland Board of
Physician Quality Assurance

Final Order

On April 27, 1987, the Commission on Medical Discipline, the predecessor agency of the Board of Physician Quality Assurance (the "Board") voted to charge Taju-Deen Ohiokephai MD (the "Respondent") pursuant to Health Occupations Article ("HO") §14-504(1)* and HO §14-504(12).†

The case was referred to the Administrative Prosecutor to draft the charges. The Administrative Prosecutor drafted a charging document charging Respondent under §14-504(a)(1) and (2) forwarded same to the Board for ratification. However, prior to the Board's voting to issue the charging document, the charging document was executed and served on Respondent.

Subsequently, a settlement conference was held and a proposed Consent Order forwarded to the Board. Upon review of the Consent Order, it became apparent that the Board had not voted on the charges.

Therefore, the Board reviewed this case at its meeting on Wednesday, September 13, 1989. The Board voted there was cause to charge Respondent with HO §14-504(a)(11). The Board also agreed to accept the terms of the Consent Order previously executed by Respondent with the charges altered. Counsel for Respondent had previously agreed to waive notification under the Administrative Procedure Act of the new charge provided the terms of the Consent Order remained the same. Therefore, the Board enters into the following Consent Order.

Findings of Fact

1. At all times relevant to these charges, Respondent was and is licensed to practice medicine in Maryland.

2. On July 1, 1982, Respondent began a first year residency program in internal medicine at Prince George's General Hospital ("PGGH"). In his application for residency at PGGH, Respondent indicated that this place of birth was Washington, DC. This statement was false.

3. On March 8, 1983, Respondent applied for a license to practice medicine in Maryland. Respondent checked "U.S.A." to indicate his citizenship upon entering medical school. This statement was false.

4. On November 3, 1983, the Board of Medical Examiners of Maryland issued Respondent License No. D30115.

5. On June 11, 1985, PGGH notified the Board of Medical Examiners that Respondent did not accurately complete his original application for employment at PGGH. Respondent indicated that he was born in Washington, DC. and was a citizen of the United States. PGGH stated that "it now appears that this information is not true and [Respondent] is not a United States citizen, nor does it appear that he has a valid visa at this time."

6. On November 17, 1986, Respondent applied for courtesy privileges at Liberty Medical Center. In his application for employment, Respondent indicated that he was born in Lagos, Nigeria. In his curriculum vitae, Respondent falsely listed his alien number as A21-661-951. Alien number A21-661-951 belongs to Respondent's brother, Rahman Ohiokephai.

7. On February 3, 1988, Respondent applied for approval of relative immigrant visa petition with the United States Department of Justice Immigration and Naturalization Service ("INS"). On June 24, 1988, INS approved Respondent's petition and assigned Respondent file number A28-925-732.

Respondent is classified by INS as B2 visitor who is not authorized to work in the United States.

8. Respondent is currently working at Liberty Medical Center.

9. The practice of medicine includes the application for privileges or the filling out of an employment application to practice medicine.

10. The practice of medicine includes making an application for a license to practice medicine.

Conclusions of Law

Based upon the Findings of Fact, the Board concludes as a matter of law that Respondent "willfully makes or files a false report or record in the practice of medicine;" (HO §14-504(a)(11))

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 23rd day of October 1989, retroactive to August 21, 1987,

ORDERED that Respondent's license to practice medicine in the State of Maryland is SUSPENDED; and that the suspension shall be for a period of sixty (60) days beginning on August 21, 1989; and be it further

ORDERED that Respondent shall surrender his license to practice medicine, his Controlled Dangerous Substances Registration Certificate, and his United States Drug Enforcement Administration Registra-

---

* HO §14-504(1) states:
Fraudulently or deceptively obtains or attempts to obtain a licensee for the applicant or licensee.
HO §14-504(1) was recodified to §14-504(a)(1) effective July 1, 1989 without substantive change.

†HO §14-504(12) states:
Willfully makes or files a false report or record in the practice of medicine.
HO §14-504(12) was recodified to §14-504(a)(11) effective July 1, 1989 without substantive change.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

tion Certificate to the Board at 4201 Patterson Ave., Baltimore, MD 21215; and be it further

ORDERED that Respondent will provide to the Board the necessary work authorization from INS on or about October 21, 1989, or thereafter.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby accept and agree to be bound by the foregoing Order and its conditions and restrictions, consisting of 6 pages.

1. By signing this Consent, I hereby submit to this Order and its conditions. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this consent, I waive all such rights.
2. I understand that if I fail to comply with the conditions enumerated above, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.
3. I am represented by Reginald A. Hawkins-Abdulah Salim, Esquire, and have consulted with him before signing this Order. I sign this Order voluntarily, fully understanding its meaning.

For AIDS Drug Information

Call 1-800-TRIALS-A

NIAID has established a toll-free number for quick access to current information on NIH-sponsored clinical trials for AIDs. One goal of the service is to enroll more blacks, Hispanics, and IVDAs in clinical trials. All calls and information are confidential. Mailed information will be sent in plain envelopes; the caller's name/address will be deleted from the system. Three trained health specialists [one Spanish-speaking] will answer calls Monday-Friday from 9 am to 7 pm EST.

$1,000,000 Celebration

We are pleased to announce that **MED PAY** has funded $1 million in annualized physicians billing since January of this year.

This means no more insurance or collecting hassles for our new clients including:

- Psychiatrist
- Orthopedic Surgeon
- Physical Therapist
- Podiatrist
- Internist

We would be glad to schedule a free consultation to discuss how this timely billing and cash flow (Get paid today for patients seen yesterday and convert your present receivables to cash) program can be of benefit.

Receive Payment Today for Patients Seen Yesterday
Only With

MEDical **PAY**ment Services of Maryland, Inc.

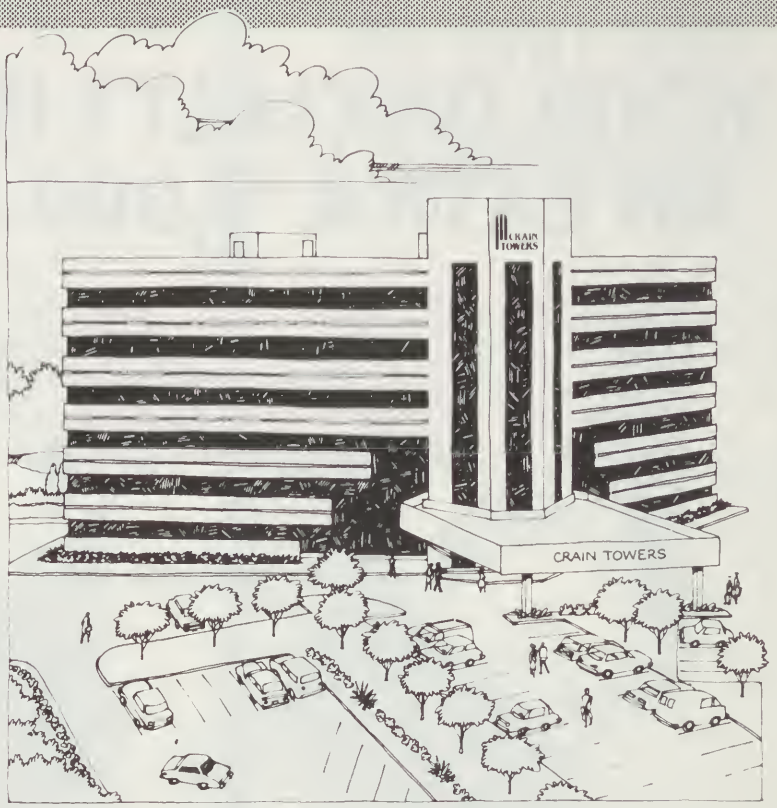
1300 York Road
Suite 150
Lutherville, MD 21093
(301) 828-5050

YOUR SPECIALTY IS WORTH AN EXTRA $8,000 A YEAR.

If you're a resident in any of the following specialties:

- anesthesiology
- orthopedic surgery
- general surgery
- neurosurgery
- colon/rectal surgery
- cardiac/thoracic surgery
- perdiatric surgery
- peripheral/vascular surgery
- plastic surgery

you could be eligible for an $8,000 annual stipend in the Army Reserve's Specialized Training Assistance Program.



You'll also be using your skills in a variety of challenging settings, from major medical centers to field hospitals, and there are opportunities for conferences and continuing education.

We know your time is valuable, so we'll be flexible about the time you serve. Your immediate commitment could be as little as two weeks a year, with a small added obligation later on. If you'd like to talk to an Army Reserve physician, or if you'd like more information about the stipend program or other medical opportunities, call our experienced Army Reserve Medical Counselor.

Ignore these Warnings Signs...

and the Results Could be Fatal!

All Heart Attacks are Not Created Equal!

Heart attacks come in different sizes and shapes. In most cases, they begin with warning signs that tell us something—this is, heart damage and/or death—is impending. The road to destruction and the "crash" of your life has stop-off points that can save you if you recognize the signs.

Chest Pain Emergency Center at St. Agnes Hospital

CHEST PAIN is one of the surest signs of an impending heart attack. PROCEED AT YOUR OWN RISK past that point. Ignoring chest discomfort, even if you think it is just indigestion or heartburn, could lead to serious heart damage or even death.

If you experience chest pain—take the time to check it out.

If you notice someone else with chest pain—convince that person to seek help. Don't let his or her resistance deter you; prompt treatment could be the difference between life and death.

St Agnes Hospital

900 Caton Avenue, Baltimore, MD 21229
Dr. Raymond Bahr, **301-368-3201**

Heart Attacks Don't Have To Kill. They Only Do So When The Warning Signs Are Ignored.

The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative *Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf— specialists who know health care *and* insurance — so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton Insurance Company. Call your independent insurance agent today.

Maryland. Tried & True.

It's true. In today's rapidly changing health care environment, your professional liability insurance must be strong, stable, and reliable. You shouldn't have to worry about whether your company will still be here to protect you in the future.

For more than a decade, thousands of Maryland physicians have found the protection they need with Medical Mutual Liability Insurance Society of Maryland. A financially sound, conservatively managed specialty insurer, Medical Mutual is recognized as expert in the area of professional liability insurance.

Backed by a professional staff with years of experience in underwriting, claims handling, and risk management, our professional liability insurance provides strong, reliable protection—plus the expertise, service and attention that only a specialty insurer can offer.

We are proud to be serving thousands of your colleagues already, Maryland physicians who have found the right combination of protection, flexibility, and service for their practices. If you haven't met us yet, call your broker or call our Member Services Department at 1-800-492-0193.

Caring with Excellence

A Choice.

Just what the doctors ordered.

Now that you have a choice of professional liability insurers, how do you compare your options? Consider these important points:

- **The protection you get from your policy**

Princeton's exclusive *Occurrence Plus* policy gives you comprehensive protection - including "tail" coverage - that's complete when purchased. With some other policies on the market, you might wait years before receiving such coverage.

- **The company's experience in medical malpractice claims management**

Princeton is known for providing a strong defense against meritless claims, and that helps protect your professional reputation. Our exceptional claims management record reflects our years of experience in resolving medical malpractice cases.

- **The company's financial strength and stability**

With its parent organization, Princeton Insurance Company ranks as the nation's 12th largest professional liability carrier for medical professionals. And Princeton has one of the lowest loss ratios among the top 20.

To learn more about how Princeton compares, contact one of the independent insurance agents that represent Princeton.

ARTICLES

Introduction - AIDS: Living Long and Living Well 147
MMJ Editorial Board

AIDS - Living Long and Living Well: An Idea Whose Time Has Come 148
Donald M. Pachuta MD

Management of Patients with Asymptomatic HIV Infection 150
John G. Bartlett MD

As much or more is now known about AIDS as about any other infection. Very recent developments permit medical intervention at an early stage when the patient lacks symptoms.

Prevention of Opportunistic Infections in Patients with HIV Infection 156
Richard E. Chaisson MD

Improvements in antiretroviral therapy and prevention of opportunistic infections have significantly prolonged survival of patients with advanced HIV disease. Physicians caring for patients with HIV infection should adopt aggressive and early measures to prevent HIV-related opportunistic disease.

The Role of Antiretroviral Therapy in Living Long and Living Well 161
John J. Zurlo MD and H. Clifford Lane MD

The dramatic increase in types of antiviral strategies and numbers of specific antiviral agents emerging since the early 1980s have changed the prognosis of HIV infection. A disease once viewed as an automatic death warrant is now in the process of becoming a chronic, potentially long-term treatable illness.

Pediatric AIDS Care in Maryland 167
John P. Johnson MD

The complexities of care for persons at risk for or infected with human immunodeficiency virus (HIV) are no greater for any other population than for children. Their unusual medical, social, and public health considerations have demanded a separate system of care.

An Integrated Primary Care System for HIV Disease 173
Mark D. Smith MD

Although a "cure" for HIV infection has not yet been found, there are increasing numbers of options for treatment. Like other more familiar diseases, HIV/AIDS present lifelong management responsibilities for both patient and clinician.

The Emerging Physician-Patient Partnership 177
Robert M. Mehl

A person with AIDS comments on personal philosophies, the change in physician-patient relationships, and the political impact of the AIDS epidemic on health care services.

Commentary - Exceptional Patients Live Long and Live Well 181
Bernie S.Siegel MD
"Exceptional " patients have certain characteristics in common.

Integrating Traditional Medicine with Other Therapies in the Treatment of HIV-Infected Individuals 183
Charles L. Steinberg MD
Individuals affected by HIV have brought a high level of intelligence, assertiveness, and motivation to the exploration of new therapies. Much is being tried and learned outside "traditional" medicine.

Living Long and Living Well: The Role of the Physician's Attitude 189
Donald M. Pachuta MD
Physicians need to examine their attitudes and beliefs, to stimulate discussion of new therapeutic strategies, and to consider what they can do individually and collectively to help combat the epidemic of HIV infection.

Can One Insurance Agency Handle All Of Your Policies?

Contemporary Insurance Services:

* Is prepared to advise you concerning all malpractice insurers and can place your coverage with any company
* Carries very low cost term insurance and high-grade universal and whole life products
* Carries excellent disability, overhead and buy-sell products with liberal policy definitions and competitive rates
* Carries excellent health insurance products
* Carries excellent office liability products

Contemporary Insurance Services is one of the largest brokers of malpractice insurance to Maryland physicians. Many of our clients rely on us for all of their insurance needs. Let us show you why many of our clients prefer to handle all of their insurance needs through one agent.

In today's market, you need an insurance broker you can rely on. For more information, complete and return:

Name_____

Address_____

Cancer Treatment Dictates Not Just Keeping Up But Leading The Field In Technology And Excellence.

Cancer Care for the Montgomery County area has taken a significant step forward with the addition of Radiation Therapy at Montgomery General Hospital in Olney, Maryland. The MGH Cancer Center offers your patients convenient access to:

Full Time Board Certified Physician.

Jed Pollack, M.D. serves as Medical Director of the Center. Dr. Pollack is an experienced Radiation Oncologist, who will provide appropriate care, while communicating to you the progress of your patient during treatment.

State-Of-The-Art Treatment Equipment

MGH Cancer Center features a linear accelerator capable of treating virtually all cancers that are receptive to radiation radiation therapy.

Treatment Planning And Treatment In One Location.

The MGH Cancer Center has assembled all the special equipment and staffing necessary to plan, prepare and treat patients in one easily accessible, pleasant facility.

Current Treatment Guidelines for Sexually Transmitted Diseases

The Centers for Disease Control published updated treatment guidelines for Sexually Transmitted Diseases (STD) in Morbidity and Mortality Weekly Report, September 1, 1989 Vol. 38, No. S-8.

In the last issue we provided the treatment guidelines for early, late latent, cardiovascular and neurosyphilis, and a protocol for syphilis diagnosis and treatment. In this issue, we will provide, abstracted from the above cited MMWR, guidelines for Penicillin Therapy, Jarisch-Herxheimer reaction, Persons Exposed to Syphilis, Syphilis in Pregnancy, Congenital Syphilis and Syphilis in HIV-infected Patients. The 1989 Sexually Transmitted Diseases Treatment Guidelines are being reprinted in their entirety and will be available in 4 weeks. Interested health care providers may obtain copies by contacting their local health department.

Penicillin Therapy

Penicillin is the preferred drug for treating patients with syphilis. Penicillin is the only proven therapy that has been widely used for patients with neurosyphilis, congenital syphilis, or syphilis during pregnancy. For patients with penicillin allergy, skin testing with desensitization, if necessary, is optimal (see 1989 STD Treatment Guidelines). However, the minor determinant mixture for penicillin is not currently available commercially.

Jarisch-Herxheimer Reaction

The Jarisch-Herxheimer reaction is an acute febrile reaction, often accompanied by headache, myalgia, and other symptoms, that may occur after any therapy for syphilis, and patients should be so warned. Jarisch-Herxheimer reactions are more common in patients with early syphilis. Antipyretics may be recommended, but no proven methods exist for preventing this reaction. Pregnant patients, in particular, should be warned that early labor may occur.

Persons Exposed to Syphilis (Epidemiologic Treatment)

Persons sexually exposed to a patient with early syphilis should be evaluated clinically and serologically. If the exposure occurred within the previous 90 days, the person may be infected yet seronegative and therefore should be presumptively treated. (It may be advisable to presumptively treat persons exposed more than 90 days previously if serologic test results are not immediately available and follow-up is uncertain.) Patients who have other STD may also have been exposed to syphilis and should have a serologic test for syphilis. The dual therapy regimen currently recommended for gonorrhea (ceftriaxone and doxycycline) is probably effective against incubating syphilis. If a different, non-penicillin antibiotic regimen is used to treat gonorrhea, the patient should have a repeat serologic test for syphilis in 3 months.

Syphilis in Pregnancy

Screening

Pregnant women should be screened early in pregnancy. Seropositive pregnant women should be considered infected unless treatment history and sequential serologic antibody titers are showing an appropriate response. In populations in which prenatal care utilization is not optimal, patients should be screened, and if necessary, treatment provided at the time pregnancy is detected. In areas of high syphilis prevalence, or in patients at high risk,

screening should be repeated in the third trimester and again at delivery.

Treatment

Patients should be treated with the penicillin regimen appropriate for the woman's stage of syphilis. Tetracycline and doxycycline are contraindicated in pregnancy. Erythromycin should not be used because of the high risk of failure to cure infection in the fetus. Pregnant women with histories of penicillin allergy should first be carefully questioned regarding the validity of the history. If necessary, they should then be skin tested and either treated with penicillin or referred for desensitization (see 1989 STD Treatment Guidelines). Women who are treated in the second half of pregnancy are at risk for premature labor and/or fetal distress if their treatment precipitates a Jarisch-Herxheimer reaction. They should be advised to seek medical attention following treatment if they notice any change in fetal movements or have any contractions. Stillbirth is a rare complication of treatment; however, since therapy is necessary to prevent further fetal damage, this concern should not delay treatment.

Follow-Up

Monthly follow-up is mandatory so that retreatment can be given if needed. The antibody response should be the same as for nonpregnant patients.

HIV Testing

All syphilis patients should be counseled concerning the risks of HIV and be encouraged to be tested for HIV antibody.

Congenital Syphilis

Who Should be Evaluated

Infants should be evaluated if they were born to seropositive (nontreponemal test confirmed by treponemal test) women who:

- Have untreated syphilis; **or**
- Were treated for syphilis less than 1 month before delivery; **or**
- Were treated for syphilis during pregnancy with a non-penicillin regimen; **or**
- Did not have the expected decrease in nontreponemal antibody titers after treatment for syphilis; **or**
- Do not have a well-documented history of treatment for syphilis; **or**
- Were treated but had insufficient serologic follow-up during pregnancy to assess disease activity.

An infant should not be released from the hospital until the serologic status of its mother is known.

Evaluation of the Infant

The clinical and laboratory evaluation of infants born to women described above should include:

- A thorough physical examination for evidence of congenital syphilis
- Nontreponemal antibody titer CSF analysis for cells, protein, and VDRL
- Long bone x-rays
- Other tests as clinically indicated (e.g., chest x-ray)
- If possible, FTA-ABS on the purified 19S-IgM fraction of serum (e.g., separation by Isolab columns)

Therapy Decisions

Infants should be treated if they have:

- Any evidence of active disease (physical examination or x-ray); **or**
- A reactive CSF-VDRL; **or**
- An abnormal CSF finding (White blood cell count > 5/mm^3 or protein > 50 mg/dl)* regardless of CSF serology; **or**
- Quantitative nontreponemal serologic titers that are fourfold (or greater) higher than their mother's; **or**
- Positive FTA-ABS-19S-lgM antibody, if performed.

Even if the evaluation is normal, infants should be treated if their mothers have untreated syphilis or evidence of relapse or reinfection after treatment. Infants who meet the criteria listed in "Who

Should be Evaluated" but are not fully evaluated, should be assumed to be infected, and treated.

*In the immediate newborn period, interpretation of these tests may be difficult; normal values vary with gestational age and are higher in preterm infants. Other cases of elevated values should also be considered. However, when an infant is being evaluated for congenital syphilis, the infant should be treated if test results cannot exclude infection.

Treatment

Treatment should consist of: 100,000-150,000 units/kg of **aqueous crystalline penicillin G** daily (administered as 50,000 units/kg IV every 8-12 hours) or 50,000 units/kg of **procaine penicillin** daily (administered once IM) for 10-14 days. If more than 1 day of therapy is missed, the entire course should be restarted. All symptomatic neonates should also have an ophthalmologic examination.

Infants who meet the criteria listed in "Who Should be Evaluated" but who after evaluation do not meet the criteria listed in "Therapy Decisions," **are at low risk for congenital syphilis. If their mothers were treated with erythromycin during pregnancy,** or if close follow-up cannot be assured, they should be treated with **benzathine penicillin G,** 50,000 units/kg IM as a one-time dose.

Follow-Up

Seropositive untreated infants must be closely followed at 1, 2, 3, 6, and 12 months of age. In the absence of infection, nontreponemal antibody titers should be decreasing by 3 months of age and should have disappeared by 6 months of age. If these titers are found to be stable or increasing, the child should be reevaluated and fully treated. Additionally, in the absence of infection, treponemal antibodies may be present up to 1 year. If they are present beyond 1 year, the infant should be treated for congenital syphilis.

Treated infants should also be observed to ensure decreasing nontreponemal antibody titers; these should have disappeared by 6 months of age. Treponemal tests should not be used, since they may remain positive despite effective therapy if the child was infected. Infants with documented CSF pleocytosis should be reexamined every 6 months or until the cell count is normal. If the cell count is still abnormal after 2 years, or if a downward trend is not present at each examination, the infant should be retreated. The CSF-VDRL should also be checked at 6 months; if it is still reactive the infant should be retreated.

Therapy of Older Infants and Children

After the newborn period, children discovered to have syphilis should have a CSF examination to rule out congenital syphilis. Any child who is thought to have congenital syphilis or who has neurologic involvement should be treated with 200,000-300,000 units/kg/day of **aqueous crystalline penicillin G** (administered as 50,000 units/kg every 4-6 hours) for 10-14 days. Older children with definite acquired syphilis and a normal neurologic examination may be treated with **benzathine penicillin G,** 50,000 units/kg IM, up to the adult dose of 2.4 million units. Children with a history of penicillin allergy should be skin tested and, if necessary, desensitized (see 1989 STD Treatment Guidelines). Follow-up should be performed as described previously.

HIV testing

In cases of congenital syphilis, the mother should be counseled concerning the risks of HIV and be encouraged to be tested for HIV; if her test is positive, the infant should be referred for follow-up.

Syphilis in HIV-Infected Patients

Diagnosis

- All sexually active patients with syphilis should be encouraged to be counseled and tested for HIV because of the frequency of association of the two diseases and the implications for clinical assessment and management.
- Neurosyphilis should be considered in the differential diagnosis of neurologic disease in HIV-infected persons.
- When clinical findings suggest that syphilis is present but serologic tests are negative or confusing, alternative tests, such as biopsy of lesions, dark-field examination, and direct fluorescent antibody staining of lesion material, should be used.
- In cases of congenital syphilis, the mother should be encouraged to be counseled and tested for HIV; if her test is positive, the infant should be referred for follow-up.

Treatment and Follow-Up

- Penicillin regimens should be used whenever possible for all stages of syphilis in HIV-infected patients. Skin testing to confirm penicillin allergy may be used if minor and major determinants are available (see 1989 STD Treatment Guidelines). However, data on its use in HIV-infected individuals are inadequate. Patients may be desensitized and treated with penicillin.
- No change in therapy for early syphilis for HIV-coinfected patients is recommended. However, some authorities advise CSF examination and/or treatment with a regimen appropriate for neurosyphilis for all patients coinfected with syphilis and HIV, regardless of the clinical stage of syphilis. In all cases, careful follow-up is necessary to ensure adequacy of treatment.
- HIV-infected patients treated for syphilis should be followed clinically and with quantitative nontreponemal serologic tests (VDRL, RPR) at 1, 2, 3, 6, 9, and 12 months after treatment. Patients with early syphilis whose titers increase or fail to decrease (see section on "Follow-Up, Early Syphilis") fourfold within 6 months should undergo CSF examination and be retreated. In such patients, CSF abnormalities could be due to HIV-related infection, neurosyphilis, or both. STD clinics and other providers of STD treatment should ensure adequate follow-up.

Management of Patients with Histories of Penicillin Allergy

Currently, no proven alternative therapies to penicillin are available for treating patients with neurosyphilis, congenital syphilis, or syphilis in pregnancy. Therefore, skin testing -- with desensitization, if indicated -- is recommended for these patients.

Skin Testing

Skin testing is a rapid, safe, and accurate procedure (see 1989 STD Treatment Guidelines). It is also productive; 90% of patients with histories of "penicillin allergy" have negative skin tests and can be given penicillin safely. The other 10% with positive skin tests have an increased risk of being truly penicillin-allergic and should undergo desensitization. Clinics involved in STD management should be equipped and prepared to do skin testing or should establish referral mechanisms to have skin tests performed.

Skin testing is quick; four determinants, along with positive and negative controls, can be placed and read in an hour (See 1989 STD Treatment Guidelines). Skin testing is also safe, if properly performed. Patients who have had a severe, life-threatening reaction in the past year should be tested in a controlled environment, such as a hospital setting, and the determinant antigens diluted 100-fold. Other patients can be skin-tested safely in a physician-staffed clinic. Patients with a history of penicillin allergy but with no reaction to penicillin skin tests, who are not on antihistamines and who had a positive histamine control on skin testing (See 1989 STD Treatment Guidelines for details), should be given **penicillin**, 250 mg orally, and observed for one hour. Patients who tolertate this dose well may be treated with penicillin as needed.

Desensitization

Patients who have a positive skin test to one of the penicillin determinants can be desensitized. This is a straightforward, relatively safe procedure. Although the procedure can be done orally or intravenously, oral desensitization is thought to be safer, simpler, and easier. Desensitization should be done in a hospital setting because serious IgE-mediated allergic reaction, although unlikely, can occur. Desensitization can be completed in 4 hours, after which the first dose of penicillin is given (See table in 1989 STD Treatment Guidelines for further details). STD programs should have a referral center where patients with positive skin tests can be desensitized. After desensitization, patients must be maintained on penicillin for the duration of therapy.

The Personality Disorder Treatment Program of Sheppard Pratt Hospital

Very often, specialized inpatient evaluation and treatment is a critical step in the effective long-term care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Extended stay intensive inpatient treatment
- ☐ Intermediate stay crisis intervention
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychopharmacology evaluation and treatment
- ☐ Psychotherapy consultation

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

Major Issues in the Treatment of Hyperactive/Inattentive Children

Stimulant treatment of hyperactive/inattentive youngsters has become a media event once again, in large measure because a few sensationalistic reporters and self-styled experts have attempted to make the issue a frightening and thus controversial one. In contrast, scientific writings on the subject exhibit far greater agreement than disagreement and have raised some concerns but no alarm. To briefly focus on some of the major issues that have stirred the public interest, the following often-asked questions will be considered.

Question: How many school children are on stimulant treatment for hyperactivity/inattentiveness in the United States?

Answer: A conservative estimate is 3/4 million or 1.5 to 2 percent of the school-aged population.

Question: Do more students in Maryland receive stimulant medication than their counterparts from other states?

Answer: Yes,[2] but the reasons for this are unclear since stimulant medication treatment in Utah and Georgia is about the same as in Maryland.

Question: Aren't major law suits pending on the use of stimulant treatment?

Answer: No. The threatened and pending law suits in general appear to lack merit and are part of a well-financed campaign sponsored mainly by the Church of Scientology[3] to get the media to publicize complaints about stimulant medication for hyperactivity.

Question: Who should be considered for a trial of stimulant treatment?

Answer: Primarily children with a persistent *developmental* pattern of restlessness/inattentiveness/impulsivity who because of these characteristics exhibit serious maladjustment in their classrooms and possibly at home.[4-7]

Question: Should more conservative treatment be tried first?

Answer: Systematic family and/or school behavior modification efforts should be tried early, particularly if such services are available and affordable, the child is young, the severity of the problem is minor to moderate, and the involved adults are motivated to establish baseline ratings, follow a contract, give meaningful reinforcers, assist in the modification of procedures, etc.[5-7]

Question: Is stimulant medication with educational counseling a sufficient treatment intervention?

Answer: During the early and mid-elementary school period (provided the disorder is uncomplicated and the environment is supportive) stimulant treatment with educational counseling by the physician is often sufficient. For those hyperactive children with a multitude of associated problems, comprehensive treatment programs (including behavior modification, stimulant treatment, and educational remediation) can be more useful.[8,9]

Question: Should the schools be involved in the identification of hyperactive children?

Answer: Schools have the responsibility to identify problems that seriously interfere with classroom adjustment and learning and to work toward their remediation using available school personnel, parental support, and/or the assistance of parentally authorized health care professionals.[4,5]

Question: Should school staff assist in the evaluation of medication treatment outcome?

Answer: If major and persisting classroom problems ultimately lead to a trial of medication, then the treating physician should be informed if his/her treatment is useful and if it remains useful. Close teacher-physician monitoring improves treatment results, but less than half of all students in the US on stimulant treatment receive this necessary assessment.[4,10,11]

Question: Is stimulant medication appropriately and usefully prescribed for hyperactivity?

Answer: In a recent study of public school primary and secondary students on stimulant medication from community physicians, it was found that 76 percent of the youth were clearly and measurably hyperactive and that another 15 percent were notably inattentive before treatment was begun. Furthermore, 93 percent of those on medication initially exhibited prominent benefits from it. Nonetheless, an average of two years later, only 76 percent were still clearly benefiting from the medication.[12] A similar result was obtained by Sleator et al. using a one-month placebo substitution in a school study of stimulant treatment. They found that 25 percent of the children did as well on placebo as on methylphenidate.[13] Thus an average of 25 percent of those maintained on stimulant medication were not clearly benefiting. Such findings again point to a greater need for regular school-based monitoring of the treatment, including annual trials off medication.

Question: Does stimulant treatment result in serious side effects?

Answer: Long-term stimulant treatment for hyperactivity is quite safe.[4-7] Stimulants have been used to treat hyperactivity for over 50 years, and no permanent adverse effects or deaths have been reported from their use. Growth suppression induced by stimulant medication is now generally recognized as a temporary phenomenon.[14] When side effects to stimulant treatment occur, they are characteristically minor and in

nearly all cases prominently lessen or cease following weeks of continued use.[5-7] When the need presents, a dose reduction also will accomplish this. Of note is a stimulant-induced accentuation of tics or vulnerability to tic movements, which occurs in a small percentage of hyperactive children.[15] As such, this fully reversible medication side effect presents no major difficulty for experienced physicians.

Question: Does stimulant treatment in childhood increase the risk of later substance abuse?
Answer: No.[16]

Question: Aren't stimulants a quick fix?
Answer: In the 75 percent of treatment cases when medication is measurably successful, it results in rapid improvement.[5-7] However, it commonly produces only a partial "fix." That is, whereas it quickly lessens undue restlessness, inattentiveness, and impulsiveness in the classroom, it does not resolve learning problems and pervasive behavior problems.[11] Furthermore, its effects don't persist after the cessation of treatment. If behavior modification/educational remediation is the slow "fix," it too is only a partial one. After stopping these interventions, a gradual decline in their relative benefits takes place, usually within 4 to 12 months.[5]

Question: Do stimulants improve learning?
Answer: Stimulants commonly improve short-term memory, attention span, completion of school work, grades and handwriting.[11] However, in long-term outcome studies, other factors (such as genetic endowment/IQ and family support) are prominently related to academic outcome,[16,17] not a history of stimulant treatment.

Question: Does stimulant treatment have long-term behavioral benefits?
Answer: Stimulant treatment clearly reduces hostile interchanges between parent and child and between teacher and pupil,[18,19] and it tends to reduce grade retention and referral to special education. However, long-term outcome studies again reveal that other factors have far more impact on late adolescent and young adult behavior patterns than does prior stimulant treatment.[16,20]

Question: Isn't the diagnosis of attention deficity hyperactive disorder vague?
Answer: When the developmental history and background data are obtained in some detail and the child's attentional/hyperactive patterns are found to be persisting, major, and generalized, the diagnosis is usually evident. The diagnosis is not established on the basis of one teacher's report. Extensive additional diagnostic work is useful and particularly necessary to evaluate problems that commonly coexist with developmental hyperactivity, such as conduct disorder and learning disability. The extended evaluation then mainly determines how broad based treatment perspectives will need to be.

Question: Do scientists know the cause for hyperactivity?
Answer: Nothing is firmly established except that genetic factors play a major causative role in 10 to 35 percent of cases of hyperactivity.[21] Almost all the other likely etiologic factors and correlational links to hyperactivity are biological in nature.[5]

Announcing a cure for the common computer.

Is your practice computer system chronically ill? Or perhaps you're just not getting access to the information you need? At MEDSOURCE, we have the expertise to diagnose and treat your data problems. Whether it's analyzing data for negotiation with HMOs, coordinating clinical research projects or tracking patient care, MEDSOURCE can provide you with healthy, accurate data every time.

We can assist you in the selection of medical record and accounting systems. We'll install new equipment and train your staff. We can even develop customized programs to help you make new use of existing data.

MEDSOURCE's 13 years of experience in computer programming and our in-depth knowledge of the clinical health care field make us the expert in computer systems for practice management. So, the next time you find yourself diagnosing your computer instead of your patients, call MEDSOURCE.

February 1990

Join the Team. Be a Part of Project 1%

Med Chi and the Medical Mutual Liability insurance society have worked hard to lower liability insurance premiums and now their efforts are paying off *for you*. Since 1988, many Maryland physicians have received a 30% **reduction** in liability insurance premiums due in large part to legislative reforms. To help keep these low rates, all Maryland physicians are urged to join Project 1%, a new program that will provide ongoing research and objective data necessary to promote a better understanding of issues involving access and quality of health care in Maryland. To fund this research, Med Chi is asking physicians to contribute at least 1% of your premium reduction to Med Chi's Charitable Educational Trust. This contribution is tax deductible and will be used solely for research and education. To make a contribution to Project 1% send a check or money order made payable to the Charitable Educational Trust, to Project 1%, Med Chi, 1211 Cathedral St., Baltimore, MD 21201. For more information, contact Med Chi's Communications Department at 1-800-492-1056 or in Baltimore, 301-539-0872.

5% Premium Discount for Physicians tending Seminar

During a press conference held on January 5, 1990, Med Chi President Raymond M. Atkins MD and Medical Mutual Chief Executive Officer Raymond M. Yow MD announced their sponsorship of a workshop for physicians entitled, "Effective Communications: A Risk Management Strategy." Dr. Yow stated that, "Because communication plays an important role in professional liability, Med Mutual will offer a 5% premium discount on 1991 medical professional liability renewal policies to all Med Mutual members who successfully complete this workshop in 1990." The workshop, provided by Communications Systems, Inc., fulfills 3 Category 1 CME credits and will teach physicians how improved communications skills can enhance the quality of care and reduce the risk of malpractice claims. For more information regarding dates of the seminar and registration information, contact Betsy Newman, Med Chi Public Relations at 1-800-492-1056 or in Baltimore, 301-539-0872.

1990 Annual Meeting

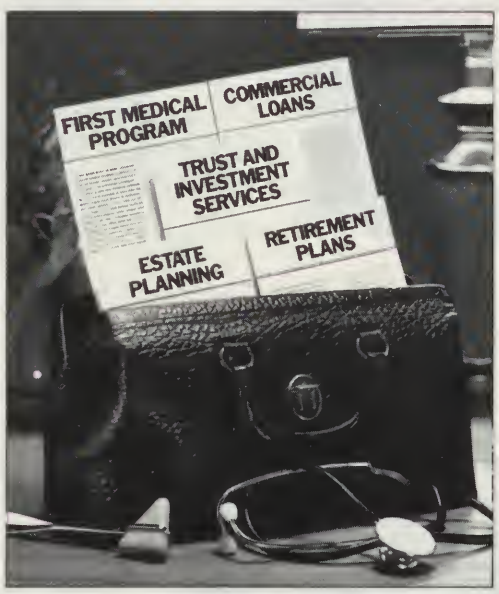
AMA Trustee Lonnie Bristow MD, will speak on "Health Care Financing: An American Solution" at the plenary session during Med Chi's 1990 Annual Meeting "The 1990s: What Can We Expect?", to be held on May 9-11, 1990 at Turf Valley Hotel and Country Club in Ellicott City, MD. Thomas Reardon MD, a commissioner from the Physician Payment Review Commission (PPRC) will speak on, "Physician's Payment, Potential Changes:

Issues and Answers." The PPRC is the key commission regulating Medicare fees and in developing new physician pa ment systems. Watch for registration and hotel reservation inf mation in upcoming issues of the *MMJ*.

Med Chi Warning on Home Medical Equipment

Med Chi has heard from a number of physicians regarding t inappropriate solicitation of Medicare beneficiaries by dura home medical equipment suppliers. Physicians are remind that physician certification of medical necessity must accompa all claims for durable medical equipment. Effective January 1990, the Maryland carrier will not consider certifications co pleted by anyone other than the prescribing/certifying physici who signs the certification as acceptable evidence of the medi necessity of durable medical equipment. The Maryland Att ney General's Office has documented several cases where me cal equipment suppliers have used questionable marketi and/or advertising techniques to convince Medica beneficiaries that they need various home medical equipm and/or supplies and that Medicare will pay for these suppli In September 1989, Med Chi and BCBS of Maryland urg Medicare recipients to check with their physician before purch ing home medical equipment. As a result of these warnings, least one medical equipment supplier has left the state.

Physician Assistant Regulations



Physicians are reminded that Maryland law requires t physician assistants may only perform those delegated medi acts outlined in the job description submitted to the Board Physician Quality Assurance. "Job description, means a do ment executed by a physician assistant and physician that h been approved under this title to permit the delegation of me cal acts to a certified physician assistant" (HO.Sec.14.5-101(Any physician assistant who performs medical acts (or a physician who aids that practice) not outlined within the description is subject to disciplinary action by the Boa (HO.Sec.14-504(a)(18), Sec.14-5-312(5)).

Med Chi helps to defeat ETs

Med Chi thanks all those Maryland physicians who help defeat the Expenditure Targets proposal in 1989. The AM lobbied hard to prevent this proposal that would have limited the amount paid for physician's services under Medica Following the defeat of ETs Congress created the Medic volume performance standard (MVPS), a mechanism to prov detailed data to Congress on service volume and intensity ch ges. Under MVPS, the Secretary of Health and Human Servi must analyze the factors behind the growth in expenses such patient demand, new technology, and the aging and the grov of the Medicare population. The AMA is optimistic that MV will provide a more rational and equitable analysis of the curr system.

Angelo J. Troisi, FA
Executive Dire

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

First National Bank of Maryland

Don't Ignore Chest Pain!

Ignoring chest pain can be as much of a risk factor in heart attacks as elevated cholesterol, smoking or high blood pressure

Treatment in the first two hours of a heart attack saves vital heart muscles, speeds recovery. Nearly 70% of heart attack sufferers die within two hours of an attack.

Every family should have at least one member who is trained in CPR and alert to the need to act quickly at the first onslaught of chest discomfort or pain. This emergency care giver is essential.

Community education programs and the establishment of chest pain emergency centers in community hospitals can reduce fatalities.

New drugs and techniques often ensure full recovery and quality of life if the victim seeks medical care quickly at the first sign of chest pain or discomfort.

Psychological factors of denial or delay must be avoided by anyone suffering chest pain or chest discomfort.

The Chest Pain Emergency Center at St. Agnes Hospital, Baltimore, is a successful model.

Chest Pain Emergency Center at St. Agnes Hospital

In Baltimore, St. Agnes Hospital operates a seven-bed Chest Pain Emergency Center. Immediately upon arrival, a patient with chest pain is rushed through a special entrance to the Chest Pain Emergency Center. A trained team of doctors and nurses immediately analyze the patient's condition and begin stabilization procedures. There is no delay. Patients continue to be monitored until they are transferred to the hospital's Coronary Care Unit. For more information about early chest pain warning and treatment, details about establishing a Chest Pain Emergency Center in a community hospital or a free video tape describing how to network with your community and set up a cardiac outreach program, write or call Dr. Raymond D. Bahr, St. Agnes Hospital, 900 Caton Avenue, Baltimore, MD 21229, **(301) 368-3217.**

Introduction
AIDS: Living Long and Living Well

As the debate over the AIDS epidemic rages, there is no area more controversial than the efficacy of various treatments for the disease. The mainstream medical community, while holding out some hope in recently developed treatments, is far from claiming or believing that a cure has been developed. However, as with many of the other diseases that have frustrated man's best efforts to thoroughly understand and cure them, non-traditional treatment modalities have become popular among AIDS sufferers who do not see an imminent cure in traditional medicine.

While waiting for a truly reliable treatment to be found, tested, and approved, many AIDS sufferers have turned to the unproved but apparently medically harmless treatments that may result in a physical or psychological advantage in battling the disease. It is hoped that such treatments prolong life. If such extra time means being closer to receiving a medical cure, the administration of the treatment may be of value. This issue of *MMJ* explores many of the traditional and some of the less traditional approaches to the treatment and prevention of AIDS with the hope of broadening the discussion of the disease and of providing direction for interim measures to today's AIDS sufferer who may be tommorow's AIDS survivor.

MMJ Editorial Board

AIDS - Living Long and Living Well: An Idea Whose Time Has Come

Donald M. Pachuta MD

The author is Chairman of the Medical and Chirurgical Faculty Committee on AIDS and acted as guest editor for this issue.

We think that time is now for living long and living well with HIV-1 infection and AIDS.

Since the beginning of the AIDS epidemic, we have been bombarded by a great deal of negativity. We have been led to believe that this will be the first epidemic in history with a 100 percent mortality rate, everyone with Human Immunodeficiency Virus type l (HIV-1) infection will eventually develop AIDS, and, therefore, the presence of HIV-l in a person is a death sentence. Could all this be a self-fulfilling prophecy? Has it been up to now? Can we change it?

Unlike previous epidemics, patient care has been particularly complicated throughout this one. People have turned away from traditional medicine in large numbers seeking anything that would alter these fatalistic predictions. It has been difficult to do controlled trials in research because many/most of the subjects in some areas of the country are taking multiple other medications without telling their physicians or the investigators.

The governmental response has been severely criticized by the Congress, the news media, physicians, and the gay community among others. Policy making has been called over-reactive, detached from reality, and crisis driven for the last nine years.[1,2] Physicians have confronted difficulties including information overload; inadequate reimbursement; fears of infection, of loss of other patients, and of death; hopelessness; ethical dilemmas; burnout; dislike of the patient populations; and homophobia.[3,4]

This is an epidemic of discrimination.[5] People are being denied insurance as well as their fundamental rights to employment, housing, education, etc. Family, friends, and lovers frequently reject or ostracize them leading to loneliness and depression. Sadly, ignorance and fear still abide with us.

Through all of this there is a great deal of good news. When the Medical and Chirurgical Faculty of Maryland Committee on AIDS discussed and planned a series of articles for this special issue of *MMJ*, we thought we could best serve everyone by adopting the theme of our committee: *Living long and living well with AIDS and HIV-1 infection is an idea whose time has come.*

Dr. Louis W. Sullivan, Secretary of the Department of Health and Human Services, and Dr. Anthony S. Fauci, Head of the National Institutes of Allergy and Infectious

Diseases, declared that HIV-1 infection should be regarded as a chronic, manageable disease, like diabetes. Several of our authors echo their sentiments.

From the myriad of possible topics and potential articles, we have selected those we believe will reflect this optimism, relieve fear, overcome negativity, offer an education as well as hope for physicians, caregivers, their patients, and the public; stimulate their intellectual curiosity; challenge participation in helping relieve the suffering of the epidemic; and perhaps suggest some new ideas.

The update by Dr. John Bartlett, Chief of the Infectious Disease Division at Johns Hopkins University School of Medicine and one of the leading authorities in the world on the management of asymptomatic HIV-1 infection, presents the latest research. He also presents an excellent discussion of counseling and the impact of social and financial issues.

The discussion by Dr. Richard Chaisson, Director of AIDS Services at Johns Hopkins Hospital, on the prevention of infection is likewise a synthesis in an area that seems so complex to most physicians but is really quite straightforward and simple in the way he presents it.

Drs. John Zurlo, Asstistant Director, and H. Clifford Lane, Deputy Clinical Director of the National Institutes of Allergy and Infectious Diseases present the latest research on antiviral therapy including what holds promise for the future. Once again their conclusion, "a disease which was once viewed as an automatic death warrant, is now in the process of becoming a chronic, potentially long-term treatable illness" certainly supports the premise of this issue. Together these articles clearly demonstrate the scientific basis for the treatment of AIDS and HIV-1 infection as a chronic manageable disease.

Dr. John Johnson, Chief of the Pediatric AIDS Service at the University of Maryland and Dr. Mark Smith, Associate Director of AIDS Services at The Johns Hopkins Hospital elaborate on integrated health care systems. They bring home many points necessary to support *living long and living well.* They especially emphasize the fact that the management of HIV-1 infection belongs in the realm of primary care.

Robert Mehl of the Baltimore City Health Department, a person living with AIDS, asks us to re-examine the physician/patient relationship, which is ever changing in this epidemic.

The Commentary by Dr. Bernie Siegel, a surgeon on the faculty of Yale Medical School, who in his two bestselling books, *Love, Medicine and Miracles* and *Peace, Love and Healing* has challenged all physicians to return to their heritage of optimism and caring, urges us to have all of our patients be "exceptional."

The article by Dr. Charles Steinberg, a family physician and founder of Wellspring in Boulder, Colorado provides an excellent overview of the care of the patient as well as some information on complementary types of therapies patients are seeking, an area about which most of us know very little. This article, the first such published summary, will help us understand some of the therapies most HIV-1 patients are doing on their own, allowing us to at least discuss these issues with them whether or not we agree.

My article presenting a somewhat different view on some of the major questions of this epidemic stimulate some discussion and challenge. Dr. Bartlett's Counterpoint commentary provides an immediate response to this challenge.

Finally, we refer our readers to the Medical and Chirurgical Faculty Position Paper on AIDS published in the January *MMJ* on page 35.

We hope you will be challenged, stimulated, and moved by this series and that you also will become part of making living long and living well *an idea whose time has come.*

Management of Patients with Asymptomatic HIV Infection

John G. Bartlett MD

The author is Chief, Division of Infectious Disease, The Johns Hopkins University School of Medicine.

As much or more is now known about AIDS as about any other infection. Very recent developments permit medical intervention at an early stage when the patient lacks symptoms. Testing should be expanded to detect the newly infected; treatment should begin early when it is thought to be most effective.

First reported in 1981, AIDS subsequently has become recognized as the most important epidemic of the twentieth century. Approximately 10 million persons in the world (including 50,000 citizens of Maryland) are infected with HIV. The intensive scientific study of this disease during the past nine years has resulted in an extraordinary assembly of scientific information; this once-mysterious disease is now well understood in terms of its biology and clinical features. Although there still is much to learn, we now know as much or more about this infection as about any other. Perhaps most important are the very recent developments permiting medical intervention at relatively early stages of the infection when the patient lacks symptoms. One implication is that testing should be expanded to detect at an early stage those who are infected in order to intervene at a time when treatment is thought to be most effective.

Background

Background data for the recommendations include three components: the natural history of HIV infection, predictors of disease progression, and the utility of AZT and other therapeutic interventions.

The natural history of HIV infection has been examined with multiple studies during the past decade, but three have been especially important: One is the San Francisco City Clinic Cohort Study in which banked sera collected sequentially for studies of hepatitis B permitted retrospective analysis for HIV.[1,2] The second major study is the Multicenter AIDS Cohort Study (MACS) that was designed to determine the natural history of HIV infection in over 4,000 gay men in four cities: Pittsburgh, Los Angeles, Chicago, and Baltimore.[3,4] The third is NIH-FDA Red Cross collaborative study of 156 patients who acquired HIV infection from transfusions, thus the specific time of viral acquisition was documented.[5]

Transmission of the virus often is followed by an infectious mononucleosis-like illness at two to six weeks characterized by fever, sore throat, lymphadenopathy, a maculopapular rash,

hepatosplenomegaly, headache, arthralgias, and leukopenia, often with atypical lymphocytes. This illness sometimes is not recognized and, when it is, symptoms usually resolve in one or two weeks. Recovery is followed by seroconversion, which usually takes place at four to twelve weeks after transmission of the virus. Seroconversion is followed by a long period in which the patient feels generally well. Clinical expression of HIV infection in its later stages reflects three types of pathophysiologic mechanisms:

1. Autoimmune or immune complex disease such as idiopathic thrombocytopenia and cotton-wool spots on funduscopic exam.
2. Opportunistic infections or tumors that generally reflect defective T cell-mediated immunity such as *Pneumocystis carinii* pneumonia, thrush, toxoplasmosis, disseminated CMV infection, disseminated *Mycobacterium avium* infection, disseminated herpes simplex, Kaposi's sarcoma, and B cell lymphoma.
3. HIV infection per se that accounts for AIDS-associated dementia, some other neurologic sequelae and, possibly some of the constitutional symptoms such as fever, weight loss, fatigue, night sweats, and chronic diarrhea.

The average time from seroconversion until there is an AIDS-defining diagnosis is estimated at 7 to 10 years, although there is considerable variation in individual patients.[1-5] About 2 percent have an AIDS-defining diagnosis within two years of seroconversion, and many others have remained apparently well as long as they have been followed, which is up to 10 years. Unfortunately, most who remain asymptomatic have laboratory evidence of progressive immunosuppression with a decline in CD-4 cell counts.[2] On the basis of currently available data, the Centers for Disease Control now estimates that the majority of patients with HIV infection eventually will develop AIDS.[6] This observation has important therapeutic implications justifiying a more aggressive attack at early stages of the disease.

Factors accounting for the highly variable course in different individuals in terms of the speed of progression are ill-defined. Many researchers have invoked "co-factors" including nutrition, wellness, psychological stress, and the like as important considerations. Some suggest antigenic stimulation from any source may be important since this promotes proliferation of the CD-4 cells that harbor HIV. Two viruses that specifically promote HIV replication *in vitro* are HTLV I and CMV. HTLV I is found in only a small percentage of IV drug abusers, but CMV is found in up to 90 percent of patients with AIDS.

Predictors of Progressive HIV Infection

Sequential observations in patients with HIV infection permit tabulation of clinical observations and laboratory studies that indicate disease progression with the probability of an AIDS-defining diagnosis in the near future (Table 1). The clinical observations boding an ominous prognosis are thrush, oral hairy leukoplakia, and constitutional symptoms including weight loss, chronic fever, and chronic diarrhea. Herpes zoster may be an early manifestation of HIV infection, but it does not necessarily indicate progressive disease. Peripheral generalized lymphadenopathy (PGL) is commonly found in many or most patients with asymptomatic HIV infection, but this does not appear to indicate disease progression and has no influence on prognosis.[1] An exception is the patient who has very large nodes that may indicate an opportunistic infection, such as MAI, or a lymphoma; another exception is the patient who has rapid resolution of lymph nodes since this generally corresponds to disease progression.

With regard to laboratory tests, many patients who are asymptomatic show the "cytopenias" meaning anemia, leukopenia, lymphopenia, thrombocytopenia, or combinations of these. Some will have very low platelet counts with or without clinical expression in the form of a bleeding diathesis. This usually represents an autoimmune or immune complex complication that generally responds to corticosteroid administration, splenectomy, AZT, or high-dose imunoglobulin therapy.[7] Elevated erythrocyte sedimentation rate, immunoglobulin levels (IgA and IgG), and beta-2 microglobulin are nonspecific indicators that correlate with disease progression. More specific indicators include p24 antigen assays and the lack of antibody to the p24 antigen by Western blot analysis of serum. However, the complete blood count aside, these tests tend to be nonspecific or expensive, or their utility is primarily based on large population-based studies so their use in an individual case may be less decisive.

The best predictor of progressive disease is the CD-4 cell count, the primary target of HIV.[1,2,5-9] Following attachment, the virus enters the cell, it is uncoated, the genome is converted to DNA by the enzyme reverse transcriptase, and viral DNA then integrates into the cellular DNA of the cell nucleus. Replication of HIV results in rupture of the CD-4 cell with the consequence of CD-4 cell depletion and reduced capacity for cell-mediated immunity. Early studies focused atten-

Table 1. Clinical and Laboratory Features of HIV Infection Indicating Disease Progression

	Correlate with Progressive Disease	No Correlation (or Poor Correlation)
Clinical features	Thrush Oral hairy leukoplakia Constitutional symptoms	Idiopathic thrombocytopenia Herpes zoster (?) Peripheral general lymphadenopathy
Laboratory studies	CD-4 count Anemia B2 microglobulin, ESR Anergy p24 antigenemia Immunoglobulins (IgA)	Thrombocytopenia Leukopenia

tion on the ratio of CD-4/CD-8 cells (the helper T cell to suppressor T cell ratio), but many conditions affect the denominator (CD-8 cell) making the ratio less specific. The ratio is also more expensive to obtain. What is important is the absolute CD-4 cell count or the CD-4 percentage since both correlate well with disease progression.

The usual absolute CD-4 cell count in healthy persons is 800-1200/mm^3. Sequential studies in patients with HIV infection indicate a decline that averages approximately 85-100/mm^3 per year. Serious complications seem to occur with predictability when the count reaches 200/mm^3 or the CD-4 percentage in T cell subset analysis is 20 percent.[6,7] In the MACS study, for example, 33 percent of patients with counts of less than 200/mm^3 developed *Pneumocystis carinii* pneumonia within 18 months; by contrast, the frequency of this complication in the same time frame was only 5 percent for those with CD-4 counts exceeding 500/mm^3 (Table 2). It should be noted that, although the average decline is approximately 100 cells/mm^3 per year, individual patients do not show a gradual decline over time. Instead, the CD-4 count declines in fits and starts that are poorly understood but presumably reflect the combined effects of "cofactors" and the replication regulating genes of HIV. This unpredictability in CD-4 cell count patterns accounts for the recommendation by the Centers for Disease Control for analysis of these counts at six-month intervals.[10]

Treatment

AZT is the only drug approved by the FDA for the treatment of HIV infection. This drug is a nucleoside analog that interferes with reverse transcriptase, a necessary step in converting the RNA genome to DNA prior to integration in the host cell nucleus. The efficacy of AZT was demonstrated in a placebo-controlled clinical trial of 282 patients with AIDS or advanced ARC. Analysis of the data in September 1986 showed 19 deaths in placebo recipients compared to only one among those who received AZT.[11] This was heralded as a major advance, but it applied only to patients in relatively late stages of disease.

More recently, there have been two major advances in drug therapy for patients with HIV infection dealing with earlier stages of disease. The first concerns the prevention of pneumocystis pneumonia using either trimethoprim-sulfamethoxazole or aerosolized pentamidine. Pneumocystis pneumonia is clearly the most important complication in patients with HIV infection in that it is the initial AIDS-defining diagnosis in 60 percent of patients, and it is the most frequent identifiable cause of death. The Centers for Disease Control[11] now recommends preventive treatment with trimethoprim-sulfamethoxazole or aerosolized pentamidine for two patient groups:

1. Patients with a prior history of pneumocystis pneumonia since 60 to 70 percent will develop recurrences within one year.
2. Patients with a CD-4 cell count of less than 200/mm^3 based on the MACS study showing that the risk for PCP at 6, 12, and 18 months are 8 percent, 18 percent and 33 percent, respectively.

The most recent major development in therapeutics of HIV infection are the NIH-sponsored studies in a consortium of 35 academic centers known as the AIDS Clinical Trials Groups (ACTG). Two major trials were concluded in August 1989, both dealing with relatively early stages of disease.[12] The first study included 713 patients with early ARC using AZT in a dose of 1,200 mg per day versus placebo. After 3 to 20 months, 50 participants had progressed to advanced ARC or AIDS including 36 in the placebo group and 14 of the AZT recipients (Table 3).

The second study dealt with about 3,200 asymptomatic patients with HIV infection who were randomized to receive either low-dose AZT (500 mg/day), high-dose AZT (1500 mg/day), or placebo. Progression to advanced ARC or AIDS was noted almost exclusively among the 1,300 participants with CD-4 cell counts of less than 500/mm^3 at entry. In this group, progression was significantly reduced with treatment, and there was no difference in protection

Table 2. Cumulative Incidence of *Pneumocystis pneumonia* According to CD-4 cell Count at Baseline in the MACS Seropositive Cohort

CD-4 count at baseline	Number	No. with PCP(%)	Percentage with PCP 6 mo.	12 mo.	18 mo.
≤ 200	77	19 (25)	8	18	33

* Progression to AIDS or advanced ARC.
** Significant difference compared to treatment group (p 0.05).

afforded by the high-dose versus the low-dose. The findings of these studies indicate that progression can be delayed with early treatment using relatively low doses of AZT. Notable advantages of the low dose are the reduced expense (wholesale annual price in November 1989 of $2,190 for the 500 mg daily regimen compared to $4,812 for the 1200 mg/day) and toxicity rates that were virtually nil in the low-dose group.

Patient Evaluation

The data summarized above provide guidelines for patient management. In general, asymptomatic HIV-infected patients require counseling, psychological support, regular medical assessment with appropriate use of vaccines, and interventions with AZT and pneumocystis prophylaxis using CD-4 counts as the major criteria.

All patients who are seropositive must have appropriate counseling to insure they understand the medical and social implications of a positive test, methods to prevent transmission to others, the need to notify persons who have been or will be placed at risk, the implications for pregnancy, and resources that are available for psychological support and medical care. This may not be easy to accomplish in a single session since many patients are so overwhelmed at the time they are first notified that little of the rest of the message is processed. Thus, we often arrange for a follow-up visit within one or two weeks to make sure that the patient understands and is proceeding accordingly. It is ill-advised to notify the patient by any means other than person-to-person contact. These are responsibilities incurred by anyone who performs this test, and all who have participated in this type of notification are aware of the potential for morbid consequences.

Medical assessment The purposes of the medical evaluation are to stage the disease and to provide timely intervention.

The most common initial features of symptomatic disease include thrush, pneumocystis pneumonia, Kaposi's sarcoma, and constitutional complaints such as fever, weight loss, intermittent diarrhea, and fatigue. Kaposi's sarcoma usually presents as nodular lesions with a purplish discoloration in light-skinned persons and black in dark-skinned individuals. Pneumocystis pneumonia in these patients often has an indolent course characterized by fever, nonproductive cough, and dyspnea that frequently extends over several weeks prior to medical presentation. AIDS dementia complex is a relatively common complication in the late stages of this infection, but it is an infrequent finding early in the course. None of these complications occur commonly before the CD-4 cell count is 200 or less. An important exception is tuberculosis, which tends to occur relatively early, presumably reflecting its virulence potential compared to other opportunistic pathogens.

The physical examination should specifically address anatomical sites that are commonly involved. The check list includes the oral cavity (thrush, herpes, aphthous ulcers, oral hairy leukoplakia, and Kaposi's sarcoma), funduscopic exam (cotton wool spots, CMV retinitis), lungs (pneumocystis pneumonia), abdomen (hepatosplenomegaly), lymph nodes (primarily the cervical and axillary nodes), genital exam (for sexually transmitted diseases), skin (Kaposi's sarcoma, seborrhea, molluscum, eosinophilic folliculitis), and neuropsychological exam (AIDS dementia complex, toxoplasmosis, cryptococcal meningitis, and peripheral neuropathies).

Laboratory studies The suggested routine laboratory screening tests for asymptomatic patients include a complete blood count with differential and platelets, SMA-12, syphilis serology, and a CD-4 lymphocyte count. All patients also should have a PPD (intermediate strength) unless there is a history of a previously reactive test. Other laboratory studies that may be useful on occasions include a chest x-ray, sedimentation rate, hepatitis serology, and beta-2 microglobulin levels. Tests that are occasionally advocated (but we believe are infrequently helpful) include quantitative immunoglobulins, anergy screen, p24 antigen assay, p24 antibody assay, viral culture, and CD-4/CD-8 lymphocyte subset ratio.

Medical Interventions

An important recent change in the guidelines for management of HIV infection in asymptomatic patients concerns antiviral therapy and prophylaxis directed against anticipated opportunistic pathogens.

Vaccines All patients with HIV infection are now included in the CDC guidelines for influenza vaccine and pneumococcal vaccine. The influenza vaccine should be given annually, although patients with HIV infection are not known to be uniquely susceptible to influenza in terms of frequency or severity of infection. Pneumococcal vaccine should be given once, preferably in the early stages of infection when there is a relatively good antigenic response to a polysaccharide vaccine. Prior studies have well documented that the frequency of pneumococcal infections is magnified 20 to 40-fold in patients with HIV infection and, although patients with AIDS have an attenuated antigenic response to this vaccine, those who are asymptomatic respond well.[13]

Tuberculosis prophylaxis All patients with a positive PPD (> 5 mm induration) should receive isonazide in a dose of 300 mg per day for at least 12 months. HIV infection is now recognized as the highest risk category for activation of latent disease. Reports from New York City, Florida, and Connecticut indicate 5 to 10 percent of all AIDS patients have active tuberculosis, and most have this as their first opportunistic infection.[14]

Prophylaxis directed against pneumocystis pneumonia This is recommended for any patient with a history of pneumocystis pneumonia and any patient who has a CD-4 cell count of less than 200/mm^3. The two regimens recommended by the CDC[1] are either of the following:

1. Oral trimethoprim-sulfamethoxazole (TMP-SMX), one double-strength tablet given twice daily with 5 mg leucovorin once daily.
2. Aerosolized pentamidine given in a 300 mg

dose every four weeks using a Respigard II jet nebulizer.

The relative merits of these two prophylaxis strategies are unknown. Potential advantages of the oral TMP-SMX regimen are the facts that it may also prevent a multitude of other infections, it is less expensive, and it is certainly more convenient. A potential disadvantage is the high frequency of adverse reactions encountered in HIV-infected patients receiving sulfonamides. A potential advantage of aerosolized pentamidine is the rarity of adverse reactions. Neither treatment should be given to pregnant women. Other regimens to prevent pneumocystis pneumonia do not have the advantage of established efficacy with a clinical trial. Theoretically they should work.[15]

AZT treatment The studies cited above demonstrated convincing benefit for the use of AZT early in the course of HIV infection by preventing progression to advanced ARC or AIDS. Virtually no patients who had CD-4 counts exceeding 500 progressed to these endpoints within the 20 month study period so the potential utility of AZT could not be evaluated. On the basis of observations summarized in Table 3, it is now recommended that AZT be given to any patient with HIV infection and a CD-4 cell count in the range of 200 to 500/mm^3. Patients should be given 100 mg five times daily; the usual regimen is one tablet every four hours while awake. The rationale for the lower dose is based on the previously cited studies showing comparable efficacy and reduced toxicity for the lower dose compared to the previously recommended dose of 1000 to 1200 mg/day.

However, at the time of this writing, the details of these studies have not been published, nor has the FDA reviewed the data to make a recommendation. Furthermore, the annual rate of progression to PCP for those with CD-4 counts of 350-500/mm^3 is only about 2 percent so that efficacy within this strata needs scrutiny, and a delay of weeks or months may have no consequences.

It is clear from conversations with other providers that there is no unanimity on this issue. Some of the arguments favoring status quo (utilization of the prior FDA guidelines) include the following:

- Some physicians may prefer to await an NIH consensus statement expected soon, since this will be formulated by authorities who have access to all the data and/or publication of this material in the medical literature, or FDA review.
- The cut-off point of 500 CD-4 cells was an arbitrary strata defined prior to the NIH study. The specific CD-4 count at which there is a demonstrable benefit from AZT may be substantitally lower, and such information may become available only with further analysis of data. Thus, it is possible that significant benefit is noted only when the CD-4 count is below 350 mm^3.
- The advocacy of AZT for CD-4 counts of less than 500 has enormous economic consequences since this appears to apply to approximately 40 percent of all HIV- infected patients.
- It is possible that viral resistance is an inevitable consequence of AZT therapy, and that early use of the drug negates efficacy in later stages of disease.
- Two other pacebo-controlled studies in asymptomatic HIV infected patients apparently have not demonstrated similar benefit. These include a study in England (the Concorde 1) and a Veterans Administration Hospital cooperative study (VA study #298). Results with interim analysis of these studies are not yet available for publication, although both studies are continuing, suggesting that significant benefit has not been demonstrated.

The dosage recommendation is unclear for patients who have AIDS or symptomatic disease and a CD-4 cell count of less than 200/mm^3, and those who are receiving this drug under the previous FDA guidelines. Another NIH study demonstrated the lower dose seems to be equally effective in patients with this more advanced stage of disease.[12] One problem with lower dose AZT concerns the central nervous system (CNS) manifestations of HIV infection. Most patients have evidence of CNS involvement relatively early in the course when they are still asymptomatic, although AIDS dementia complex is a common feature only in the late stages of disease. AZT penetrates the blood-brain barrier reasonably well, but evidence that the drug delays or reverses CNS complications is limited and it is possible that the higher dose is more effective. On the basis of these observations, we are reluctant to make a strong recommendation regarding the dose of AZT for patients with more advanced disease until we have seen all of the available data.

Patients receiving AZT must be followed carefully for the hematologic toxicity, primarily anemia or neutropenia. The original AZT controlled trial with treatment up to seven months showed 30 percent of AZT recipients with CD-4 counts $< 200/mm^3$ developed anemia with a hemoglobin below 7.5 gm/dL and approximately half required transfusions; 47 percent developed granulocytopenia with leukocyte counts below 750/dL.[10] The current recommendation is for a complete blood count every two to four weeks and monitoring of liver function tests every month. Hematologic toxicity is related to the dose and duration of therapy, to the stage of disease when treatment is initiated and to the pretreatment CBC values. The previously cited trial using 500 mg/day in asymptomatic patients showed virtually no hematologic toxicity; on the basis of this observation, we recommend a complete blood count at monthly intervals with the possibility that this frequency can be further extended as more experience is accumulated.

Patient Monitoring and Costs

The intensity of work, frequency of visits, and resour-

ces necessary for ambulatory care of HIV-infected patients will vary with the stage of disease, which is largely governed by concurrent medical conditions, psychiatric needs, symptoms ascribed to HIV, and CD-4 cell counts. For most patients without compounding issues of psychiatric support or unrelated medical problems, the schema in Table 4 is suggested.

The cost of care will vary according to services provided, medications given, and laboratory tests used. A recent assessment of the costs of ambulatory care for HIV infected patients employed a two-phase model.[16] The first phase was for the patient who received counseling and monitoring without drug therapy, and the second phase was for these services combined with antiretroviral treatment using AZT and pneumocystis prophylaxis. The estimated cost for the first phase was $854/year and for the second was $9,637/year. Although the cost of AZT was somewhat inflated in this analysis ($4,021 to $8,042/yr), it does demonstrate the important economic consequences of new therapeutic strategies.

The screening tests advocated previously will total about $80 to $100. (This is exclusive of HIV serology, which is free at county health departments and $30 to $180 at commercial laboratories in Maryland.) In reference to stages of HIV infection tabulated in Table 4, we estimate approximate annual charges for care for otherwise uncomplicated patients with HIV in stage 1 (CD-4 count $> 500/mm^3$) to be $220 to $280 including laboratory tests ($100 to $150) and two office visits at $60/visit. For stage 2 disease (CD-4 count 200-500/mm^3) the cost will approximate $3,300 to $4,600 based on costs for AZT at $2,600 to $3,200 (based on dose of 500 mg/day at $2,190/yr wholesale price), laboratory charges of $500 to $800, and 4 to 12 office visits at $60/visit. For stage 3a (CD-4 count $< 200/mm^3$, asymptomatic), the costs increase $600 to $2,000/year for pneumocystis prophylaxis. In the late stages of disease, the intensity of medical care increases logarithmically, and costs for care escalate accordingly.

Table 4. Suggested Schema for Medical Care of Patients with HIV Infection

Stage	Clinic Visits	Services
1. CD-4 count $> 500/mm^3$	Every 6 months	Medical assessment and CD-4 cell count; psychological support may require more frequent visits or separate arrangements.
2. CD-4 count 200-500/mm^3	Every month for CBC; every 1-3 months for medical assessment	AZT administration with CBC monthly; CD-4 cell count every 3-6 months; it may be appropriate to actually see the patient at 3 month intervals if clinically stable; AZT hematologic toxicity unlikely.
3. CD-4 count $< 200/mm^3$		
a. Asymptomatic	Every month	AZT administration and PCP prophylaxis; frequency of medical assessment varies with symptomatology.
b. Symptomatic	Every week -month	Frequency of visits based on clinical needs.

Summary

There has been extensive progress in the management of HIV infection. This especially applies to patients in the early asymptomatic stages of disease. Management guidelines include counseling of all seropositive patients, medical evaluation, psychological support, and medical intervention. For the asymptomatic patient, important strategies currently recommended include a CD-4 cell count at six month intervals with the use of AZT for those patients with counts of less than 500/mm^3 and the use of *Pneumocystis carinii* prophylaxis in those with CD-4 counts of less than 200/mm^3. It is likely these recommendations will change in the near future due to the rapid evolution of developments in this field. Most promising are a variety of new antiviral agents and additional measures to prevent superimposed opportunistic infections.

Prevention of Opportunistic Infections in Patients with HIV

Richard E. Chaisson MD

The author is an Assistant Professor of Medicine, Epidemiology and International Health, The Johns Hopkins University; and Director, AIDS Service, The Johns Hopkins Hospital.

Improvements in antiretroviral therapy and prevention of opportunistic infections have significantly prolonged survival of patients with advanced HIV disease. Physicians caring for patients with HIV infection should adopt aggressive and early measures to prevent (not just treat) HIV-related opportunistic disease.

Infection with Human Immunodeficiency Virus (HIV) may result in symptomatic illness in the majority of infected individuals in the absence of therapy.[1] Opportunistic infections and malignancies are the clinical hallmarks that distinguish the various stages of HIV disease in infected persons. With advances in understanding the natural history of HIV infection,[1-3] it is now possible to predict the likelihood that an infected individual will develop opportunistic infections. Persons with CD-4+ lymphocyte counts below 200/mm^3, with a history of oral candidiasis or oral hairy leukoplakia, with constitutional symptoms, or who have had any prior opportunistic infection are at extremely high risk of developing an opportunistic infection, particularly *Pneumocystis carinii* pneumonia (PCP) in the subsequent 12 to 18 months. Thus, preventive therapy, in addition to antiretroviral treatment, can now be directed toward selected individuals with HIV infection to decrease the morbidity and mortality of HIV-associated immunosuppression.

Pneumocystis Carinii

P. carinii pneumonia is the most common AIDS-related opportunistic infection, occurring as the initial AIDS-defining infection in 60 percent of AIDS cases in the United States. It has been estimated that ultimately 80 percent of persons with AIDS in the US will develop PCP. Studies performed in San Francisco have helped delineate the impact of PCP on survival. Early in the AIDS epidemic, the mortality of first episodes of PCP was 20 to 30 percent and the mortality of subsequent episodes was approximately 45 percent. The median survival after a first episode of PCP prior to 1985 was 10 months.[4] Recently, however, survival following an episode of PCP has increased significantly, to a median survival of 18 months for persons diagnosed in 1987. The improving survival of persons with PCP is attributed to the advent of antiretroviral therapy and to prophylaxis for PCP.[5]

Prophylaxis for PCP is indicated in selected patients with HIV

infection. Prospective studies of HIV seropositive persons have demonstrated an increasing likelihood of PCP with declining levels of CD-4+ T lymphocytes. Data from the Multicenter AIDS Cohort Study (MACS) show that in HIV seropositive gay men with a CD-4+ count < 200 cells/mm^3, the one-year risk of PCP is 18 percent.[6] Approximately one-third of persons with < 200 CD-4+ cells/mm3 develop PCP within three years. The risk for progressing from HIV infection to PCP is increased by the presence of oral candidiasis, weight loss, fever, or other constitutional symptoms. The US Public Health Service recommends that any HIV seropositive person with < 200 CD-4+ cells/mm^3 receive propylaxis for PCP.[7]

Persons with AIDS-related Kaposi's sarcoma (KS) are also at increased risk of PCP. The risk of PCP in patients with KS is also greatly influenced by CD-4+ cell counts. Recently it has been noted that patients with an index AIDS diagnosis of KS have a shortened survival compared to KS patients diagnosed earlier in the AIDS epidemic.[4] This change in survival is primarily the result of lower CD-4+ counts and increased rates of progression to PCP and other AIDS-related opportunistic infections among patients diagnosed more recently. Finally, an increased risk of PCP is associated with other AIDS-related opportunistic diseases, such as cryptococcal infection, toxoplasmosis, candida esophagitis, and non-Hodgkin's lymphomas. Consequently, prophylaxis against PCP is recommended for all of the patient groups enumerated above.

PCP prophylaxis has been studied in populations other than HIV-infected persons, particularly in children with hematologic malignancies. Trimethoprim-sulfamethoxazole (TMP-SMX) has been shown effective in controlled clinical trials for preventing PCP in patients with hematologic malignancies in doses of 5 mg TMP/kg/day given daily or three days weekly.[8,9] Studies of PCP prophylaxis in patients with HIV infection have been less well organized and controlled. Fischl *et al.* studied TMP-SMX for PCP prophylaxis in patients with HIV-related Kaposi's sarcoma.[10] Patients were alternately assigned to TMP-SMX 160 mg/800 mg b.i.d. and leukovorin 5 mg/day or to no treatment. There were no cases of PCP in 30 subjects assigned to TMP-SMX while on treatment compared to 16 cases in the 30 patients not treated. Survival was significantly prolonged for patients able to tolerate therapy with TMP-SMX. If treatment was discontinued, however, the risk of PCP increased, with cases occurring in four of five patients discontinuing prophylaxis. Overall, 50 percent of patients assigned to TMP-SMX developed adverse reactions, 17 percent of which required discontinuation of treatment.

In a placebo-controlled trial of TMP-SMX for prevention of PCP in patients with HIV-related Kaposi's sarcoma, Kaplan and coworkers found no benefit of therapy because of a high rate of patient dropout; 12/14 patients randomized to TMP-SMX developed adverse reactions requiring discontinuation of drug.[11] This study did not use folinic acid in the active study arm. It is not known whether coadministration of folinic acid with TMP-SMX will reduce the incidence of adverse reactions. However, the primary toxicity of TMP-SMX in prophylaxis protocols is cutaneous eruptions. There is no evidence that folinic acid would reduce the likelihood of a dermatologic reaction to TMP-SMX.

Pentamidine isoethionate is an active agent against *P. carinii* and effective in primary therapy for active PCP. Prophylaxis with parenteral pentamidine was found to have apparent benefit in uncontrolled trials in patients with a history of an episode of PCP. Recent studies have focused on the use of aerosolized pentamidine to prevent PCP. Previous clinical and pathologic experience has shown that PCP is primarily an intra-alveolar process, with little tissue invasion and a very low rate of dissemination. Studies in immunocompromised mice and rats have demonstrated that aerosolized pentamidine effectively targets the lungs and cures PCP. A pilot study in humans with AIDS-related PCP showed efficacy of treatment with 600 mg/day aerosolized pentamidine via a Respirgard II nebulizer in treating the acute pneumonia.[12] On the basis of preliminary data from humans, prospective studies of aerosolized pentamidine prophylaxis have been conducted.

The most intensive and rigorous study of aerosolized pentamidine was carried out by the San Francisco County Community Consortium, a private organization of physicians treating AIDS and HIV patients in the San Francisco Bay area.[13] In this investigation, 408 patients with HIV infection (237 with a history of PCP) were randomized to receive aerosolized pentamidine via a Respigard II nebulizer at either 30 mg biweekly, 150 mg biweekly, or 300 mg monthly. At 18 months of follow-up the patients randomized to 300 mg monthly had significantly fewer episodes of PCP and had marginally improved survival. The efficacy of the higher dose, monthly prophylaxis was seen in all strata of patients, including those without prior episodes of PCP. Other nonconcurrent studies of aerosolized pentamidine at lower doses showed decreased relapse rates of PCP when compared to historical controls.[14] One uncontrolled study reported that patients on low-dose aerosol pentamidine who experienced relapses tended to have upper lobe disease, suggesting a dose-response effect within the lungs.[15] Recently, Girard and coworkers in Paris randomized AIDS patients who had had an episode of PCP to receive either zidovudine and nebulized pentamidine mesylate 4 mg/kg biweekly for one month then monthly or zidovudine alone.[16] The patients receiving aerosol pentamidine had a 85 percent decreased risk of a recurrence of PCP during 9 to 10 months of follow-up.

Use of aerosol pentamidine prophylaxis has been associated with several complications. Toxicity from aerosol pentamidine includes cough, wheezing, short-

ness of breath and bronchitis. Long-term changes in pulmonary function have not been demonstrated in patients on aerosol pentamidine. Systemic effects of aerosol pentamidine are unusual, but hypoglycemia, pancreatitis, neutropenia, and renal insufficiency have been noted in some patients receiving pentamidine by aerosol.

Extrapulmonary pneumocystosis has been reported in some patients on aerosol pentamidine in the absence of pulmonary disease.[17,18] This suggests that pentamidine levels are inadequate to prevent dissemination after aerosol administration. However, the incidence of disseminated pneumocystosis appears to be very low. In 150 patients receiving aerosol pentamidine at The Johns Hopkins Hospital HIV clinic for an average of more than 10 months there have been only three cases of extrapulmonary *P. carinii* infection. In the San Francisco Community Consortium study no cases of disseminated disease were reported in 18 months.

The Food and Drug Administration has licensed aerosol pentamidine for prevention of PCP in patients with HIV infection and < 200 CD-4+ cells/mm^3 or with a history of PCP. The recommended dose is 300 mg given by Respigard II nebulizer every four weeks. Alternative doses and delivery devices are under study by a number of investigators.

Other agents for the prevention of PCP have been less well studied in patients with HIV infection, but may play a role. Dapsone has been used at doses of 50-100 mg/day in uncontrolled studies and may be effective in preventing PCP.[19] Side effects include anemia, methemoglobinemia, rash, and in patients who are G-6-PD deficient, hemolysis. Pyrimethamine-sulfadoxine (Fansidar) given weekly also has been used in several series.[20] While this appears to be well tolerated and probably effective, Fansidar has been associated with fatal Stevens-Johnson syndrome in other patient groups and is not widely accepted by physicians. The long half-life of sulfadoxine is problematic when adverse reactions develop. Other potentially useful agents for preventing PCP include pyrimethamine alone, primaquine and clindamycin, trimetrexate, and eflornithine. No clinical trials of these agents for prophylaxis have been reported.

The Table shows the drugs and doses used for PCP and other prophylaxis in patients with HIV disease. Patients who can tolerate TMP-SMX should be treated with one DS tablet b.i.d. Patients unable to tolerate this should receive aerosol pentamidine 300 mg every four weeks. Alternatives can be substituted when neither TMP-SMX nor aerosol pentamidine is tolerated or feasible.

Mycobacteria

Disease caused by both typical and atypical mycobacteria are also common in patients with HIV infection. Unlike atypical mycobacterioses, however, tuberculosis in patients with HIV infection is treatable and preventable. Numerous studies have shown a strong association between tuberculosis and HIV. Case rates of tuberculosis in the United States stopped declining in 1985, and it is estimated that more than 15,000 excess cases of tuberculosis have occurred as a result of the HIV epidemic in the past five years.[21,22] Tuberculosis in HIV seropositive patients usually represents reactivation of remote infection with *Mycobacteruim tuberculosis*. Selwyn *et al.* studied IV drug users with positive tuberculin skin tests and found that 14 percent of HIV seropositive developed tuberculosis within two years, versus none of HIV seronegative subjects.[23] Detection of *M. tuberculosis* infection and institution of preventive chemotherapy, therefore, make tuberculosis a preventable disease in persons coinfected with it and HIV. Anergy to skin tests is common in persons with HIV infection and may impair the diagnosis of tuberculous infection. In patients with AIDS and tuberculosis, only up to 40 percent of patients have a significant reaction to PPD.[22] However, in HIV seropositive persons with tuberculosis who do not have other clinical manifestations of HIV disease, up to 80 percent may respond to PPD.[22] Thus, early detection of tuberculous infection with tuberculin skin testing is a feasible strategy for preventing tuberculosis in HIV seropositive persons.

Risk of coinfection with *M. tuberculosis* in HIV-infected persons is greatest in IV drug users, persons from countries where tuberculosis is endemic, prisoners, and members of ethnic minorities with a high prevalence of tuberculosis. Screening of newly diagnosed HIV seropositive patients should be performed with five tuberculin units of PPD, read 48 to 72 hours following injection. Induration ≥ 5 mm should be considered a positive reaction.

Preventive therapy for tuberculosis is recommended for all persons (regardless of whether they are documented converters) with HIV infection and a positive

Table.

Organisms	Therapy	Target Population
P. carinii	TMP-SMX DS BID Aerosol Pentamidine 300mg q 4 wks	< 200 CD-4+ cells Prior PCP Kaposi's sarcoma Other AIDS Dx
M. tuberculosis	INH 300 mg/day, 12 mos	HIV+, PPD+ or TB exposure
Strep. pneumoniae	Pneumococcal polysacharride vaccine TMP-SMX DS BID Penicillin VK 1 g/day	HIV+ adults PCP prophylaxis Prior pneumonia or or bacteremia
H. influenzae	*H. influenzae* type b polysacharride vaccine Ampicillin 1 g/day Cephradine 1 g/day	HIV+ children Prior serious infection
Herpes Simplex virus-2	Acyclovir 200-400 mg TID	Recurrent or complicated HSV
Cytomegalovirus	? Acyclovir 800 mg 5x/day	HIV+, CMV+ (experimental)

PPD regardless of age. The Centers for Disease Control and the American Thoracic Society recommend that such individuals receive isoniazid 10 mg/kg/day up to 300 mg/day for 12 months.[24] Clinical trials assessing the efficacy of this regimen have not been performed in HIV-infected populations. Studies in nonimmunocompromised populations with tuberculous infection have shown that six months of isoniazid propylaxis is as effective but less toxic than 12 months' treatment. However, because HIV infection is associated with progressive loss of cellular immunocompetence, some authorities argue that lifelong chemoprophylaxis is needed to prevent tuberculosis. Several trials are under way to address this issue. Alternatives to isoniazid, such as rifampin, are more expensive, potentially more toxic, and untested in any patient population.

Atypical mycobacterioses are usually late complications of HIV disease that result in morbidity but not mortality.[25,26] Treatment of *Mycobacterium avium* complex (MAC) infections is, at best, marginally effective. Prevention of MAC infections is desirable but not practical with current knowledge. Several clinical trials are presently being organized to assess the efficacy of chemoprophylaxis of MAC infection in patients with AIDS.

Bacteria

Bacterial infections are associated with B-cell defects in HIV seropositive persons.[27] Infections caused by encapsulated bacteria, particularly *Streptococcus pneumoniae* and *Haemophilus influenzae*, are commonly encountered. The incidence of bacterial infections appears to be greater in children, IV drug users, and persons from developing countries with HIV infection.[27,28] Enteric bacterial infections are more common in homosexual men and in residents of developing countries.

Preventive strategies for bacterial infections can be divided into three categories: hygienic measures, immunotherapy, and chemoprophylaxis. Hygienic measures include avoidance of potential sources of bacterial innoculation, such as impure food and water, contaminated animals, and oral fecal sexual contact. Moreover, cessation of cigarette smoking, while not technically speaking a hygienic measure, may reduce the risk of bacterial pulmonary infections.

Immunotherapy to prevent bacterial infections in persons with HIV infection includes passive and active immunization. Administration of IgG is recommended for all children with HIV infection. Suppression of B-cell response and proliferation to de novo antigen challenge places children at particular risk of bacterial diseases. Adults with HIV infection are at lower risk, presumably because of previous exposure to potentially pathogenic bacteria resulting in circulating antibodies that render some protection. Consequently, IgG is not recommended for HIV seropositive adults.

Active immunotherapy is potentially available for two important bacterial pathogens, *S. pneumoniae* and *H. influenzae* type b. Licensed vaccines for both pathogens are currently available. A recent study at The Johns Hopkins Hospital showed that 12/13 bacteremic pneumococcal infections in patients with HIV infection were caused by serotypes contained in the 23-valent pneumoccocal polysacharride vaccine.[29] Pneumococcal vaccine is recommended by the Advisory Committee on Immunization Practices for all HIV seropositive adults.[30] Several studies of pneumococcal vaccine in patients with HIV infection, however, suggest that response is impaired, particularly in patients with low CD-4+ lymphocyte counts.[31] Efficacy studies of pneumococcal vaccine have not been conducted in HIV-infected persons. Use of pneumococcal vaccine is probably most rational early in the course of HIV infection, when immunocompetence is relatively intact.

Antibiotic prophylaxis for bacterial infections in HIV patients may be appropriate in several settings. Patients receiving TMP-SMX as PCP prophylaxis also will be protected from infections due to encapsulated bacteria. Preventive chemotherapy specifically for bacterial pathogens is recommended for children with HIV infection. Secondary prophylaxis to prevent recurrent bacterial infections is indicated in patients who have experienced serious bacterial disease. Relapse rates for *H. influenzae* and *S. pneumoniae* range from 20 to 50 percent without prophylaxis. Patients who have had serious pneumococcal infections can be treated with penicillin V-K, 1 g/day or erythromycin .5-1 g/day to prevent recurrences. Patients who have experienced serious infections due to *H. influenzae* can be given ampicillin, amoxacillin, a first-generation cephalosporin, or rotating cycles of these agents for prophylaxis. The efficacy and toxicity of preventing bacterial infections in patients with HIV disease has not been studied in clinical trials.

Herpesviruses

Infections caused by reactivation of herpesviruses are extremely common in patients with HIV disease and can range from minor annoyances to life-threatening complications of AIDS.[32] Recurrent and chronic mucocutaneous Herpes simplex virus-2 infections constitute an AIDS-defining diagnosis and may occur in up to 20 percent of AIDS patients. Acute treatment with acyclovir 200 mg five times daily is generally effective in promoting healing of lesions and reduction of symptoms. As recurrences are common, preventive (suppressive) therapy with acyclovir 200-400 mg three to four times daily often is indicated. Patients who experience three or more outbreaks in a six-month period, or who have complications from HSV-2 infections, should receive prophylaxis.

Cytomegalovirus (CMV) infection is present in more than 90 percent of persons with sexually acquired HIV infection but causes disease (retinitis, enteritis,

pneumonitis, etc.) in only 10 to 20 percent of AIDS patients. Treatment of CMV disease is complicated and requires long-term administration of the relatively toxic agent ganciclovir. Consequently, prevention of CMV disease is desirable. While achievable serum concentrations of acyclovir are inadequate to treat acute CMV disease, high doses of the drug may be able to suppress reactivation of latent CMV infection. In renal transplant recipients, prophylactic administration of oral acyclovir 800-3200 mg/day significantly reduced the incidence of subsequent CMV disease compared to placebo-treated controls.[33] Clinical trials of preventing CMV disease in patients with HIV infection are under way. At present, routine use of acyclovir or ganciclovir for the prevention of CMV disease is not recommended for patients with HIV infection or AIDS.

Conclusions

Improvements in antiretroviral therapy and prevention of opportunistic infections have significantly prolonged survival of patients with advanced HIV disease. In particular, prevention of PCP appears to have had a dramatic impact on the quality and quantity of life for people with HIV. Physicians caring for patients with HIV infection should adopt aggressive and early measures to prevent, and not just treat, HIV-related opportunistic disease. Prophylaxis for PCP, tuberculosis, and pneumococcal infections is feasible and should be employed in selected patients. Additional studies of preventive therapy for other AIDS-related infections are urgently needed.

MORE THAN **250,000** PATIENTS HAVE ENJOYED HEALTH BENEFITS RESULTING FROM MEDIFAST.

MORE THAN **10,000** PHYSICIANS PRESCRIBE MEDIFAST WITH CONFIDENCE.

MORE THAN **10** YEARS OF DEDICATED SERVICE TO THE MEDICAL PROFESSION.

No Other Physician-Supervised Weight Control Program Delivers This Winning Combination ...and that makes Medifast #1

Physician-Supervised Protein-Sparing Modified Fast For the Safe • Rapid • Medical Treatment of Obesity

Doctor, one of every four of your patients has overweight problems that need medical help...the help of Medifast®.

A comprehensive program for rapid weight loss *and lifelong weight control,* Medifast has proven itself. For more than 10 years! To more than 10,000 physicians! To more than 250,000 patients!

TRAINING MANUALS

Medifast will work for you, too.

Patients lose weight with a program of physician-supervised modified fasting and behavior modification. And they keep it off with our exclusive *LifeStyles* Program.

The Medifast Program includes:

★*Training* – Comprehensive training manuals written by physicians, for physicians. Address all clinical and administrative aspects.

★*Medifast Supplements* – Extremely high quality. Medically formulated. Nutritionally complete.

★*LifeStyles* – The Medifast Program of Patient Support™. Teaches patients the way to long-term weight control and healthful living.

★*Clinical Consultation* – Medical and technical support specialists available daily at our toll-free number.

★*Practice Promotion Portfolio* – Complete with marketing ideas, office displays, posters, waiting room brochures, and advertising.

★*National Consumer Ad Campaign* – Builds public awareness, creates referrals.

LifeStyles; PATIENT SUPPORT

You know, Doctor, that more traditional methods of weight reduction are simply ineffective. And, severe overweight threatens your patient's health. Primary Care Physicians of every specialty recognize Medifast to be an important addition to their prescribed therapy and an effective way to increase their patient base.

The Role of Antiretroviral Therapy in Living Long and Living Well

John J. Zurlo MD and H. Clifford Lane MD

From the National Institute of Allergy and Infectious Diseases, Bethesda.

The dramatic increase in types of antiviral strategies and numbers of specific antiviral agents emerging since the early 1980s have changed the prognosis of HIV infection. A disease once viewed as an automatic death warrant is now in the process of becoming a chronic, potentially long-term treatable illness.

During the early years of the AIDS epidemic even after the causative agent of the disease, the human immunodeficiency virus (HIV-1) was first identified, the syndrome was thought to be almost universally fatal. With the release of encouraging data from the first successful clinical trial of an antiretroviral agent, AZT (Zidovudine) in 1986, it soon became apparent that there was a potential for controlling HIV infection and consequently delaying immunologic deterioration for some period of time. During the last few years there has been an explosion of research into new antiretroviral agents and strategies for containment of the virus. The more we have learned, the more our concepts about the pathogenesis and prognosis of this infection have changed. We summarize recent clinical data and describe a practical framework for understanding the use of and controversies surrounding antiretroviral therapy in the 1990s.

Zidovudine

Zidovudine (3'-azido-2',3'-dideoxythymidine) is a dideoxynucleoside analogue first developed as an antitumor drug in the early 1960s. During the early part of the AIDS epidemic, this agent as well as a number of others like it were tested and found to have antiretroviral activity, *in vitro*, and were thus considered candidates for *in vivo* testing.

Like all other members of this class of molecules studied, zidovudine acts to inhibit reverse transcriptase (RNA-dependent, DNA-polymerase), a key enzyme in the viral replication cycle. By competing with thymidine, zidovudine is incorporated into the elongating viral DNA polymer resulting in termination of the DNA chain since no other nucleosides can bind to the 3'-azido position on the molecule. As a result, incomplete copies of the viral genome are produced that cannot be incorporated into the host-cell genome. Without incorporation, the virus cannot replicate. The inhibitory effects of zidovudine are not specific for the viral polymerase, and some host-cell polymerases also are inhibited. This inhibition of host-cell enzymes may underlie one or more of the well-recognized toxicities attributed to this drug (see below).

To understand the rationale behind the potential indications and dosage recommendations for zidovudine, a few key pharmacokinetic facts must be considered. After oral administration, a little over 60 percent of the drug is absorbed, and the peak plasma level is reached somewhere between 30 and 90 minutes later. Though the plasma half life ($T_{1/2}$) of zidovudine is 1.1 hours, the intracellular half life is 3 hours, which may be an important factor in designing the optimal frequency of administration. Zidovudine penetrates the blood brain barrier and achieves CSF levels that are approximately 60 percent of the peak plasma level.

The drug is eliminated by the liver, following hepatic glucuronidation to form an apparently inactive product, and by renal excretion. Probenecid has been shown to retard both steps in the clearance process and thereby prolongs the plasma half life of zidovudine. Clinical trials employing the combination of probenecid and zidovudine are ongoing and may well conclude that concomitant administration of both agents will allow for less frequent dosing of zidovudine.

Clinical Experience (Table 1)

The first randomized controlled trial of zidovudine (begun in March 1986) included HIV-infected patients with advanced immunodeficiency manifested by previous *Pneumocystis carinii* pneumonia (PCP) or severe AIDS-related complex (ARC). The study was double blinded and patients were randomized to receive either zidovudine or placebo. When in September 1986 it was discovered that 19 of the 20 patients on protocol who had died were in the placebo arm, the trial was terminated and all patients in the control group were placed on zidovudine. In addition to demonstrating a higher probability of survival, patients on the treatment arm also experienced fewer opportunistic infections while receiving the drug. Based primarily on this study, zidovudine was approved by the Food and Drug Administration (FDA) for the management of HIV-infected patients with AIDS or ARC with a history of PCP or an absolute helper/inducer (CD-4+, T4+) T cell count of < 200 cells/mm^3.

Long-term followup of the original patient group confirmed that zidovudine acts to *delay*, not prevent the progression of HIV disease. A twelve-month followup of this cohort, most of whom were maintained on zidovudine, revealed an overall mortality of 10.3 percent. Although considerably better than the expected 55 percent mortality in untreated patients, these data demonstrate the incomplete nature of zidovudine's antiretroviral activity.

Table 1. Clinical Usees of Zidovudine

Clinical Situation	Zidovudine Beneficial
CD-4 count < 200	Yes
AIDS dementia complex	Yes
CD-4 200 - 500	Probably
CD-4 count > 500	Unknown
Post exposure prophylaxis	Unknown
Prevention of maternal-fetal transmission	Unknown*

* May be teratogenic.

Toxicity

Anemia has been the most frequent serious toxicity seen with zidovudine, having occurred in 24 percent of patients receiving the drug in the original trial. In fact, more recent experience suggests that up to 50 percent of patients receiving long-term therapy with zidovudine may experience clinically significant anemia with a significant subset of these requiring frequent red-cell transfusions. The anemia is a megaloblastic type, which does not appear to be secondary to folate or B_{12} deficiency although concomitant deficiencies of these vitamins can potentiate the severity of anemia. In addition, anemia is more likely to occur in patients with preexisting anemia from any cause and in patients with low CD-4 counts. Recent studies indicate that the anemia associated with zidovudine use may be ameliorated by the use of erythropoietin (EPO), available under a treatment IND mechanism (physicians can call 1-800-24-EPREX for more information). This agent appears to work especially well in individuals with low EPO levels. Neutropenia is a less frequent hematologic toxicity and occurs with greater frequency in patients receiving concomitant administration with other antiretroviral agents such as interferon alpha.

Other adverse reactions to zidovudine include a skeletal muscle myopathy that typically appears after several months of therapy and most frequently involves the proximal musculature with or without elevations in creatinine phosphokinase (CPK). Headaches, nausea, and vomiting are common side effects and may necessitate dosage reduction. Rashes, bluish nail discoloration, and transaminase elevations also have been reported with variable frequency.

Drug Resistance

There has been much concern focused on the issue of zidovudine resistance. Isolation of *in vitro* zidovudine-resistant HIV-1 strains has been reported from some patients. Patients from whom these strains have been isolated showed no signs of clinical deterioration or increase in retroviral activity. Thus, whether viral resistance is a significant factor in explaining declining clinical responsiveness to zidovudine is an open question since there is little substantive data. In light of other models of viral resistance such as acyclovir-resistant herpes simplex virus, it seems likely that clinically significant HIV-1 resistance to zidovudine will be a problem.

Indications for Use

1. Patients with CD-4 counts < 200 cells/mm^3 and/or a history of PCP This is the only current indication designated by the FDA.

2. AIDS dementia complex AIDS dementia complex

is one of the many well-described neurologic manifestations of HIV infection and is thought to be a consequence of direct viral infection of the central nervous system. Zidovudine has been found to arrest or even reverse the manifestations of this syndrome in both adults and children and should be used in this context.

3. Patients with CD-4 counts > 200 cells/mm³ In August 1989 the National Institute of Allergy and Infectious Diseases (NIAID) released preliminary results of two multicenter placebo controlled trials evaluating zidovudine therapy in patients with HIV-1 infection and CD-4 counts > 200 cells/mm³. In study #016, 713 symptomatic patients (for example, oral thrush, chronic rash, or intermittent diarrhea) with baseline CD-4 counts of 200-800 cells/mm³ were randomized to receive zidovudine at 200 mg every four hours (1200 mg/day) or placebo. Of the 51 patients who had reached a study endpoint defined by advanced ARC or AIDS by July 1989, 36 were in the placebo arm while 14 were in the zidovudine arm. Due to the distribution of endpoints, these differences were significant only for those patients with CD-4 counts of 200-500 cells/mm³. Based on these results, the study was halted and all persons on the placebo arm were offered zidovudine therapy.

In study #019, 3,210 asymptomatic patients with CD-4 counts of > 200 cells/mm³ were randomized to receive zidovudine at either 500 mg five times a day (1500 mg/day), 100 mg five times a day (500 mg/day), or placebo. By August 1989 the number of patients with CD-4 counts between 200 and 500 cells/mm³ receiving either dose of zidovudine who reached a study endpoint (advanced ARC, AIDS, or death) was roughly half that of the placebo group. Furthermore, there appeared to be no difference between the two dosage groups with respect to efficacy although the lower dose was considerably less toxic. Based on these results, the placebo arm for patients with < 500 CD-4 cells/mm³ was halted and all patients in the placebo group were offered zidovudine in a dose of 500 mg/day. The study was continued for the group with a CD-4 count of > 500 cells/mm³.

Based on preliminary data from these two important studies, it appears zidovudine may benefit HIV-1 infected patients with CD-4 counts between 200 and 500 cells/mm³ regardless of symptoms. It is unclear whether zidovudine will benefit patients with CD-4 counts > 500 cells/mm³. Data from these studies has not been published or otherwise made available for careful peer review. Consequently, the FDA has not yet revised its recommendations regarding the indications for zidovudine use (see above). Practicing physicians should be cautious in interpreting these data until more complete details are available. However, the general feeling among investigators at present is that zidovudine is of value for patients with HIV-1 infection and less than 500 CD-4 cells/mm³ and that low- dose therapy (100 mg five times a day) may be as good as standard dose therapy (200 mg every four hours).

4. Postexposure prophylaxis. Concern about occupational exposure to HIV has raised the question of whether zidovudine should be used as a prophylactic agent for needle-stick injuries or mucous membrane splashes with contaminated material. Certain related facts are well established. First, the risk of HIV seroconversion from an infected needle-stick injury probably depends on the depth of injury and volume of inoculate. If one considers all cases, the seroconversion rate is in the range of 0.3 to 0.5 percent per injury, yet the risk may be substantially higher from a deep, freshly drawn, high-volume inoculation. Second, data from animal retroviral models suggest that infection can be averted if zidovudine is given immediately after exposure. Based on these data, some centers including the Occupational Health Service in the Clinical Center at NIH offer employees the option of taking zidovudine, 200 mg every four hours for 6 weeks, after a needle-stick injury based on the perceived risk of seroconversion judged on a case-by-case basis. Due to the low rate of seroconversion, demonstrating the efficacy of such a regimen would require a large randomized placebo controlled trial that would be all but impossible to implement. Consequently, we may never know whether post-exposure prophylaxis with zidovudine or any other antiretroviral agent is indicated. However, our practice is to advise the use of such prophylactic therapy following significant exposures.

5. Prevention of maternal-fetal transmission The prenatal treatment of HIV-1 infected mothers with zidovudine to prevent fetal infection remains a provocative issue. Animal models suggest that treatment in the early stages of pregnancy may prevent fetal transmission. However, due to the teratogenic potential of nucleoside analogues, the use of zidovudine in this setting is neither approved nor recommended at this time.

Optimal Dosing of Zidovudine

The current recommendation for initial dosing of zidovudine calls for 200 mg given orally every four hours (1200 mg/day). Yet as we have seen, the frequency and severity of adverse reactions with such a dose is substantial. Also, since many patients suffer from sleeping disorders as a consequence of their infection, their compliance with the early morning dose is variable since it requires waking up to take the drug. A number of studies are under way to decide whether less drug, less frequently is as good. Preliminary results from study #019 described above suggest that at least in patients with 200-500 CD-4 cells/mm³, 500 mg/day is equivalent to 1500 mg/day in efficacy and is also less toxic. In another ongoing multicenter trial of zidovudine in patients with CD-4 counts < 200 cells/mm³ (study #002), preliminary results suggest that 100 mg every four hours (600 mg/day) is as efficacious as 250 mg every four hours (1500 mg/day). Again, none of these data have been made available for peer review. Therefore at this point, no firm conclusions can be drawn as to whether less drug should

be prescribed. Formal judgments by the FDA on these issues should be forthcoming.

Interferon Alpha

The interferons are a family of proteins which have antiviral, antiproliferative, and immunomodulatory properties. Interferon alpha consists of at least 14 different subtypes and has been studied as both an antitumor and antiviral agent. As an antitumor agent, even before the AIDS epidemic, interferon alpha was found to be effective as a systemic agent for the treatment of hairy cell leukemia for which it is now licensed by the FDA. As an antiviral agent, it is currently licensed for intralesional treatment of genital warts (condylomata acuminata) caused by a papillomavirus.

Interferon alpha was tested early in the AIDS epidemic as a treatment for Kaposi's sarcoma (KS) and as a treatment for the underlying retroviral infection itself. It has been shown to be effective as a treatment for KS, and its effectiveness is directly proportional to the degree of remaining immunologic function. It has been demonstrated that patients with KS and a CD-4 count of > 600 cells/mm^3 have an 80 percent response rate to interferon alpha therapy as determined by partial or complete resolution of tumor nodules. In contrast, patients with KS and CD-4 counts of < 150 cells/mm^3 have a response rate of ≤ 10 percent. Those patients with CD-4 counts between 150 and 600/mm^3 have an intermediate response rate that correlates directly with the CD-4 count. On the basis of these data, the FDA recently approved interferon alpha for the treatment of KS in patients with HIV infection.

The antiretroviral action of interferon alpha involves a different mechanism from that of the nucleoside analogues and as a consequence both agents may work together synergistically. Interferon alpha inhibits viral replication later in the cycle by preventing assembly and subsequent budding off of whole virions. In two separate studies, interferon alpha was found to significantly reduce indices of viral replication such as p24 antigen level. As in the case of activity against KS, this activity was most pronounced in those patients with the higher CD-4 counts. The ultimate decision regarding approval of interferon alpha as an antiretroviral agent independent of its activity against HIV-related KS awaits further results from controlled trials of this agent alone and in combination with zidovudine that are ongoing.

The optimal dose and frequency of administration of interferon alpha for the treatment of HIV-related KS is yet to be determined. We have aimed toward a goal of administering 35 million units daily by subcutaneous injection. However, due to substantial dose-related toxicity, most patients have not tolerated doses that high. Fortunately, doses even as low as 3 million units per day seem to have some antitumor activity. In practice, a starting dose of 1 million units daily is judicious, followed by a doubling every two weeks until the maximally tolerated dose is reached. Careful education and training is vital to assure that the patient can successfully administer the drug by subcutaneous injection.

The most frequent adverse reaction seen with interferon alpha is a flu-like syndrome characterized by low grade fevers, malaise, and myalgias that can be severely debilitating. Neutropenia is seen with lesser frequency and is often potentiated by concomitant use of zidovudine. Both types of adverse reactions respond to dose reduction.

Other Important Dideoxynucleoside Analogues

Dideoxycitidine (ddC) ddC has been found to be a more potent inhibitor of reverse transcriptase *in vitro* than is zidovudine. It has a similar plasma $T_{1/2}$ but penetrates cerebospinal fluid less well than zidovudine, reaching levels only 20 percent of peak plasma levels. This may be important in considering potential uses for the drug. The results of the initial clinical studies with ddC were very optimistic. ddC was shown to decrease p24 antigen levels, increase CD-4 counts, and improve other measures of cellular immune function. Unfortunately, drug toxicity has somewhat limited its use. After 8 to 14 weeks on ddC, a substantial number of patients developed a painful sensory-motor peripheral neuropathy, the severity of which seemed to be dose dependent. Some patients receiving the highest doses of drug still had moderate symptoms even up to a year after the drug was discontinued. Nevertheless, this important antiretroviral agent may yet have a place in the treatment of HIV infection. Studies evaluating the combined use of ddC and zidovudine are ongoing in which patients receive alternating drug therapy in seven-day cycles. It is hoped that not only will such a regimen prove to be less toxic but also may prevent the emergence of drug resistance in a given individual. This drug is not available outside of a formal research setting at this time.

Dideoxyinosine (ddI) ddI has been the most recent dideoxynucleoside analogue to show promise as an antiretroviral agent due to its apparent antiviral activity and relatively low toxicity. Although the plasma $T_{1/2}$ of ddI is only 35 minutes, its intracellular $T_{1/2}$ is in the range of 12 to 24 hours. Consequently, it is thought that twice daily oral dosing may be adequate. Since the drug is acid-sensitive, concomitant administration with antacids prevents inactivation by gastric acid.

In the initial phase I trial of ddI, approximately 90 patients with either AIDS or ARC were treated with doses ranging from 0.4 mg/kg to 25.6 mg/kg twice daily. Increases in CD-4 count, decreases in p24 antigen level, or both were seen in greater than 50 percent of the evaluable patient group. A beneficial clinical response was seen in 60 percent of the patients, characterized by significant weight gain and/or reduction in constitutional signs and symptoms.

So far, the major dose-limiting toxicity of ddI has been a painful sensory neuropathy that has developed in 14 patients, 8 to 12 weeks after initiating treatment. Nerve conduction studies on these patients have not shown any significant abnormalities. In all cases,

symptoms resolved within 1 to 2 weeks of discontinuation of the drug. Symptomatic pancreatitis in 5 patients and asymptomatic amylase elevation in 2 patients have been reported beginning 8 to 19 weeks after initiating therapy, necessitating discontinuation of drug. Other adverse reactions have included transaminase elevations, increases in uric acid, and occasional decreases in neutrophils and platelets. Whether one or more of these toxicities will become a major problem once a therapeutic dose range has been established remains to be determined.

ddI is now available to patients by several different mechanisms (Table 2). Three phase II clinical trials enrolling patients with AIDS or advanced ARC are being conducted through the nationwide network of AIDS Clinical Trials Group (ACTG) units administered by NIAID. In addition, under a Treatment IND, ddI is available free of charge to practicing physicians with patients who have experienced significant toxicity to zidovudine. The program is being administered and funded by Bristol-Myers, maker of the drug. Patients are enrolled and monitored for toxicity by their physicians. Finally, ddI is available, also free of charge, through an open safety protocol for patients whose disease has progressed despite zidovudine therapy. Physicians, patients, and others interested in the ACTG clinical trials can call 1-800-TRIALS-A from 9 AM to 7 PM eastern time, Monday through Friday. Physicians interested in details of the Treatment IND and open safety protocol can call Bristol-Myers toll-free at 1-800-662-7999 daily from 8 AM to 8 PM eastern time.

Table 2. Current ddI Trials

Clinical Trial	Patient Group
Trial #116	Double blind study of AZT vs. ddI
Trial #117	ddI vs. AZT in patients on AZT > 1 year
Trial #118	ddI for AZT-intolerant patients
Treatment IND	Open drug for patients with dose-limiting toxicity to AZT
Open Safety Protocol	Open drug for patients with disease progression despite AZT

Other Antiretroviral Agents

Several other antiretroviral agents are in various stages of clinical investigation and worthy of mention. AzdU (3'-Azido-2',3'-dideoxyuridine) is another nucleoside analogue with considerable antiretroviral activity, *in vitro*. Phase I studies have so far shown the drug to be well tolerated in the lowest dose ranges. Efficacy data is not yet available. Foscarnet (phosphonoformate) is a pyrophosphate analogue shown to have significant clinical activity against herpesviruses including CMV. It is also an inhibitor of reverse transcriptase. *In vitro* studies and uncontrolled clinical data have shown it to have activity against HIV. Soluble CD-4, whether alone or as an IgG conjugate, has shown promise as an agent that, *in vitro*, binds to the viral envelope and prevents viral attachment to target cells. Clinical trials employing soluble CD-4 are under way.

Summary

We have seen a dramatic increase in the types of antiviral strategies and numbers of specific antiviral agents that have emerged since the early 1980s when infection with the human immunodeficiency virus was first recognized. At the moment, zidovudine is the only drug approved by the FDA for treatment of HIV infection, and its indication is limited only to patients in the most advanced stages of immunodeficiency. Although zidovudine cannot "cure" HIV infection, it can significantly delay the seemingly inexorable course of immune system decline and buy some meaningful time for most HIV-1 infected patients, whether or not they have developed immunodeficiency.

Other agents such as interferon alpha and the dideoxynucleoside analogues, ddI and ddC, have also shown promise as antiretroviral agents, and it is hoped they will be proved, in the near future, capable of delaying the progression of immune system destruction by HIV-1. Other related treatment modalities such as the use of PCP prophylactic regimens also have succeeded in decreasing the incidence of opportunistic infections and thereby improving survival. It is likely that future strategies will involve the use of alternating, multidrug regimens both to reduce selective pressure for the development of drug resistance and to minimize the toxicity of single-agent therapy. The sum of these developments has been to change the prognosis of HIV infection. A disease once viewed as an automatic death warrant is now in the process of becoming a chronic, potentially long-term treatable illness.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

Call the Medical Solutions Management representative at (301) 539-0872 or toll-free in Maryland at 1-800-492-1056.

Pediatric AIDS Care in Maryland

John P. Johnson MD

Dr. Johnson is Chief, Division of Immunology, Department of Pediatrics, University of Maryland School of Medicine.

The complexities of care for persons at risk for or infected with human immunodeficiency virus (HIV) are no greater for any other population than for children.[1-6] Their unusual medical, social, and public health considerations have demanded a separate system of care from that for adults.[7]

The needs of children at risk for AIDS and the development of a new system of care in response to their needs involves the collaborative efforts of the Department of Health and Mental Hygiene, AIDS Administration, the city of Baltimore, the medical centers, and a variety of social service organizations.

The AIDS epidemic is having a significant impact on the pediatric population in the United States. Conditions related to infection with HIV are currently the ninth leading cause of death among children 1 to 4 years old, and the seventh leading cause in young people between the ages of 15 and 24. (Secretary, US Department of Health and Human Services [HHS] Work Group on Pediatric Infection and Disease, 1988).[8] If current trends continue, conditions related to HIV infection will become one of the five leading causes of death among these groups in the next 3 to 4 years.

As of October 31, 1989, more than 112,200 persons (2,148 in Maryland as of November 30) were reported as having met the Centers for Disease Control (CDC) AIDS case criteria in the US.[9] Of these cases, 1,908 were infants and children under age of 13, while 439 were adolescents between the ages of 13 to 19 years old. Within Maryland, 48 children and 11 adolescents have been reported as meeting the CDC AIDS case definition.[10] Maryland ranks within the top ten states in reported pediatric and female AIDS cases.

CDC AIDS case counts significantly underrepresent the number of children infected with HIV, however, because these numbers do not include infected children who are either asymptomatic or have HIV-related conditions falling outside the CDC AIDS case criteria. Using case-estimation methods, Maryland Department of Health and Mental Hygiene staff estimate that by 1993 at least 643 children will be infected perinatally with HIV.

Currently, over 300 children have been identified as HIV at-risk or infected in Baltimore. The University of Maryland is following over 200 children, 60 of whom have AIDS or HIV-related diseases. Johns Hopkins Hospital follows approximately 100 children, 40 of whom have HIV mediated disease. Approximately half these

children fall into the CDC classification of indeterminate infection, that is, born to women with HIV infection. Approximately one-third of those at-risk children will be HIV infected. Of these infected children, approximately half will develop AIDS in the first year of life, although the majority will have symptoms of HIV infection.[11]

All these children, whether or not infected, may suffer the many psychosocial consequences associated with HIV infection in families: poor housing and poor access to services; lack of daycare, foster care, and community support/integration. Issues of death and dying are overlaid with socioeconomic obstacles and psychosocial burdens rendering these families marginally able to cope with the demands of the child's illness. Such stress produces recidivism of at-risk behavior. To cope with the community impact of HIV infection in children, it is essential to develop a system of care that is responsive and sensitive to the needs of the family in its environment.

Existing Resources

The Baltimore Metropolitan area and the state of Maryland have a wealth of medical and community resources for caring for HIV-infected patients. Additionally, a variety of programs to address areas of special concerns are under development.

Maryland Department of Health and Mental Hygiene The responsibility of the state in HIV disease derives from Health General Article §18-101 and §18-102 requiring the Secretary to investigate the causes and prevent the spread of communicable diseases. HIV infection is covered by both the State Medicaid Program (Title XIX) and the State Crippled Children's Program (Title V).

The Assistant Directorate for AIDS Health Services of the Maryland Department of Health and Mental Hygiene is responsible for planning, developing, and implementing statewide programs for the identification, evaluation, treatment, and support of individuals and families affected by the epidemic of HIV. The Assistant Directorate for Health Services is organized into four divisions to address these mandates: Counseling and Testing Services (CATS); Patient Care Services; Planning, Evaluation, and Resources Development; and Provider Education and Training.

State services for HIV-infected individuals include counseling and testing sites, seropositive follow-up clinics, AIDS Diagnostic Evaluation Units (DEU, the University of Maryland for pediatric patients and the Johns Hopkins University for adults) and patient and family assistance programs.

Medical Services

University of Maryland The University of Maryland Department of Pediatrics has established as part of its Pediatric Diagnostic and Evaluation Unit services two clinics for the pediatric population, the PACE and SPICE clinics.

The Special Parent and Infant Care and Enrichment (SPICE) clinic is a comprehensive, primary care clinic that follows infants born to mothers who are HIV seropositive. The majority of these mothers are identified through obstetric screening. Infants are followed in the SPICE clinic until there is evidence of immune dysfunction or until they are considered not infected.

The Pediatric AIDS Care and Evaluation (PACE) clinic provides the specialized care necessary for children who have developed HIV-mediated disease, AIDS-Related Complex (ARC), or AIDS. Once it is determined that they are infected or are developing symptoms of ARC or AIDS, children may be referred to PACE from either the SPICE clinic or from the community. Children to be evaluated for the possibility of HIV infection or other immunodeficiency disease also are seen in the PACE clinic.

Children receive appropriate evaluation and treatment for immunologic, infectious, neurologic, and other manifestations of disease. While the clinic provides both a research and clinical component, infants referred to the clinic do not have to participate in a research protocol. The multidisciplinary staff consists of specialists in Immunology, Developmental Pediatrics, Neurology, and Infectious Diseases. An expert nursing staff consisting of two nurse practitioners and two nurses provide home evaluations and treatments. A social services staff is available to parents and family to assist in providing counseling services, including placement, housing, and benefits. This staff is also a resource for community practitioners and organizations for advice regarding care and available services.

Johns Hopkins Hospital "Intensive Primary Care" (IPC) Program for Infants Infants are identified as at-risk for HIV infection while the mother is on The Johns Hopkins Hospital postpartum floor. The mother meets the visiting nurse and the social worker of the IPC and receives a two-week appointment for the infant to attend the clinic where the infant is assigned to a Pediatric Nurse Practitioner (PNP). The PNP provides primary care to the infant over the 15-month study period.

At each clinic visit the social worker tries to meet with the family for support and to provide resources. Home visits are provided to the infants by a PNP and the social worker. The purpose of the home visits are threefold:

1. They allow assessment of the infant for symptoms of infections, poor nutrition, developmental status, and social risk factors.
2. They provide time to teach parents basic child care and infection control measures.
3. They provide another time for support as well as "keeping track" of the families.

Children may be referred to the Infectious Disease Clinic if they develop symptoms of HIV infection, and they can be followed by a multidisciplinary staff. Appropriate assessments and treatments are provided.

Home Care

Mt. Washington Pediatric Hospital, Inc. and Home Health Agency Mt. Washington Home Health Agency provides a variety of services for children with AIDS and other conditions related to HIV infection. Pediatric registered nurses provide home-based monitoring assessment, parent training, and skilled intervention to infants and children. Frequency of service depends on the physician's orders. A nurse may visit as frequently as every day or as infrequently as once each week.

Home Health Aides provide nonskilled personal care and other health-related services under the direct supervision of the agency registered nurse. Service may be provided for three hours, five days per week unless preauthorization for greater service is received through Medicaid.

Home-based rehabilitation services are available to those children who are not receiving these services from school-based programs or who have developmental delay or handicapping conditions.

Developmental Disability Services

PACT Parents and Children Together is a nonprofit, private program committed to providing innovative, quality programs for children (ages birth to three years) who have suspected or identified developmental delays. PACT offers comprehensive evaluation and treatment services to children, and support services to their families. These services include those of a consulting developmental pediatrician, a physical therapist, an occupational therapist, a speech-language pathologist, a public health nurse, a social worker, and a child development specialist. Services are individualized according to the unique needs of each child and his/her family.

Kennedy Family Support Services The Family Centered Planning Program at the Kennedy Institute is a home and community centered program for families who have children who are developmentally disabled, between 0 and 21 years of age, living at home in Baltimore City, and medically eligible for Supplemental Security Income (SSI).

The program consists of professionals who will assist the family in utilizing a variety of available resources and support including respite care, physicians, financial assistance, special equipment, educational plans, and recreational programs.

With the goal assisting families in planning the most appropriate services for their child the program will identify service and resource needs, establish a community team for planning family support services, assure that the family receives appropriately delivered services, disseminate information that will facilitate public awareness, identify funding sources when emergency services are required, and assist the family and child to plan for future self-advocacy and coordination. Parents voluntarily participate with program staff when help is needed with skill development, decision making, problem solving, service arrangement, and medical treatment.

Technology Dependent Care The Coordinating Center for Home and Community Care (CCHCC) has developed a case-management model that includes a multidisciplinary coordination system that facilitates the discharge of medically fragile infants/children with technology assistance from hospital to home. This comprehensive program assures quality and continuity of coordinated services as well as monitoring of provision and cost.

The Maryland Model Waiver was designed to enable children who otherwise would remain hospitalized (at substantial cost to Medicaid) to move home on Medicaid Waiver funds.

Children have been going home from hospitals with services funded through the Waiver since October 1985. The Maryland Model Waiver System has been recognized nationally as a unique quality assured cost efficient program. The Maryland Medical Assistance program, Children's Medical Services, and the Coordinating Center have worked cooperatively to put this comprehensive system in place in Maryland.

Housing

Project Home The AIDS Project of Project Home operates out of the CARE Program of Adult and Family Services of the Department of Human Resources (DHR). This program provides funding to clients through Public Assistance to Adults. It enables them to pay for their housing and personal care needs in licensed foster homes (one to three occupants), supervised apartments (one to three occupants), or group homes (four to eight occupants). It is their intention to provide housing for families of children affected by HIV infection. In each setting, there must be a certified provider who has been approved and trained to provide personal care as needed and supervision to persons with AIDS or other conditions related to AIDS. In addition to room, board, and personal care, this program also provides case management and a medicaid card to each client.

Foster Care The Baltimore City Department of Social Services has been placing at-risk children, children who are HIV positive, and children with symptoms in standard foster homes. However, these foster parents need additional training to care for medically fragile children who develop AIDS. The need for additional homes and alternative community placements through the Department of Social Services is growing.

The Kennedy Specialized Foster Care Program trains foster parents to meet the special medical needs of these children. The Baltimore Association for

Retarded Citizens also is available to provide short-term foster care.

Respite Care The YWCA of Baltimore provides the respite care for children up to five years old who, for medical, legal, or personal reasons, need emergency shelter.

Daycare - Head Start

The Urban Services/Head Start Program has developed a program to provide comprehensive services to HIV/AIDS-infected children birth to 5 years of age. Training has been provided to all staff and parents and all 22 sites are prepared to accept infected children. All components of Head Start are available to this population. They include education, parent involvement, social services, and health services to the handicapped. Children are integrated into the centers based on age and medical status. Referrals are made if Head Start is an inappropriate placement. A separate classroom for infected children with unique needs is under development.

For HIV-infected children and families, a team develops family needs assessment and an individual family program plan. Group or individual counseling to families, specific staff training, and case coordination are also available. A Head Start AIDS Advisory Board serves as a vehicle to network services for families.

Counseling And Prevention

Health Education Resources Organization (HERO) HERO is one of the oldest and best established community-based AIDS organizations in the country. Programs include both professional and at-risk education and counseling and patient services delivery including case management and a buddy system. A collaborative effort among the Maryland State and Baltimore City Drug Abuse Programs and HERO reaches IV drug users who are not in treatment and their sexual partners. HERO recruits recovered addicts and extensively trains them to bring the AIDS prevention message to those areas with the most need. HERO provides a variety of patient services including group therapy, "buddies," an information repository, and financial assistance.

HERO pioneered AIDS outreach education among minorities. HERO's Minority Outreach Program works closely with black leaders to implement educational programs. HERO develops special educational pamphlets and posters to reach minorities. HERO cultivates minority volunteers to continue outreach education and enjoys strong support from the minority media in developing on-going messages targeted at the minority community. HERO (as well as Earth Tide) intends to provide services to families of HIV-infected children.

EarthTide EarthTide is a minority community based AIDS organization that targets adult minority females who are at-risk for HIV infection and transmission. The project is designed to provide women with alternatives to high-risk behaviors and to address personally and socially relevant issues affecting minority women. Safer sex parties and discussion strategies are used to present and communicate HIV risk-reduction information.

The IVD Outreach Project targets adult IVDAs who are recovering and possibly at-risk for HIV infection and transmission. The project is designed to present to recovering IVDAs alternatives to high-risk sexual behaviors and to provide support for psychosocial adjustments to the recovery stage of their addiction. Small group discussion and group strategies are used to communicate information to the targeted population.

Continued Love Continued Love is also a minority community based AIDS organization whose intent is to fill gaps in services to HIV-infected infants and children. Community education/prevention efforts have dominated the last years' effort. Plans to open a daycare center for HIV-infected children in collaboration with Head Start are complete.

Legal Services

The University of Maryland School of Law AIDS Legal Clinic The AIDS Legal Clinic is the first of its kind in the country to confront difficult issues facing lawyers today. The clinic also provides students and professors the unique opportunity to collaborate with physicians and social workers in addressing the myriad legal problems raised by the AIDS epidemic. The AIDS Legal Clinic has begun working with the Pediatric AIDS Clinic at the University Hospital and has developed expertise in the special issues pertinent to children with HIV infection.

MAARETC

The Mid-Atlantic AIDS Education and Training Center (MAARETC) is one of 13 multidisciplinary centers nationwide funded by the Health Resources Services Administration of the Public Health Service. MAARETC, headquartered at the University of Maryland at Baltimore, coordinates activities through area resource centers in Delaware, District of Columbia, Maryland, Virginia and West Virginia. Working collaboratively with health service delivery agencies, professional organizations and educational institutions, the area resource center provide AIDS/HIV training for health care professionals. Curricula cover all aspects of the HIV/AIDS epidemic, including medical, dental, pediatric, psychiatric, psychosocial, social policy, workplace issues, and ethical and legal issues. Enhancement of primary care provider abilities is a special concern.

The PACC Program

The State of Maryland, Department of Health and

Mental Hygiene (AIDS Administration), the city of Baltimore Head Start program, the school-based program, the medical institutions, and the social service organizations are collaborating in the development of a system to coordinate, monitor, and improve the provision of services and care to HIV-infected children.

The central goal of this Pediatric AIDS Care Consortium (PACC) will be the establishment and support of a widespread coordinated community based care system accessible to all practitioners for families affected by HIV. The underlying principle behind this effort is reliance on existing reimbursement mechanisms as being sufficient to meet all the needs of these children, while recognizing the immediate need for establishing a consistent coordinated system that is effective in its delivery of services.

With the newly available reimbursement of case-management services by the state's Medicaid Program, it is anticipated that the majority of at-risk children will soon receive these services. Case management may be done by any licensed care provider (physician, nurse, social worker) willing to coordinate and monitor provision of medical and social services to an infected child in the coummunity.

The PACC Team will establish case-management protocols for agencies and individuals willing to provide pediatric case management in the Baltimore Metropolitan Area and, as needed, to other areas of Maryland. The Steering Committee of PACC will include new service providers as they become established in the Baltimore Metropolitan Area. Each service provider will have representation on the Steering Committee, whose goals will be to

1. discuss changes in the epidemiology of the AIDS epidemic in the Baltimore Metropolitan Area
2. identify current resources and the need for new or expanded services in the Baltimore area
3. facilitate mechanisms to provide these services through an advocacy network
4. review the progress of the provision of service
5. act as a central clearinghouse for practitioners requiring information or support

Establishing a coordinated system will require an agreement on approach and provision of education to potential case managers. Kennedy Family Support Services recently has been awarded an HHS Special regional area network grant to provide education for a family oriented case management system. Agencies that wish to provide case management service to these children should contact the University of Maryland Pediatric AIDS Program or DHMH, AIDS Administration, for support in getting established.

The other area of professional education that will be the responsibility of the PACC team is education to pediatricians, obstetricians, and social service agencies following at-risk populations to help them identify risk factors for HIV infection and to provide training regarding counseling, testing, and medical follow-up. One great obstacle to this process is primary care providers' lack of confidence to care for such patients. The Mid-Atlantic Regional AIDS Education and Training Center will collaborate by providing educational programs to groups or individual care providers.

By establishing a coordinated system of education and services for children with HIV infection (which also utilizes newly developed reimbursement programs), it will be possible to increase both awareness of and security in identifying and caring for the children by primary practitioners. The promise of newer therapeutic modalities for treatment and perhaps even prevention of perinatally acquired HIV infection can be realized only if primary practitioners are willing to recognize that HIV infection is a common medical and social issue demanding our utmost commitment. Practitioners and service organizations are urged to call the University of Maryland PACE Unit (301-328-8220) or the Marylands DHMH AIDS Administration (301-225-1054) for more information.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.

Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

An Integrated Primary Care System for HIV Disease

Mark D. Smith MD, MBA

The author is Associate Director, AIDS Service, The Johns Hopkins Hospital.

Although a "cure" for HIV infection has not yet been found, there are increasing numbers of options for treatment. Like other more familiar diseases, HIV/AIDS present lifelong management responsibilities for both patient and clinician.

From the early days of the AIDS epidemic it has been apparent that successful care of HIV disease would force a re-examination of existing health care systems.[1] The initial manifestations of acquired immune deficiency were *pneumocystis carinii* pneumonia and Kaposi's sarcoma.[2] Later, other opportunistic infections such as cryptococcal meningitis, toxoplasmosis encephalitis, and typical and atypical mycobacterial infection were recognized.[3] More recently, HIV-related dementia and wasting syndrome have become part of the official AIDS definition. In addition, it is clear that a number of non-Kaposi's neoplasms (particularly lymphomas) and increased susceptibility to nonopportunistic pathogens are part of the spectrum of HIV disease.[4]

The good news, outlined more specifically elsewhere in this special issue of the *Maryland Medical Journal,* is that the number of therapeutic options for HIV disease continues to increase. Not only is there a wide range of treatments available for opportunistic infections, but also the first licensed anti-HIV drug, Zidovudine, now clearly has a role in both early and late infection. Furthermore, new antiviral drugs and immunomodulators should further broaden physicians' therapeutic options. Health care providers and systems, however, now face a dilemma: we know more than we can deliver. Thus the growth in the available therapeutic options and the increasing life span of people with HIV disease (even in its later stages, AIDS) present clinicians with a problem: how to construct and maintain a primary care system capable of handling patients with the disease.

Why is AIDS a Primary Care Disease?

The primary care movement has grown in the last 20 years as a reaction to the increased specialization and compartmentalization of American medicine. One definition of primary care deals with the patient care functions of primary care doctors: to provide access, continuity, and integration.[5] Another text has a somewhat broader view of the primary care function:

> 1) Medical diagnosis and treatment; 2) Psychological diagnosis and treatment; 3) Personal support of patients of all backgrounds, and all states of

illness; 4) Communication of information about diagnosis, treatment, prevention, and prognosis; 5) Maintenance of patients with chronic illnesses; 6) Prevention of disability and disease through detection, education, persuasion, and preventive treatment.[6]

Care of persons with HIV disease clearly requires all six of these tasks. AIDS also has a number of distinctive features that make it particularly suitable for a primary care approach:

HIV Infection is a Chronic Disease Although a "cure" has not yet been found, there are increasing options for treatment: thus HIV, like the more familiar diabetes and hypertension, presents lifelong management responsibilities to patient and clinician alike.

HIV Infection is a Multisystem Disease HIV and opportunistic pathogens can affect every organ system of the body. Unless the patient has a physician possessing wide knowledge in a number of fields and capable of judicious use of specialists were necessary, the patient is at risk of being parcelled out among opthamologists, dermatologists, neurologists, gastroenterologists, etc.

HIV Infection is a Highly Labile Disease Not only can patients go ten years or more after infection without showing symptoms, but also acute exacerbations of disease such as opportunistic infections may be punctuated by relatively long stretches of less symptomatic disease. Physicians experienced in HIV care know that patients may look well one day and be deathly ill the next; conversely, some who require intense inpatient hospital treatment may, after antibiotic, antineoplastic, or other therapy, revert to their baseline state. The implication for the health care system is that HIV-infected patients, particularly those who are symptomatic, must have access to providers who can respond rapidly to changes in their clinical condition.

What Are the Requirements of a Primary Care System for HIV?

Outpatient Care The linchpin of primary care for HIV, as for other chronic diseases, is outpatient care (Figure). The past few years have shown that such care, to be effective, must have three central characteristics: aggressiveness, multidisplinary character, and linkages with other parts of the system.

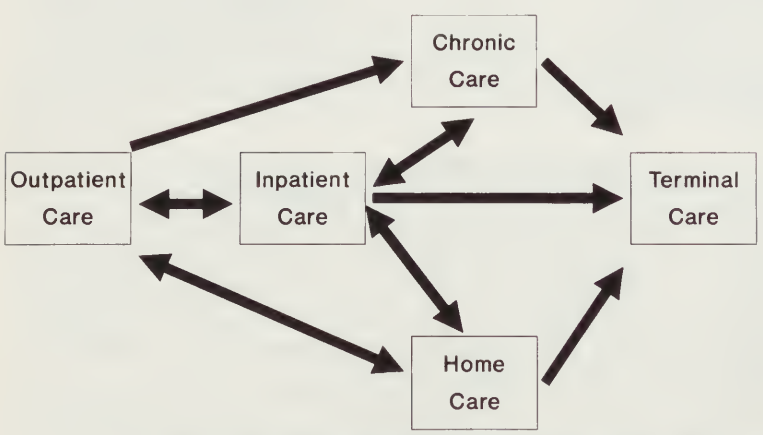

Figure. Spectrum of Facilities Needed for HIV Care

Because of pressures to reduce inpatient hospitalization, HIV outpatient care has become substantially more *aggressive* as physicians have become more and more comfortable with new techniques. Many providers caring for HIV-infected patients now routinely perform such diagnostic and therapeutic procedures as lumbar punctures, transfusions, intravenous hydration, administration of chemotherapy, and induction of sputum for diagnosis of pulmonary infections; each of these was either developed in response to the AIDS epidemic or would have been unthinkable except on an inpatient basis as recently as five or six years ago.

A *multidisplinary approach* is key. Because patients present with a variety of medical, emotional, and social problems, it is important for outpatient care to be able to call on the expertise of medical subspecialists as well as psychologists, psychiatrists, and social workers. Smooth working relationships and, if possible, convenient arrangements for rapid referral to such colleagues as neurologists and opthamologists have been an important part of delivering primary care at The Johns Hopkins Hospital and other major HIV centers.

Outpatient medicine can sometimes be hectic: often there is not time to pursue extended workups or discuss patients' social and emotional needs. It is therefore particularly important that outpatient care have *strong linkages* with the other forms of care HIV-infected patients will need: communication with inpatient units, chronic care facilities, and home health providers will substantially ease the tasks of caring for patients in a busy outpatient setting.

Inpatient Care Despite the intensity of outpatient HIV care, most patients eventually will require hospitalization for one or more periods. It is important that providers caring for HIV-infected patients have access to appropriate inpatient settings when they become necessary. Virtually all hospitals in Maryland have cared for at least one AIDS patient in the course of the epidemic. Some, like Johns Hopkins, have dedicated AIDS units; most do not. Whatever the arrangement, it is important that hospitals be able not only to provide competent medical care to AIDS patients but also to provide a supportive and compassionate environment free of stigma or hysteria.

Home Care The HIV epidemic has stimulated substantial innovation in home care.[7] Many companies, both not-for-profit and profit-making, have become expert in the delivery of intensive home-based antibiotics and other therapies. Many patients can be maintained at home with treatments that a few years ago would have required hospitalization.[8] Such solutions are cost-effective and usually preferred by the patient.

Chronic Care Some patients will, toward the end of their disease, become so debilitated that they need more intensive care than a home environment can provide. At the same time, their conditions (HIV dementia, wasting syndrome, and others) will not respond to acute intervention, and therefore do not require inpatient hospital care. For those patients, chronic care facilities are a natural option particularly if they do not have home/family situations that permit constant attention at home. Currently, few nursing homes accept AIDS patients; the provision of more chronic care beds for HIV-infected patients is one of the most pressing priorities for the health care system.[9]

Terminal Care Although life expectancy continues to increase and new therapies are promising, we may expect that most of those currently ill with AIDS will eventually die of it. It is important to discuss with patients and their loved ones their wishes regarding terminal care. Although many AIDS patients were initially hostile to the concept of hospice because of its connotation of "giving up," hospice services now find increasing acceptance in the AIDS community.[10,11] Around the country hospices (both institutional and at-home services) have sprung up to care for people in the terminal phase of HIV infection. While hospice care is not an alternative that all patients will choose, it often will provide appropriate palliative services to keep patients comfortable in their final days.

Psychosocial Support Many AIDS patients will have tremendous need for psychological, emotional, and social support. Some of this need stems from the fact that AIDS, like many forms of cancer and other chronic fatal illnesses, saps both the patients' physical strength and financial resources. In addition, however, society continues to harbor substantial prejudicial attitudes toward people with AIDS.[12] Patients therefore face a variety of threats to their social supports (job, insurance, and even family support) that are uncommon in other diseases. Many states, including Maryland, have developed *case management* systems in an attempt to respond to these needs. Case management seeks to provide patients with an individual who can help coordinate services such as transportation, application for entitlement, and access to other needed medical and social services. AIDS patients will vary widely in their need for such services. Some, particularly those in advanced stages of disease or with substance abuse problems, will need substantial assistance in managing their affairs. Others will be quite self-sufficient and able to coordinate services and make their own decisions. Whatever the patient's needs, physicians should familiarize themselves with the community based support available in their area and refer patients to organizations and agencies that may assist them with this range of needs.

Obstacles to the Development of a Primary Care System

While substantial steps have been made toward the creation of an integrated system to care for HIV-infected patients, much still has to be done in Maryland and elsewhere. The principal obstacles are: inadequate trained personnel, lack of proper financing of care, and institutional wariness about AIDS.

The problem of the provision of enough trained medical personnel to care for AIDS patients throughout the stages of their illness is a difficult one. While most community settings will rely on *physicians* to provide this care, The Johns Hopkins Hospital, San Francisco General Hospital, and a number of other major HIV centers have relied heavily on so-called "mid-levels" (nurse practictioners and physician assistants). We clearly will need more physicians to be involved in this care. The shortage of physicians to care for people with AIDS is a multifactoral problem (Table). For any individual physician the main obstacle may be one or more of the specific areas cited; nevertheless, it will be the task of the medical community, academic centers, and local, state, and federal health officials to overcome each of these obstacles confronting physicians.

Table. Obstacles to Physicians' Caring for HIV - Infected Patients

Information overload	Inadequate reimbursement
Fear of infection	Fear of loss of other patients
Institutional (e.g. hospital) pressure	Burnout
Dislike of homosexuals	Dislike of drug users

Adequate financing of HIV care is a serious problem both to private physicians and to institutions. Many patients with AIDS must rely on Medicaid from the start, or they eventually will become impoverished and turn to Medicaid. Inadequate Medicaid reimbursement for outpatient care, home care, and other parts of the care spectrum is a serious impediment to providing quality care to AIDS patients.

The last major obstacle to creation of an integrated primary care system for patients with HIV infection is the wariness with which many institutions approach care for these patients. Hospitals, nursing homes, home health care agencies, and others face some of the same financial problems faced by physicians. But their inability (or perhaps unwillingness) to solve these problems – felt most strongly in chronic care facilities – is a formidable obstacle to the creation of a rational, compassionate, and cost-effective system.

The Emerging Physician-Patient Partnership

Robert M. Mehl

Beginning with his own diagnosis, a person with AIDS comments on personal philosophies, the change in physician-patient relationships, the political impact of the AIDS epidemic on health care services, and concludes with a list of resources for physicians.

The author is Positive Directions Coordinator, Preventive Medicine and Epidemiology, Baltimore City Health Department.

Although the plague clouds our thoughts and our eyes, we must always remember that AIDS is what has happened to us, not who we are. And that what we do as a society will be measured not by the depth of our grief but by the depth of our commitment to those who suffer.

Robert M. Mehl, 1988

To understand who I am today you need to follow the history of my emotional travels with AIDS.

In February of 1986 I was the Executive Director of the AIDS Medical Foundation (AMF), the creation of Dr. Mathilde Krim, a renowned virologist and humanitarian. She and colleague, Dr. Joseph Sonnabend began seeing unusual pathologies in gay men in New York City. This interest led to the founding of AMF as a means of funding research. (AMF later merged with a west coast group, and the new organization is known as the American Foundation for AIDS Research). I was asked to be Executive Director because of my years as a highly visible liaison to the gay community of New York in the first Koch Administration, and I was as deeply involved in the epidemic as anyone. (I had lost several friends; today that number stands at 43.)

That fateful February I noticed a lump in my groin. It grew and in a month was an inch and a half across. I knew I needed to consult a physician. As a member of an HMO, I was assigned to a surgeon for a biopsy. He postulated that a single swollen lymph node could be either "cat scratch fever" or the much more serious lymphoma. At no time was AIDS suspected or discussed, as I had not as yet been tested for the presence of the virus.

A week later he called me back for the test results. He asked me to sit down and inquired if I knew what AIDS was. I said yes, and he said, "Well, you have it." The biopsied lymph node had visceral Kaposi sarcoma present. I sat stunned! He said, "Well, I'm busy; you will have to excuse me now." My pre- and post- test counseling combined had taken about 30 seconds. I hobbled home and cried for a week. One morning I woke up and realized I couldn't continue like that, and there begins the creative formulation of Living and Surviving with AIDS.

Positive Directions Philosophy

Over the nearly four years since my diagnosis I have developed a personal philosophy of living and surviving AIDS. I called it Positive Directions. It is simple and uncomplicated, basically incorporating many of the "12-step" attitudes, including living "One day at a time" and the old adage "If you have lemons, make lemonade". It stresses quality of life (not quantity) and adds all the principles of long-term survivorship as contained in the research of Dr. George K. Soloman at UCLA.[1] They include:

- Be realistic and accept the AIDS diagnosis but do not take it as a death sentence.
- Have a fighting spirit and refuse to be "helpless-hopeless."
- Change lifestyles.
- Be assertive and have the ability to get out of stressful and unproductive situations.
- Be tuned in to your own psychological and physical needs, and take care of them
- Be able to talk openly about your illness.
- Have a sense of personal responsibility for your health, and look at the treating physician as a collaborator.
- Be altruistically involved with other persons with AIDS

It is a philosophy long on determination and short on self-pity, and its adherents generally live longer and more productive lives. It simply works.

The Old Order and The AIDS Revolution

Time was that a physician, omnipotent and all knowing, would tell the patient what to do, and the patient would say, "Yes, Doctor." Since the advent of AIDS that no longer happens with any regularity. More likely the exchange would be similar to a conversation I had recently with my own "care partner," Dr. Larry Bruni of Washington, DC. Dr. Bruni asked, "What do you think *we* ought to do about this problem?" I am not just an illness with a social security number but a consultant and participant in the process. This attitude is beginning to spread to people with other diseases as well. Not only patients with AIDS but also others suffering from chronic illnesses soon will be confronting their physicians with questions of "What were my test results?" "What do the results mean?" "Why prescribe that medication?"

To a physician from a traditional practice this may appear that the patient is "second-guessing" the doctor. However, it is an opportunity to help the patient become part of the care equation, resulting in better care through cooperative sharing of information. The technical expertise of the physician and the personal, physical information the patient can share will enable both to arrive at a more accurate and quicker diagnosis.

The FDA and the Drug-of-the-Month-Club

Perhaps the most highly publicized and visible result of this new point of view is how a tidal wave of patient protest has caused great change in one of the most immovable and old fashioned agencies in the federal government, the Food and Drug Administration. Founded to protect the public, the FDA has fulfilled that mission well. From the many deaths from antifreeze poisoning in the 1930s leading to the creation of the FDA to the thalidomide scare of the 1960s it was there to "guard the gates." But it became inflexible.

To understand how a rag-tag army of persons with AIDS (PWA) could bring a powerful institution like the FDA to its knees, one needs to understand the movement's roots in Gay Liberation. The gay community was the first group to be devastated by AIDS, and the losses were so great that a huge anger developed. In the late 1960s gay oppression caused a similar anger, which the gay community directed at the powers that be. Over the years they have built that force into great political clout.

That same anger and frustration was turned against the FDA. It is very difficult to hold the status quo when AIDS patients in wheelchairs break down doors. To many this might seem outrageous behavior, but if you have AIDS and only a short time to live, you find it difficult to accept the fact that a drug you could benefit from will not be available for years because of repetitious procedures. This brings us to the Drug-of-the-Month Club.

Because of the great interest in AIDS, many new drugs are coming forward for consideration causing confusion among patients as to their relative benefits. Desperate people sometimes do desperate things, and some AIDS patients switch from one drug to a new one before they see results from the regimen. It is hoped the stabilization of the testing process will pinpoint fewer, more positive medications on which patients can focus. Groups such as Project Inform and *AIDS Treatment News* are doing a great service informing and educating the AIDS community about the relative merits of various new drugs.

Terminology and Point of View

AIDS has developed its own set of expressions and terminology. "What are your T-4 cells?" has replaced "What is your sign?" as party conversation. But there are definite dos and don'ts. People who have this disease prefer to be called persons with AIDS. They are not always patients; that occurs only when they are in that setting of clinic, hospital, or physician's office. They are especially not "victims." A victim is someone who has no control over circumstances. However, a person with AIDS does have an ability to impact on the illness in a constructive and creative way.

Nutrition and Stress Problems

Many physicians are unaware of the particular nutritional problems of PWAs. The disease often is exacerbated by malabsorption and malnutrition. This

"wasting syndrome" takes away the body's strength and ability to fight disease. Calories consumed are often inefficiently used, and as much as half the benefit is lost. Patients should not have to rely on their own resources for nutrition. Food-delivery programs in many major cities provide well-formulated menus for PWAs that meet the nutritional needs and low-motivation of the patients. Baltimore has a program called, "Movable Feast" that is free to clients; a similar program is operating in the District of Columbia.

Reduction of stress is another important factor in the management of HIV disease. Emotional distress and mental anguish have negative impacts on the body's ability to fight off opportunistic infections and disease. Patients need to be taught stress-reduction techniques and guided imagery to better manage periods of undue emotional disturbance.

Impact On the Health Care System

The threat on the health care system in this country and the rest of the world cannot be underestimated. Today we have about 60,000 patients living with AIDS and dealing with periodic bouts with opportunistic infections requiring regular medical supervision and frequent hospitalizations. Another number, perhaps 10 times that 60,000, are seropositive, and some of those individuals are beginning to have slight to serious abnormalities from their HIV infection. This only addresses the present patient load. In the future there probably will not be enough physicians and hospital beds to deal with the flood of new HIV cases.[2] This disease will test not only the ability of our present health care system to manage this horrendous ailment, but also it will test our humanity. If as a society we don't measure up to this task, the entire future of health care and of our commitment to others will be in jeopardy.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

Exceptional Patients Live Long and Live Well

Bernie S. Siegel MD

Dr. Siegel is Assistant Clinical Professor of Surgery at Yale Medical School, and author of the best-selling books, "Love, Medicine and Miracles," and "Peace, Love and Healing."

We should study success by looking at people who survive life-treatening illness. Such "exceptional" patients have certain characteristics in common. We should realize that people want care and healing, not necessarily cure.

It would have been easier to write this twenty years ago when "living long" meant to live many years and living well meant life with the absence of disease. My definitions are different now. Today, "long" relates to the time it takes to accomplish something with one's life, and "well" equates with peace of mind and loving relationships, rather than to a state of the body. Thus I know a nine-year-old who lived a long life. I also now know that living "well" affects the body positively, often with longevity as the by-product.

Eleven years ago I began working with cancer patients in support groups, utilizing a variety of mind-body healing techniques. I thought the groups were a place for me to teach people how to survive their difficulties and to improve the quality of their lives between office visits. I believed I had the answers, however I soon realized it was my patients who were the teachers. After several meetings it became evident that the group members were looking and feeling better. My wife Bobbie called them "exceptional patients," and the label stuck.

Forty years ago, Karl Menninger said,

> It is our duty as physicians to estimate probabilities and to discipline expectations; but leading away from probabilities there are paths of possibility, toward which it is also our duty to hold aloft the light, and the name of that light is hope.

Indeed I began to realize that hope was not statistical and that the future cannot be predicted for individuals.

As a physician and surgeon I realized I had never studied success. Medical practice, because of inadequacies in medical education, is aimed at keeping people from dying, but everyone dies. It is strange that medicine has never studied success. We have thousands of people who have gotten over incurable diseases, and we never ask why they didn't die according to their prognosis. I started asking the question, and the answers all sounded alike. There *is* something we can teach others to help them become exceptional and it *is* possible to share practical advice.

The common denominator of long-term survivors of AIDS,

cancer, and other life-threatening illnesses is that they take charge of their lives. Nursing and medical professionals however, usually classify them as "difficult" patients. They often ask too many questions and while in the hospital keep their clothes on, decorate their rooms, cruise the hallways, and in general, disturb the acceptable and standard routine. Since the word "patient" means a submissive sufferer, you can see why it is a bad sign to be a good patient. Exceptional patients are responsible participants in survival behavior. They accept their mortality but use it as a stimulus to grow and change. They say things like:

"I decided to experience unconditional love before I died."
"I decided to make every day precious."
"If you live in your heart, magic happens."
"I decided to die only once."
"If I die, who will finish the work of making the world beautiful?"
"I looked for someone to carry the torch (of hope) and I realized the job was mine."

They learned to live their lives.

In contrast to the exceptional patient, I've often heard comments like:

"I'll make this marriage work if it kills me."
"I hate my job and what I do each day."
"My life doesn't mean anything."

And I've seen what it does to them.

Dr. David Spiegel reported at the May 1989 Psychiatric Association meeting that one year of group therapy and autohypnotic techniques in women with advanced breast cancer doubled their survival time over a control group (36+ months to 18+ months).

Wil Garcia and George Melton are two exceptional AIDS patients. They share their story in *Beyond AIDS, A Journey Into Healing.* Wil, a computer scientist and George, a hair stylist, responded to their diagnosis of AIDS very differently. George shared his diagnosis with his clients and adopted a metaphysical path. He filled his life with love. Wil studied the immune system and science. His T-4 count went down, and George's went up. Eventually the scientist adopted the path of the stylist, and both are well and free of AIDS symptoms today.

We cannot separate the mind from the body. Emotions are chemical. It is important to understand that unexpressed feelings of despair and hopelessness lead the immune system to presume that we want to die. As physicians we must use the opportunity of a disease to help heal people's lives. Ask your patients to describe what they are experiencing. Listen for the metaphors in their answers, and help them see how they can apply them. A healed life may lead to a cured disease. Disease can be a gift if it heals a family or monster in someone who needs to express himself or herself.

For many reasons medicine has focused on its mechanical advances in this century and forgotten people. I don't deny or diminish the tremendous scientific advances of our era, but it is time we dealt with our feelings and realized that people are asking for care and healing, not necessarily cure.

I asked three young people - two with metastatic cancer, and the third with liver failure to due to cystic fibrosis - what they expected from the medical professional. They said, "Tell them to treat me like a person, knock on my door, let me talk first, say hello and goodbye, and look me in the eye." That doesn't seem like too much to ask. We are all capable of doing this, and the beauty of it is that when we help people heal their lives, a wonderful by-product may occur, namely a cured disease.

We produce winners when we lead people from "Why me?" to "Try me!" There are no failures, and guilt doesn't apply when we take on adversity instead of shirking it and when we honestly face our mortality.

As seven-and-a-half-year-old Jason Gaes said when dealing with his cancer, "Everybody's gotta die sometime." The problem is many of us die without ever living. Let us guide people through their personal hell, as Virgil did in Dante's *Inferno*, and lead them to life and healing. ■

When it comes to sports fitness, we're on the ball.

Accidents happen . . . a high, overhead lob, a missed step, a too-quick turn. At PT&SFA, we specialize in musculoskeletal injuries, back care and sports related injury. And, along with therapy, we have provided preventative care to the Maryland community for the past seventeen years with eight convenient locations.

So, whether you're an eighteen year old tennis pro, or an eighty-year old grandma, PT&SFA has your fitness in mind.

Integrating Traditional Medicine with Other Therapies in the Treatment of HIV-Infected Individuals

Charles L. Steinberg MD

Individuals affected by HIV have brought a high level of intelligence, assertiveness, and motivation to the exploration of new therapies. Much is being tried and learned outside the "traditional" medicine.

This article fills a gap in our total perspective by providing a summary of therapies our patients are doing in addition to what we prescribe. It is intended to inform physicians about these modalities not to present objective, scientific evidence about them.

Our knowledge has been enhanced by these therapies, for example, the active research on Chinese herbs as potential pharmacological agents and on the importance of nutrition, B-12, and folate deficiencies in HIV-1 positive individuals.

Perhaps this article will stimulate further research into some of these therapies and increase our awareness of others. Learning about such treatments may not only help our patients and the quality of their lives but also prevent them from harming themselves. *Editor*

A family physician and founder of Wellspring Partners in Health of Boulder, Colorado, Dr. Steinberg works extensively with people who have AIDS and HIV infection, integrating traditional and complimentary care. He is a leader in treating AIDS as a chronic manageable disease.

The AIDS epidemic has had a radical affect on all aspects of health care, ranging from many new understandings in the basic science of disease, new clinical approaches and pharmacologic agents, to unique social and political shifts, with much greater involvement of the individuals directly affected by the illness and with widely expanded social support efforts.

One part of this new and complex system has been the widescale use by HIV-positive individuals of alternative therapies usually not considered part of traditional medicine. Some of these are actually more "traditional," coming out of the long-standing traditions of Oriental medicine, nutritional medicine, and conventional wisdom. Some have emerged from the recent psychological and metaphysical "self-healing" or "holistic" approaches blended with the new scientific discoveries of the field of psychoneuroimmunology. These approaches often are labeled "complementary," implying these alternatives may be added with benefit to traditional methods. Finally, some therapies that may eventually be studied and incorporated by traditional medicine already are being used by patients outside of approved clinical trials. This article reviews the current use of complementary and experimental therapies in AIDS care and describes how they may best be integrated with standard medical practice.

Individuals affected by HIV, particularly the gay community, have brought a high level of intelligence, assertiveness, and motivation to the exploration of new therapies. There exists a never-before-seen network of communication and resource sharing in the form of newsletters, conferences, and word-of-mouth communication. There are underground "trials" of new agents, legitimate protocol monitoring of the effects of alternative therapies, and data banks recording information on large numbers of individuals using these therapies.[1] Much is being tried and learned outside the traditional system.

In part, this has been motivated by people seeing their illness progressing faster than is traditional medical research. In part there is a deep distrust of government researchers and authorities, the corporate profit motive, and the underlying homophobic prejudices in society. This is also coming from the direct experience of affected individuals involved in their own health care, understanding their disease, and exploring therapies. In this crisis of uncertainty and helplessness, individuals discover that becoming more involved can give a sense of dignity, power, and control. In the past health care providers have seen self-directing patients and their home therapies as problematic, introducing innumerable unknowns and potentially harmful agents into an already uncertain situation. Many are reframing their ideas of the optimal physician-patient relationship into one of partnership, where both doctor and patient provide ideas, information, resources, and judgment in a true collaborative effort.[2]

Complementary therapies generally are described as helping the body heal by "empowering inner healing mechanisms" that exist in the body. The common (but not necessarily true) distinction between complementary and traditional therapies holds that the former are more natural, more gentle, and more safe.[1]

Chinese Medicine

Chinese medicine is a unique 5,000-year-old system of viewing the body and of healing by use of acupuncture (needle stimulation of specific points on energy meridians), many herbs, as well as associated therapies. The emphasis is on treating the whole person, not just the specific disease, so that two different people with the same illness might have two very different treatment programs. The idea is to understand and then effect changes in the underlying constitution of the individual affected. Chinese medicine recognizes the vital role of diet, and although recommendations may vary for individuals, in general there are suggestions toward less dairy and less protein, with more whole grains and vegetables.

Acupuncture and Chinese herbs have had some effect in the specific relief of symptoms. Many HIV-positive individuals are bothered greatly by such general symptoms as itching, fevers, sweats, fatigue, and pain. Since each symptom can be seen as an imbalance in the total organism and be directly affected by acupuncture and herbal therapies, many individuals have obtained relief from them by using Chinese approaches when traditional medical approaches failed or in lieu of more toxic alternatives.[3] Chinese medicine takes many steps to strengthen the entire body, specifically the immune system. The gentle attitude of Chinese medicine also has proved quite helpful, bringing a high degree of respect for each individual and the idea of balancing all the forces affecting the person in healing. Finally, Chinese medicine has provided many specific herbs (such as the Chinese cucumber root) now being explored as potential pharmacologic agents.

Nutrition, Vitamins, and Supplements

It is a common-sense understanding of most people that what they eat will affect how they feel. Nutrition is seen as a way to maximize the health of the individual, enhancing vitality and well being. Nutrition also is seen as a way to shift the internal environment and make it less favorable for opportunistic infection. For example, fungal infections, particularly thrush, have been improved simply by lowering the sugar content in the diet. The nutritional guidelines proposed for AIDS patients include what most health care practitioners would consider common sense: adequate calories, vitamins, protein, and complex carbohydrates provided in regular meals each day.[4]

It is important to understand healthy nutrition in a context that extends beyond simply supplying optimal building blocks to the body. At a deeper level, how people shop for food, prepare their food, and feed themselves is an opportunity for individuals to demonstrate how they care for themselves. The usual barriers to providing optimum nutrition for AIDS patients often are not inadequate information but, more likely, deeper blocks to self-caring.

The specific vitamins and supplements being used in HIV therapies are shown in the chart.

The correct choice of nutritional supplements is a troublesome question and needs to be highly individualized. Some patients end up taking hundreds of dollars a month worth of supplements in a complex and difficult regimen creating a financial burden. Others manage with either none or a few capsules a day. In practice, the physician can advise a proper balance and with the patient's interest and motivation, help guide the degree to which nutritional supplements are used, if at all. Patients must be taught that nutritional supplements cannot overcome an inadequate or hastily thrown together diet. The bulk of essential nutritional building blocks will still come from regular, balanced meals.

Studies show that many HIV-related individuals have mild small intestinal malabsorption problems and are asymptomatic. Some patients have quite symptomatic diarrheal illnesses. In these cases, specific attention must be paid to providing nutrition

Chart. Vitamin, Mineral, and Herb Supplements

Vitamins Since the work of Pauling and Cathcart, vitamin C in large doses has been used as an antiviral drug. Individuals often take 10 to 20 grams a day of oral vitamin C and, in some, doses up to 80 or 100 grams a day have been used. The usual limiting factor on dose is the symptom of diarrhea, and the usual recommendation is for an individual to accelerate their dose until they experience diarrhea and then back off to approximately 80 percent of the "bowel tolerance" dose.[5] The evidence for the effectiveness of vitamin C in this illness is all anecdotal, although many individuals claim a lessening of their symptoms and less frequent infections. A logical conclusion at this time seems to be that if someone is interested in taking vitamins, vitamin C in the dose of 6 to 12 grams a day many be helpful and has not been shown to be harmful. The use of intravenous vitamin C in high doses seems too invasive and difficult, although it does have a few supporters.[6]

Most individuals who use vitamin therapies also take a multiple vitamin with a B complex supplement. This is based on the idea that even with good nutrition, it is impossible to be sure all vitamins have been obtained in adequate doses, depending on where products were grown and soil composition. Particular attention has been paid to vitamin B12 and folate levels because of the macrocytic anemia that develops with AZT therapy. Frequently, levels of these two vitamins are checked and appropriate therapy instituted.

Minerals Similarly, a question has been raised about adequate levels of certain minerals in the diet. It has been documented that HIV-infected individuals may be deficient in zinc, and zinc supplements at the dose of 100 to 200 mg per day currently are recommended.[7] Selenium, a mineral that should be available in green, leafy vegetables, can be deficient when the soil where the vegetables are grown has been depleted. Selenium is taken in doses of 100 to 200 micrograms per day because milligram doses have been shown to be toxic. This is an example of how the knowledge and vigilance of physicians prevents harm.

Herbs Many medicinal herbs are being used by HIV-infected individuals. One group includes echinacea, shitake mushrooms, and astragalus. All these contain high molecular weight polysaccharides, which may cause an increase in macrophage an lymphocyte function.[8] They have been used for centuries in folklore medicine for their antiviral properties. Garlic used both in its raw form as well as in capsules is touted to have antibacterial effect. PauDArco is a Brazilian herb that is made into a tea and said to have antifungal effects. These herbs usually are used in a daily form of prophylaxis to prevent infection and are not thought of as strong enough for primary treatment.

A newer herb that has been explored and described extensively in the AIDS treatment newsletters is St. John's Wort. This common plant contains hypericin and pseudohypericin, which have, in studies presented at the 1989 Montreal AIDS conference, been shown to have *in vitro* antiretroviral effect.[9] Reports indicate that it is safe to combine with AZT, and monitoring studies are now ongoing to measure its effect. St. John's Wort is also known to be an antidepressant. There is some concern about its toxicity both as a photosensitizer and as a potential elevator of liver enzymes. Finally, there is the unknown potential problem of its combination with other antidepressants some patients may be taking.

A product harvested from the surface of lakes and oceans, blue-green algae, is also being used by many HIV-positive individuals. It is a complex substance that contains amino acids, minerals, and other organic compounds. Its recommended use is as a boost in energy for chronic fatigue. Many patients report this effect. It has been used by some to help correct the anemia induced by AZT. Recently it has been shown at the National Cancer Institute to also have, in itself, antiretroviral properties.[10]

and supplements in a manner that will maximize absorption. For example, patients with undesirable weight loss have sometimes been helped with predigested amino acid supplements, such as Vivonex and Ultrabalance protein powder. Similarly, the lactose in milk products frequently is not tolerated, and some individuals will need to be on a milk-free diet or take lactase supplements.

When paying such detailed attention to the nutritional substances an individual consumes, it is equally important to attend to avoidance of harmful substances and substance abuse. A recent report that drug and alcohol use did not affect immune function belies our clinical experience that cessation of alcohol abuse, marijuana, cocaine, and other drug use leads to improved immune function as well as improved overall health.[11] In particular, since alcohol is toxic to the liver and marijuana harmful to the lungs as well as possibly to T-4 cells and since these are primarily affected in HIV-related illnesses, it makes sense to help a patient deal with drug-abuse problems. Substance abuse is a significant barrier in emotional and interpersonal well-being and can limit an individual's ability to cope well with the impact of HIV illness.

Physical Exercise

Vigorous aerobic physical exercise is an essential part of keeping the human organism healthy: it has the obvious effect of strengthening the musculoskeletal, cardiovascular, and respiratory systems, and there is some evidence that it may improve immune function and T-4 cell counts.[12,13] For most individuals, it offers an opportunity to expand the accumulated muscular tension from everyday stresses and provides elevated endorphin levels, a natural antidepressant. Many forms of physical exercise also provide opportunity for fun and social interaction. Creating an optimal exercise program requires more than just information. It is an opportunity for an individual to experience self-love and will work best when an individual finds a program he or she truly enjoys.

Massage and Other Touch Therapies

Massage is an ancient healing art now quite popular. In many centers of the epidemic, there are extensive massage programs for AIDS patients. At the physical level, massage provides relaxation and a heightened sense of well-being and improved circulation of blood and lymphatics. The edema that developes secondary to Kaposi's sarcoma can respond to massage therapy.

Massage often affects people in a deep and personal way. During a massage, an individual's attention is often directed inward, where he or she may discover patterns of holding stress or areas of inner discomfort. The relationship that develops with a massage therapist also can be healing. For many individuals, it is the unique experience of *being touched* after developing an "untouchable" disease. For many, the emotion-

al issues of isolation, loneliness, guilt, and shame may be dealt with as a result of this inner experience during massage.

Support Groups

The use of support groups for chronic illness did not begin with HIV and previously has been demonstrated effective in groups for patients with cancer, Alzheimer's disease, multiple sclerosis, herpes, alcoholism, among others.[14] Individuals coming to a support group initially receive help with their feelings of shock and denial as they deal with being given an HIV-positive diagnosis. They often encounter living proof of others who are surviving and thriving. Here is a forum for sharing new information on treatments and resources, as well as a time to do active problem solving. Individuals build a support network that extends outside of the group and helps meet emotional needs as well as daily needs for such things as food, transportation, housing, and jobs. All this occurs in a context of talking through the difficult issues for someone who is HIV-infected: fears and hopes, who and when to tell, family relationships, dating, sex and love, and philosophical questions about the meanings of life and death. Such groups also provide time for healing activities together, such as singing, meditating, the use of imagery, as well as outside recreational activities, sports, and camping trips.

Psychological and Metaphysical Approaches

Much of the work done to improve the life and care of the HIV-affected individual has been done in the psychological and spiritual realm. The books and tapes of Dr. Bernie Siegel, Dr. Elisabeth Kubler-Ross, Dr. Carl Simonton, Dr. Gerald Jampolsky, and Louise Hay have been widely read in the AIDS community.[15-23] These approaches attempt to offer an individual answers in his or her search for inner peace, joy, love, spiritual growth, and connectedness with others. Whether these approaches provide simply a better attitude or directly affect the immune system awaits further studies by psychoneuroimmunologists.

Integration

How can a physician, other health care provider, or a person living with HIV sort through this array of therapies? How can this all be integrated with standard medical practice? It is not easy. It takes commitment, dedication, and support in an ongoing way. There are some real dilemmas in creating an optimal healing plan. The following are some general guidelines for integrating complementary therapies with traditional medical practice.

Finding the right balance If a patient were to follow all the above therapies, he or she would be focusing most of his/her time on the HIV infection. Reading newsletters; going to conferences; making appointments; going to support groups; listening to tapes; taking medicines, supplements, and herbs; eating healthy meals; doing physical exercise, meditation, imagery, and relaxation techniques; and seeing alternative therapists would constitute a full-time job. There is also the agenda of attending to life's regular daily activities, visiting friends, and doing the laundry. Each individual, in partnership with his/her health care provider must find the right balance between life's regular moments and the various aspects of their healing plan.

When a person living with HIV wakes up and notices a new minor symptom, the same balancing question arises. The monologue that a person with AIDS may go through in deciding whether to call a health care provider is intense. "This is nothing to bother the doctor about; I'm sure I'll be fine. My higher intuition says I'm fine. Or maybe that's just my denial . . . maybe I'm not worth the care. If I call him, maybe he'll think I'm a hypochondriac." The best interventions are with early diagnosis and treatment, so for this balancing question it is best to encourage a patient to call with any new symptoms.

Dealing with uncertainty Individuals affected with HIV and their health care providers need to acknowledge that creating an optimal health plan is dealing with uncertainty. Every few weeks there is new information to guide choices, thus treatment plans need constant revision. Frequently a physician must decide how intensively to work up an individual's early symptoms. There are no clear-cut algorithms for this difficult question. It is appropriate to combine one's best medical judgment with the patient's and family's wishes, as well as the intuition of all involved. The art of medicine is as important here as is the science of medicine. The physician-patient relationship is comforting and healing in all illnesses, especially this one.

Anger There is much anger in the world of AIDS. Individuals have lost their jobs, their homes, and their support systems because of this diagnosis. Government agencies have been slow to respond, and the pharmaceutical industry has created therapies that are unaffordable. Many people have experienced great personal loss.

Anger is a healthy and normal feeling in this situation. Expressing anger can be healthy; holding in anger can be hard on one's psychological well-being. Many activist groups have arisen, and protests and marches are frequent. However, holding on to anger, expressing it again and again, can have a detrimental effect on one's enjoyment of life. Finding the balance between appropriate expression of anger and then moving to the work ahead is an essential part of AIDS care.

Nonexclusivity Often the question is heard from a patient, "Should I follow the medical recommendations or use alternatives I've read about?" The "or" in this question implies that these approaches are mutually exclusive. This is an artificial separation. Frequently physicians without knowledge in alterna-

tive areas discourage their use simply because they are unfamiliar with the specific modality mentioned. Similarly, practitioners of alternative therapies often downplay the importance of traditional medical care or discourage its use as toxic or unnatural. Individual practitioners' egos and their defensiveness need not create an artificial barrier to combining therapies. The best approach is to use common sense and whatever information is available in a nonexclusive fashion to combine different modalities into an optimal health plan.

For example, the opportunistic infections caused by the herpes simplex and herpes zoster virus traditionally are treated with acyclovir. There is, however, no harm in combining this with the known nutritional benefit of selenium as well as the amino acid lysine. Similarly, while Pneumocystis pneumonia needs to be treated with pharmacologic agents, smoking cessation is an obvious complementary therapy.

A better example might be insomnia, which is a frequent symptom of the HIV-affected individual. The insomnia comes not only from the multiple stresses created by this illness but also in some people as a side effect of AZT, as well as a result of nighttime symptoms of fevers, sweats, and itching. Probably the last therapy to be used for insomnia should be the benzodiazepine class of hypnotics. They frequently result in sedation and memory loss reminiscent of dementia. Many alternative therapies for insomnia exist, including the nutritional supplements of camomile tea, volarian root and tryptophan. (The latter, used on many detox wards, is a good example of the traditional learning from the complimentary.) Similarly, a regular sleep schedule, a daily exercise program, and a diet that omits caffeine and sweets can be helpful in sleep induction. Both massage and acupuncture have helped treat insomnia. The use of relaxation and sleep-induction tapes have been quite helpful. A last example of this principal of nonexclusivity comes from a particular patient with Kaposi's sarcoma who participated in the early NIH trials of combination interferon and AZT therapy. The researchers, curious as to why this patient had particularly fewer side effects compared to his cohorts, were surprised to find that most of the patient's side effects were being relieved by weekly acupuncture treatments.

Responsibility The most popular jargon in complementary therapies is to encourage an individual to "take responsibility" for his/her health care. While this speaks favorably to becoming fully involved and active in one's healing, it frequently is construed by the individual that he or she isn't doing something correctly. Feeling blamed and guilty because one is ill is not conducive to well-being. Self-responsibility is meant to direct an individual toward active involvement, self-education, and making choices while working in partnership with the health care provider. There is no room for self-recrimination, guilt or blame in any area of true healing.

Empowerment The newer model of the physician-patient relationship as a partnership is quite empowering to the individual who is ill. It is part of the above-discussed responsibility issue. The health care provider needs to look at what choices and actions tend to give more of a sense of power to the affected individual. Since being ill, needing therapies, and being in the hospital are disempowering, the path to health requires conscious effort toward empowerment. If individuals can gain the sense that the choices and actions they make will influence what will happen to them, they will tend to feel better about their health care.

The well-documented but poorly understood placebo effect can be seen as an example of the role of empowerment. When an individual believes that a treatment or therapy he or she is using is effective, that by itself can add greatly to its effectiveness. AIDS underground therapies, such as dextran sulfate and AL-721, were believed in and experienced by many individuals to be quite helpful. When later research proved these therapies to be ineffective, individuals experienced a recurrence of symptoms.[23] The best approach is to consciously use the placebo effect in every therapy for the patient's well-being. What this really means is to tap the inner healing ability of the individual's body with direct support toward that individual's empowerment. Similarly, if a patient's beliefs are such that a specific therapy is seen to be harmful, the enforced use of that therapy may well lead to early toxicity. As an example, many AIDS patients' attitudes about AZT have presaged their adverse outcome with this therapy.

Hopefulness Since the beginning of the AIDS epidemic, it has been shrouded in a shadow of doom and gloom. Early in the epidemic there were many undocumentable predictions that all who seroconverted eventually would develop AIDS and all AIDS patients eventually would die.

Now there are long-term survivors, and there are individuals who are in remission. There is, in traditional medical teaching, the maxim that it is unfair to give false hope to a patient. While this is true, in a disease that is being studied so intensively, with new therapies developing rapidly, there is great room for offering optimism to patients. For many, hope becomes a choice rather than a logical conclusion. It is the ancient dilemma of whether one sees half a glass of water as half full or half empty. The quality of life for many HIV-infected individuals has been greatly improved by choosing hope. Optimism is an essential element in empowerment.

At this moment in the epidemic, there is much to be optimistic about. Standard therapies such as AZT and Pneumocystis prophylaxis are adding years to the life expectancy of AIDS patients.[24] Earlier use of antiviral therapies is becoming more widespread, and the release of newer agents is imminent. Protocols to monitor and evaluate the efficacy of many of the above-discussed alternative therapies are in place. HIV-related illness is being seen by more physicians

and patients as a chronic infectious disease that can be managed.

Finally, the deep personal healing that many AIDS patients have experienced and the new models of healing envisioned by many AIDS health care providers give us much to be hopeful about. Truly we can all combine our efforts and enable people to live long and live well with AIDS and HIV infection.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service.
1211 Cathedral St., Baltimore, MD 21201
Telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Living Long and Living Well: The Role of the Physician's Attitude

Donald M. Pachuta MD

Dr. Pachuta, a practitioner in internal medicine and infectious diseases in Baltimore, organized and created two international conferences devoted to making living long and living well with AIDS and HIV-1 infection an idea whose time has come.

As caregivers we need to examine and perhaps challenge our attitudes and beliefs, to stimulate discussion of new therapeutic strategies, and to consider what we can do individually and collectively to help combat the epidemic of HIV-1 infection. To do this, I have asked a series of questions (at times in this epidemic we've asked the wrong questions) and will attempt to answer them, perhaps in ways different from what you have heard or read or from the commonly held beliefs in medicine and society.

In preparing this article, I talked to some of the authors quoted in the references. It is clear that some of them (like myself), looking at the same data, view the cup as half full. We have been disappointed at how many of our colleagues have seen the same cup as half empty.

"AIDS does not inevitably lead to death, especially if you suppress the cofactors that support the disease. It's very important to tell this to people who are infected. Psychological factors are critical in supporting immune function. If you suppress this psychological support by telling someone he's condemned to die, your words alone will have condemned him. It simply isn't true that the virus is one hundred percent fatal. If you lead a normal life - sleep regularly at night, avoid alcohol, coffee, and tobacco - your immune system could perhaps resist the disease for ten or fifteen years. By then we might have found an effective therapy. The CDC statistics are biased. They're based on a single homosexual population (San Francisco) with a lot of cofactors aiding the disease."

Luc Montagnier MD

Does everyone exposed to human immunodeficiency virus type 1 (HIV-1) become infected? Although most people answer this question affirmatively, the true answer is a resounding **NO**. I am continually surprised by people who test seronegative despite many exposures.

Dr. Luc Montagnier, co-discoverer of the AIDS virus and a Nobel Prize candidate, says:

> The AIDS virus plays the role of a lion hunting a troop of gazelles. It will bring down only the weakest among them.... The virus searches for favorable terrain in which to establish itself. It creates an epidemic in territory already prepared by the cofactors.... Not only the establishment of the virus but also its transmission is aided by these cofactors.... The fact that someone becomes seropositive for AIDS might itself be associated with cofactors. It's not easy to become seropositive.[1]

Dr. Robert Gallo, the other co-discoverer of the AIDS virus, and also a Nobel Prize candidate, agrees.[2] They and other authors[3-5] discuss multiple strains of HIV-1 with differences in infectivity and virulence as well as host response and cofactors.

In Los Angeles, Imagawa and his colleagues studied 133 homosexual men (selected because they continued to engage in sexual activities that put them at very high risk for HIV-1 infection) who tested antibody negative.[3] Only 31 (23 percent) of these

men grew HIV-1 on culture, and 27 remained seronegative up to 36 months.

This study raises some doubt about the definition of HIV-1 infection. The authors conclude that a prolonged period of latency may be much more common than previously realized. They suggest that some people may harbor this virus and never seroconvert or never get ill. They also point out that it is possible for an individual to be infected more than once with different strains of HIV-1 but only seroconvert with a strain competent to replicate (replication in blood is thought to stimulate antibody production). The four men in their study who seroconverted may well have converted from reinfection with a different strain of virus than the original positive culture. At this point there is no way to tell the percentage of HIV-1 infection that does not stimulate measurable antibody. In the future, the routine measurement of provirus particles will help.

These investigations raise some very important questions. If HIV-1 is in a latent state, what activates it to replicate in blood, as well as what stimulates it in asymptomatic seropositive individuals to produce the clinical disease AIDS? Despite very-high risk sexual behavior 77 percent of these men remained antibody and HIV-1 culture negative. Dr. William Haseltine calls it "good news" that the "replication of HIV-1 may be spontaneously suppressed by a combination of cellular, viral, and immune mechanisms in far more people than have been supposed."[4] He further states it is therefore possible to suppress the expression of the virus with drugs and induce a prolonged remission of viremia in seropositive patients, and that such treatment-induced remissions would be very good news indeed. Furthermore, immunocellular mechanisms might control the infection for a period of time without continued treatment.

These authors may have demonstrated for the first time in the AIDS epidemic a true carrier state whereby an individual with an organism is apparently not harmed, although the degree of infectivity or transmissibility is unknown.

Transfusion Data

We would expect virtually 100 percent infection in blood transfusions because of a rather massive intravenous dose of virus. Yet this is not the case. Cumming *et al.*, while demonstrating an increasing risk in relation to the number of random donors and total units of blood or blood products, nevertheless comment on the "less than 100% efficiency of transmission."[6]

Ward and associates investigated the natural history of transfusion associated infection with HIV-1.[7] Many people quote this report to show a 95 percent incidence of HIV-1 infection from blood transfusions. Even if that is true, 5 percent of the people directly transfused with this virus did not become seropositive and somehow cleared it with their own immune system. That this is even possible has not been emphasized.

Let us examine the origin of the 95 percent figure. In this epidemic, many important statements have been made from tiny numbers. Of 765 recipients transfused with blood components from HIV-1 positive donors, 694 with medical records were entered in the study. Of these 694 patients 437 (63 percent) had died, 16 of whom had been HIV-1 seropositive or had AIDS. Of the 257 living recipients, 203 were evaluated for HIV-1 infection and 119 (59 percent) were HIV-1 seropositive or had AIDS. The seronegatives were not included in the statistics because of uncertainty about donor status when they received blood. (They could have been transfused when the donors were still antibody negative or when they had no virus in their blood. Their exclusion is a mystery since one might expect a random distribution. Including even a few of these patients would drastically lower the 95 percent figure.) One thing clear from this study is that the worst risk factor in the recipients was the time that the donor developed AIDS. The sooner the donor developed AIDS after the donation the more likely and faster the recipient would do the same. Beginning with 694 patients this study ended with only 38 living recipients of blood from donors who had earlier donated to recipients who became HIV-1 seropositive included. Of these, 36 (or 95 percent) were HIV-1 seropositive or had AIDS. It is clear that not every transfusion recipient got HIV-1 infection from contaminated blood. In this study only 119 of 203 living recipients (**59 percent**) were HIV-1 positive or had AIDS.

The data on health professionals is well known. The statistical risk of contracting HIV-1 infection from needle stick and other exposures is between 0.1 and 0.5 percent per exposure. However, in those health care workers who are seropositive, the infection was clearly related to the depth of penetration as well as size of inoculum. There has been no HIV-1 transmission to a surgeon or other physician doing invasive procedures (or from a doctor to a patient) despite numerous needle sticks, splashes of blood, and secretions.

Why doesn't everyone exposed to HIV-1 become infected? Perhaps the "favorable terrain" plays a role. Who are "the weakest?" When investigators discuss cofactors, they usually confine themselves to biological ones, for example, other viruses. Chaisson *et al.* identified cocaine use as a risk factor for HIV-1 infection in IV drug users,[8] and Dr. Stanley Weiss discusses the paramount importance of this study in an accompanying editorial.[9] Dr. Montagnier, Dr. Gallo, and many other distinguished scientists believe psychological factors are major cofactors, not only in susceptibility to infection with the virus but also in the development of AIDS once infected.

The role of other possible psychological, emotional and chemical cofactors (stress, fear, the effects of alcohol, cigarette smoking, and recreational drugs) has been all but ignored despite our knowledge about their immunosuppressive effects.

Garry *et al.*, documenting an AIDS virus infection in the United States in 1968, raises a great many questions about the spread of the epidemic.[10] Dr. Montagnier says that this and other retroviruses have been around a long time and that it is not the virus that has changed its basic configuration over the years but the behavior of its host.[1] Dr. Gallo likewise agrees on the importance of cofactors accelerating not only initial infection but also progression to AIDS.[2] We would do well to embark on research studies investigating these various cofactors, but more important, we should make this part of our daily conversation as we practice medicine.

Is everyone infected with HIV-1 destined to get AIDS? Again most people will answer yes, but that is not fact; at best it is a hypothesis or a projection and a classic example of half-full and half-empty cups. Based on everything discussed so far and below, the answer should be an emphatic **NO**. Dr. Gallo believes that present evidence shows a minority of HIV-1 infected individuals develop AIDS, and this is what we should be telling people. He says we have no evidence that all HIV-1 infected persons develop AIDS and that studies on the effect of altering cofactors are lacking. He further states that the true answer to many of these questions may be "I don't know" and that we should only say what we know for sure. He strongly believes that we as scientists should not make statements of prediction without proof. He reminds us that the definition of AIDS is man-made by CDC.

All of the projections are based on an extremely biased cohort from San Francisco (studied because the time of HIV-1 seroconversion was fairly well approximated). Not knowing they were infected, this group of men did not alter their sexual behavior or lifestyle for several years. They continued to engage in high-risk sexual behavior, a high-paced lifestyle including alcohol, smoking, and recreational drugs, which did not help their immune system. Despite all this, at the end of ten years *only a minority of these individuals have developed AIDS.* We should be shouting this good news to the whole world and to each patient we see. If only 48 percent of these individuals developed AIDS after a decade of being HIV-1 seropositive, without early change in behavior, the possibilities are legion of altering the outcome considerably by changing attitude, lifestyles, and behaviors.

It is our duty to emphasize the fact that the majority of these individuals (52 percent) do not have AIDS after ten years. Other data also show promise. In the study of Ward *et al.* life-table analysis "suggested" AIDS will develop in 49 percent of infected transfusion recipients within seven years after infection.[7] Dr. Jay Menitove remarks that this is considerably longer than any previous estimate.[11]

The data in hemophiliacs is even more encouraging. Eyster *et al.* in a study of predictive markers in hemophiliac patients found an actuarial cumulative incidence of AIDS of only 26 percent eight years after antibody seroconversion.[12]

The study by Goedert *et al.* is the first to use statistical estimates that do not depend on the assumption that AIDS will eventually develop in all infected persons.[5]

These investigators show that the annual incidence of AIDS during the *eighth year after seroconversion was only 7 percent* and that the actuarial cumulative incidences of AIDS *nine years* after HIV-1 infection is *only 25.1 percent.* Further these authors showed a marked difference with age, so that for children and teenagers, the cumulative incidences after *eight years was only 13.3 percent* and *26.8 percent for people ages 18 to 34.* Unfortunately, there was a higher incidence of 43.7 percent for people ages 35 to 70. They concluded that we need to identify the reasons for the relatively long-term AIDS-free survival. They asked some very important questions: for example, how do children and adolescents control HIV-1 replication for relatively long periods? This subgroup had a substantially lower incidence of AIDS even though they lost the antibody P24 antigen (which usually correlates with the onset of AIDS but didn't here), suggesting much better tolerance of replicating HIV-1. They likewise concluded that basic mechanisms that exist to control the virus or limit its damage may be operative. They point out that children, adolescents, and younger adults may tolerate severe immune deficiency better because they have fewer other infections or because of some unmeasured age-dependent cofactor or immune alterations later in the disease.

Their study overlooks some basic issues such as the fact that the children and adolescents are much less likely to smoke, drink alcohol, use cocaine, nitrates (poppers), and other recreational drugs, lead a fast-paced life, engage in high-risk sexual behavior, and that young adults, even while doing some of these activities, may not have done them long enough to show damage from them. Ranki *et al.*[13] proposed a long latency preceding seroconversion as mentioned in the study of Imagawa *et al.* [3] This and the long time it takes to develop AIDS after seroconversion (for those who do) have profound implications for the prevention of AIDS in people with HIV-1 infection.

One great tragedy of this epidemic is that so many HIV-1 positive people are told by a physician (sometimes over the telephone) that it is a death sentence. Physicians' words have condemned them. This is despite an average AIDS onset of more than 10 years after HIV-1 infection and Dr. Montagnier's statement that one can live 10 to 15 years with the disease AIDS by controlling cofactors. No test is ever a death sentence.

I have seen many individuals get sick after hearing such news and even a few develop acute *pneumocystis carinii* pneumonia. We should be telling all these patients that the odds are that in ten years after seroconversion, they will not have AIDS. We should be asking them what they would like to do for the next ten years or more of their lives.

The real question for HIV-1 infected individuals should be: What can be done mentally, physically,

emotionally, and spiritually not to get AIDS over the next 5, 10, or 50 years? My initial conversation with these patients starts with this question and includes discussions of attitudes, nutrition, sleep, exercise, lifestyle, stress, fear, anger, guilt, spirituality, and optimism to plan for the future. I talk frankly about alterations in sexual or drug behavior. I refer them to group or psychological support and to complementary therapies that work. Above all I encourage people to continue working and living life. Life is much more important than death. What do we have to gain by our pessimism?

Does everyone with AIDS inevitably die of it? The answer is a resounding **NO**. Once again the co-discoverers of the AIDS virus are in agreement. Dr. Montagnier's quote at the beginning of this article speaks for itself. Dr. Gallo says that no microbe is 100 percent fatal – not tuberculosis, the great plague, smallpox, nor the great pox (syphilis).

However, in both medical and other literature, we constantly hear words like "deadly," "grim," "hopeless," and dozens of other extremely negative words. If something is repeated again and again, it becomes truth for you. One need only to read literature from concentration camps survivors[14] to appreciate this point.

Dr. Gallo says that predicting a 100 percent mortality rate is unscientific and causes a sense of hopelessness, giving up, depression, and even suicide.[2] Dr. George Engel wrote on the giving-up/given-up complex and its role in disease and mortality.[15,16] All of us know the value of a fighting spirit in our patients. Why do we take it away so often in this epidemic?

Could our fatalistic attitude create disease and spread the epidemic? Too many patients continue to engage in high-risk behavior. Their attitude is that since they were told they were going to die anyway they might as well enjoy themselves and live it up.

Before predicting, we should realize there is a difference in pathogenicity between HIV-1, HIV-2, and HTLV-1. Both co-discoverers of the HIV-1 say there are variations of the HIV-1 virus.[1,2] HIV-2 has been found in 80-year-old former prostitutes; clearly they have had it for a long time. It does not appear to be virulent, just as HTLV-1 does not appear to cause a lot of leukemia. So too, there may be a great difference in the virulence and pathogenicity of *different* strains of HIV-1. How can we know which strain our patient has just from the antibody test?

I (as well as Dr. Gallo and others) have seen dozens of long-term AIDS survivors who are alive and well. Some of them have had it since the beginning of the epidemic. I met a man who was sent home to die in a few months with AIDS and progressive multifocal leukoencephalopathy (PML). He had dementia, was nearly blind, and could barely walk and talk. He is completely well nearly five years later. When he went home to die, all his mother did was love him; apparently that stimulated his immune system. No one has survived PML with AIDS for more than a few months, but here is an outstanding example. He had to plead with physicians to be studied by researchers. He persisted, and eventually his case was published.[17]

Lon Nungesser, author of two books,[18,19] was given a death sentence in 1983 because of 14 Kaposi's sarcomas on his body. He is alive and well with no lesions, no illness, and with no traditional medical therapy. He says,

> A diagnosis is an event to be adapted to, not a death sentence to be compliant with. I have offended a lot of doctors being alive. Now they are starting to call me and ask for my advice.[19]

Other long-term survivors of AIDS or advanced AIDS related complex (ARC) have written books that are quite inspiring.[20] The book by George Melton and Wil Garcia[21] is something I give every new patient with HIV-1 infection.

I have met three people diagnosed with ARC who are not only asymptomatic years later but have reverted the HIV-1 antibody test from positive to negative. Again these people hounded their doctors to study them and gave up in frustration that no one was interested. (There is one other study of antibody reversion in the literature, but the significance in those patients was not known at the time.[22])

The most dramatic evidence that there is something more than the virus in operation took place in Washington, DC in February 1989. Nine long-term survivors of AIDS participated on a panel at a conference, Defying the Odds. Living Long and Living Well - A Case For Optimism. Each used *different* therapies. Some were taking traditional medications such as AZT and acyclovir. Others took medication that is considered ineffective, such as dextran sulphate, while some only practiced guided imagery, nutrition, or spiritual work. The audience of over 600 people was especially moved listening to the feisty, fighting spirit of one woman with transfusion-induced AIDS (after conquering stage IV, Hodgkins' Disease) and a T-4 count of 2.

There is also a drastic difference in mortality rate between the east and west coasts of the United States. In Maryland the median survival time of AIDS is approximately 42 weeks; in California it is several times greater. What the people on this panel of long-term survivors and most people on the west coast have in common is taking charge of their disease and not being victims watching their T-4 count drop, waiting to get sick or die.

Does the T-4 (CD-4) cell count determine what happens to you or your immune system or do you determine what happens to your cell count as well as to your immune system? It is almost scientific dogma that the T-4 (CD-4) count determines the outcome of an individual's health, life, and progression to AIDS. However, there are no dogmas in medicine.

The study of Eyster *et al.* points out the nonspecificity of the T-4 count because many infected

individuals with low T-4 counts do not develop AIDS within the next two years.[13] However, since the data first became available from the study of Masur *et al.*[23] the T-4 count has been held with fervor as a predictor of AIDS in people who are HIV-1 seropositive and had T-4 counts under 200. Their data is widely quoted, has been widely acted upon, and yet it demonstrates that after 18 months *only one third* of the patients who were HIV-1 seropositive developed PCP. Again the cup is half full or half empty. Fully *two thirds of the patients do not develop PCP* within a year and a half. Would it not be better to try to identify which third and what other factors or cofactors may contribute to progression to AIDS? Again, none of these studies were controlled for sexual behavior, smoking, drug use, alcohol intake, etc.

As we rush to "do something" in an epidemic that we ourselves have declared hopeless, are we exposing everyone to significant short-term toxicity, the risk of viral resistance, and possible long-term toxicity to prevent the one third from developing PCP? Would preventing PCP by means other than AZT suffice? Dr. Masur has pointed out the extensive use of aerosol pentamidine despite the paucity of carefully analyzed and published data about its long-term efficacy and toxicity.[24]

We haven't questioned why there is such a tremendous mortality rate of PCP in people with HIV-1 infection (anywhere from 20 to 40 percent in the first episode and 1.5 to 2 times greater in subsequent episodes). The PCP mortality is far less in cancer patients with profound leukopenia after chemotherapy. Could it be they simply do not have a belief system that they are supposed to die, and and therefore they don't? I have seen a number of patients with single digit T-4 counts who are perfectly well. I have seen many more with T-4 counts under 50 who are likewise perfectly well. Obviously, patients who have counts of two, four, or seven T-4 cells per cubic millimeter and are perfectly well are operating their immune system in some way different from what we expect. Dr. Bernie Siegel discusses a patient who clinically improved while the T-4 count dropped.[25]

Again in our rush to do "something," many physicians have adopted as scientific the NIH data on AZT prophylaxis in asymptomatic HIV-1 seropositive men. This data has not heretofore been published in another medical journal for appropriate peer review. That is acknowledged by Bartlett (p. 150), Chaisson (p. 156), and Zurlo and Lane (p.161). They and other authors[24] urge caution until these data are published and even more caution in patients whose T-4 count is above 300. Indeed Masur *et al.* found only 2 of 100 patients with a serious opportunistic pneumonia at a time when the T-4 count was greater than 200.[23] Furthermore, it is difficult to do a placebo vs. AZT study because subjects taking AZT know they are on the drug. The Heisenberg principle of uncertainty states that the observer is always part of the experiment.

Yet, despite what is only a newspaper report at present, physicians throughout the country are rushing to prescribe AZT and are excited because these studies presumably showed no toxicity at a lower dose of 500 mgm per day. We are acting as though we have found the cure.

In addition to the long-term toxicity of AZT, which has not been studied in this group, the down side described by the above authors is the potential for viral resistance. There is also enormous expense involved. We may be using this drug too freely at a time when we should be reserving it for its clear benefit on mortality in patients diagnosed with AIDS. Initially it was thought that the survival benefits were exhausted with long-term AZT therapy of AIDS, but a recent study by Fischl *et al.* has demonstrated continued survival benefits.[26]

The above studies are not without controversy.[27,28] Dr. Bartlett has written several reasons not to rush to adopt this therapy (p. 154).

Once again we are making major determinants of public policy, treating patients, planning enormous expenditures of funds based on very tiny numbers. Is it possible we are treating this disease differently from others? Does holding AIDS as uniformally fatal cloud our usual scientific scrutiny? Have we rushed our research process at the risk of true scientific data? Have we bowed to pressure from the public to do so? In our quest for a "magic bullet" have we forgotten our role in educating patients and practicing the art of medicine with people?

Are we treating our own anxieties?

Do the mind, emotions, and spirit affect the body? We know from personal experience the answer to this question is yes, whether or not it can be demonstrated in a double-blind controlled study. The psychiatric literature from Freud to the present day are replete with that information. Carl Jung said that all illness from young adulthood onward is illness of the spirit and we must treat the spirit if we are to affect the illness.

We are aware of the power of the placebo. Dr. Eugene Brody expressed it best when he said, "Every pill prescribed by a physician has his or her signature on it."[29] We need to look at the ways in which that happens and how we and the patient might intervene. We have a long heritage of this in Western medicine and in the 5,000-year-old systems of oriental medicine.

Does the attitude of the physician, care giver, or society as a whole affect the infectivity and the progression from HIV-1 seropositive to the clinical disease AIDS? Clearly, attitudes of caregivers affect patients. Dr. Bernie Siegel has documented numerous cases of this in his two best selling books.[25,30]

It is sad that many patients with cancer and HIV-1 infection are totally depressed and ready to die when they need not. All too many patients die on cue. A patient was told by a physician that he would go into a coma in two months, go downhill, and die. Despite the fact that he responded well to chemotherapy and radia-

tion and was mowing his lawn two days before, when that two-month anniversary came, he did exactly as he was told. Siegel says this occurs with 15 to 20 percent of cancer patients.[25]

The attitude of the medical and scientific community and society at large toward this epidemic has been negative.

In 1984 an Assistant Surgeon General talked about two epidemics - AIDS and fear. He said that at some point we will get a handle on the epidemic of AIDS but wasn't so sure that we would ever get a handle on the epidemic of fear. Indeed, fear is a major aggravating factor in this epidemic. The prize winning article in Medical Economics this year was "How many patients will die because we fear AIDS."[33]

Physicians seldom discuss emotions, attitude, lifestyle, diet, sleep, exercise, alcohol, tobacco, caffeine, recreational and other drugs, etc. with cancer and HIV-1 patients. Certainly the attitude of the physician and the patient effect the outcome in all diseases.

The problems of physicians in this epidemic, discussed in a number of papers, include fear, homophobia, hopelessness, dislike of the patient population, ethical and moral dilemmas, lack of education, and discrimination.[31-33]

We have come a long way since I took care of my first patient who died of AIDS: there was not a funeral director available in this state who would bury the man. However, we have a long way to go. In *Patient Care*[34] Dr. William Schlotterer discusses his journey in caring for people with AIDS in his community. He talks about his struggle with his fears and the fears of his wife, his decision to treat people with HIV-1 infection and taking over 150 hours of continuing medical education on issues relating to AIDS, including a month at the AIDS Provider Education Experience at San Francisco General Hospital Medical Center. He has cared for approximately 45 HIV-1 infected patients since 1984, 35 of whom are still living as of this writing.

He laments the fact that during the last six months his patients have been refused bronchoscopy, surgery, biopsy, dental care, and other procedures and consultations. In one particular week, six physicians refused even to consult with him on patients simply because of their HIV-1 positive status. He emphasizes physicians' resistance including homophobia, fear of contagion, lack of competence, and our own mortality. He points out, as other have, that this puts us face to face with death and creates a lot of anxiety.

What can we do to make living long and living well an idea whose time has come? We can remember our heritage and training as physicians and scientists, that medicine is an art as well as a science and that the word doctor means teacher. There is no substitute for proper medical diagnosis and treatment, although there may be some debate about what constitutes appropriate therapies. I have seen patients placed on AZT without an HIV-1 antibody test and others with T-4 counts over 700. We must remember that the most common infection occuring in people who are HIV-1 positive is the common cold, and in the northeast, sinusitis, not PCP.

Among the tragedies of this epidemic are people misdiagnosed as AIDS because they respond to IV trimethoprim-sulfamethoxazole, without proper diagnosis of PCP by induced sputum or bronchoscopy. Also, a benign, self-limiting interstitial pulmonary disease has been described.[35] Other patients after a "million dollar" fever workup for exotic diseases, turned out to have bacterial sinusitis and responded to penicillin or erythromycin. Unfortunately, the delay in diagnosis and treatment has caused some patients to progress to abscess formation, bronchitis, pneumonia, and other serious complications. The untreated simple bacterial infection may further suppress and weaken the immune system leading to acute PCP. I have seen this sequence a number of times.

Whether you believe that fear is a major cause of death in AIDS because of the immune suppression it induces, at least consider it as a possibility, and consider your words. The doctor speaks with an authority akin to that of God. Know that your words alone can condemn people to unhappiness, sickness, and death or give them hope, confidence, and self-esteem.

HIV-1 infected patients are extremely frightened and have very low self-esteem; whatever we can do to elevate their self-esteem and diminish their fears will be healing and therapeutic. Healing means is to make whole, not just cure disease. In the words of William Osler, "The job of the physician is to cure rarely, to treat seldom, to comfort always." All people are entitled to no less than the very best care we have to offer.

We could consider doing different things in our offices, such as moving from behind our desks so there is nothing between us and the patient. (This helps communication with all patients). Perhaps we should let patients call us by our first name. Perhaps we should share our own mortality with our patients. It might make us more human to them and reverse some of the criticism of our profession. Perhaps we should even do the unthinkable and hug our patients and let them hug us or at least put our arm around their shoulders as we greet them. I suggest developing a series of optimistic handouts for patients with HIV-1 infection, cancer, and other life-threatening illness.

Many patients harbor years or even decades of guilt. Some in their unconscious accept that they deserve sickness and death. Help them either personally or through referral to explore their anger, grief, fear, guilt, etc. One patient who is a long-term survivor said that he survived because he decided to leave his grief behind.

Stimulate people to go on whatever spiritual journey they are able. For most of us the fundamental questions of life are, *"Who am I?"* and *"Why am I here?"* All long-term survivors have used AIDS as an opportunity to embark on a spiritual journey. They also have taken charge of their life, health, and well-being. Be patient with them.

Educate yourself as much as possible and participate

in the education of your community. There is no reason to have an epidemic of fear. As a community of physicians, research scientists, and health care providers we are in the best possible position to combat it.

Examine complementary or alternative therapies with an open mind. Many patients improve and obtain relief of suffering with visualization, mediation, imagery, acupuncture, nutritional therapies, etc.

Above all, be optimistic. Educate the patient that instead of either beating the virus or the disease now versus dying now, they have many years of living well to anticipate. There are new and optimistic articles all the time.[36] One of the most important just debunked the myth that almost all HIV-1 infected patients get dementia and that asymptomatic, healthy patients frequently had impaired mental functions. McArthur *et al.* have discovered only one man out of 270 asymptomatic, HIV-1 positive healthy people with mild HIV-l dementia.[37]

If you believe long-term survival is possible, you can counsel HIV patients about lifestyle as you do all your patients. I think proper nutrition and maintaining weight are critical to treatment. You can avoid the cruelty of compulsively waking patients in the middle of the night (who desperately need their sleep) to take a dose of AZT because some study did it that way. Most patients never did anyway but suffered needless guilt over it. Let your common sense prevail.

You can be optimistic about the positive affect of drugs. People can take AZT without toxicity; many long-term survivors do.

Of all the things that I teach people, they are most grateful for something that occurs in the first visit. I ask them to have it be okay with them to be here and alive; to be okay how ever they are (physically, mentally, emotionally, and spiritually, including being gay or an IV drug user), and then have it be okay to have the virus. That level of acceptance ends a great deal of conflict and the fear generated by it, which helps enormously in inner healing and eliminating that aspect of immune suppression.

A good analogy is to tell every person with HIV-1 infection that AIDS is a fifteen-round bout, and they have to make a commitment to go the distance. If they give up and die in the first round, which is the first episode of PCP or AIDS defining diagnosis, they will have missed a great deal. I think many people make up their mind to live or die before they ever get the first episode of PCP. There is a fatalistic "let's-get-it-over-with" syndrome in many patients who anticipate ultimate death from HIV-1. We must recognize this and trust it appropriately. Another analogy is a tightrope across Niagara Falls. As long as they remember the rope, they can get to the other side and enjoy the scenery in the process. If they forget the rope the consequences can be illness or death. They need to stay in focus and concentrate on healing themselves first.

Most of all we can show our patients and society that we are unafraid and respond as we have responded in previous epidemics for thousands of years. We were not afraid of epidemics such as tuberculosis, diphtheria, and polio, all of which were far more contagious and transmissible than HIV-1. Why should we be afraid of this virus?

AIDS and your life

An invaluable program for health professionals responsible for one-on-one or community AIDS education activities.

AIDS and your life addresses the concerns of men and women, of teens and adults, of heterosexuals, gays, and bisexuals, of drug users, of whites, blacks and Hispanics.

Based on an award-winning video for physicians, **AIDS and your life** features national experts in the battle against AIDS and deals with such important topics as:

- **AIDS prevention**
- **who needs to know about AIDS**
- **the AIDS virus**
- **the HIV antibody test and who should take it**
- **the impact of AIDS on unborn children**
- **recognizing the risks.**

Another Look at the Data

John G. Bartlett MD

Attitudes of the physician and the patient do have an important bearing on the patient's quality of life with any disease process. However, we do not want to deny the use of various therapeutic agents that, on the basis of well-controlled clinical trials, have demonstrated benefit.

Dr. Pachuta is to be commended for providing a provocative commentary regarding HIV infection. In essence, he has challenged commonly accepted dogma with insightful views. This type of exchange is viewed as healthy, especially for a disease that has been known for only eight years and where we have so much to learn. There are, however, components of the discussion of physicians' attitudes that require comment.

The first point made is that everyone exposed to HIV does not become infected. This is true of virtually all infectious diseases, and it certainly applies to HIV as well. The efficiency of transmission with needle-stick injury appears to be approximately 0.4 percent, with transfusion of contaminated blood about 90 percent, and for perinatal transmission it is 25 to 33 percent. These figures are well verified. For sexual exposure, there are no good data for obvious reasons, but we do know that the frequency of seropositive tests in the wives of men with hemophilia is usually reported at a surprisingly low rate of 10 to 20 percent. Thus, it is easy to endorse the first point. All who have studied this disease agree that HIV is inefficient in transmissibility.

The second point raised concerns the destiny of those who have become infected with HIV. This is more controversial. The optimistic impression that progression is not inevitable is supported only by anecdotal cases. Three very large natural history studies dealing with HIV infection in gay men and transfusion recipients all show that the average time from the point of infection to an AIDS-defining diagnosis is 8 to 12 years.[1-3] HIV infection can be traced in the United States to 1978, so that approximately half those who were infected in the very early stages of the epidemic are likely to lack an AIDS-defining diagnosis. Thus, we would expect there to be thousands of patients who are living long and healthy lives despite HIV infection. But what is unknown is the ultimate destiny of these individuals. Immunologic studies show progressive declines in the CD-4 cell counts indicating immunosuppression, a depressing finding because it means that many or most will eventually develop progressive, symptomatic disease. This is obviously unsettling for the physician, but it is probably important to know for purposes of counseling patients and of planning management strategies.

A further question posed concerns the factors that influence this progression. The natural history studies cited above indicate that approximately 2 percent of patients develop an AIDS-defining diagnosis within two years following seroconversion, whereas others remain apparently well except for laboratory evidence of immunosuppression as long as ten years. This variation in biologic expression of infectious diseases is something we are accustomed to. Some feel that this is strongly influenced by our attitude toward the disease and the message that we give to patients. Others have implicated various co-factors that admittedly have been elusive to define. David Baltimore, in a recent editorial, concluded that the most important factor was virus-specific cytotoxic T lymphocytes.[4] In all probability, the factors that dictate disease progression are multifactorial.

Another concern relates to the CD-4 cell count as an indicator of immunosuppression. This is the major target cell for HIV infection, so there is a certain logic in the association between CD-4 cell count, level of viremia, and the degree of immunosuppression as expressed with opportunistic infection. Studies supporting this association are sufficiently compelling that the National Institutes of Health and the Federal Drug Administration now utilize the CD-4 cell count as the best surrogate marker of immunosuppression for patients with HIV infection. This does not necessarily mean that a patient with a count below 200/mm^3 is destined for *Pneumocystis carinii* pneumonia in the near future; it does imply a 33 percent probability of this infection within the next 18 months.[5]

There is also comment regarding the early use of AZT in patients with HIV infection on the basis of the recent studies conducted by the 35 centers participating in the AIDS Clinical Trials Group,[6] "as though we had found a cure." It should be noted that we are not aware of anyone who is talking about a cure in this disease, although there is considerable enthusiasm about early intervention not only with AZT but also with other measures such as PCP prophylaxis. These decisions are criticized as "major determinants of public policy, treating patients, planning enormous expenditures of funds based on very tiny numbers." It should be noted that the NIH trial cited included approximately 4,000 participants, the largest clinical trial ever conducted in patients with this infection. The original study that led to FDA approval of AZT included just 282 patients, but the long-term follow-up of the FDA decision to approve that drug in March 1987 has shown impressive benefit not only in terms of prolonged survival but also for reduced frequency of opportunistic infections, reduction in weight loss, improved performance status, delays in the reduction of CD-4 cell count, reduction in p24 antigen levels, and virtually every other parameter measured.[7]

Recent studies [4,8] provide additional support for early use of AZT. A previous concept was that the prolonged period of asymptomatic infection correlated with viral latency, with eventual symptoms representing viral activation. The recent work shows there is no latency but that the virus is replicating throughout the period of infection despite lack of symptoms. In fact, the opinion was expressed that, although the CD-4 cell counts correlate with disease progression, by the time these levels are reduced the damage to the immune system is probably irreversible.[7] The implication is that we should be treating even earlier in the course of this infection at a time when the viral load is low so that resistance is unlikely and the immune system is intact. It is obviously premature to make this recommendation at present, although this is the subject of an ongoing study (conducted by the previously noted consortium of centers) that will ultimately provide the answer as it applies to AZT.

No one will challenge the notion that the attitudes of the physician and the patient have an important bearing on the quality of life of patients with any disease process. At the same time, we do not want to deny the use of various therapeutic agents that have demonstrable benefit on the basis of well-controlled clinical trials. Chemotherapeutic agents along with vaccines account for most of the accomplishments of this century in conquering infectious diseases, and it now appears that HIV has become a treatable disease. The difference, compared to many other infections, is that we have no cure. Most importantly, it is easy to endorse the central theme of this issue, "living long and living well" for patients with HIV infection. Despite the lack of a "magic bullet," meaning no cure is in sight, it does appear that HIV infection is becoming a manageable disease in which we probably can make substantial gains on an already impressive track record of medical management. This prediction is based on the assumption that we will be using more and more therapeutic agents in the early stages of disease in an attempt to retain immunocompetence, inhibit viral replication, and insure a long and healthy life.

Response to Dr. Bartlett's Commentary

Donald M. Pachuta MD

I believe there is more involved in progression to AIDS than the virus alone and we can alter outcome by altering these cofactors: habits, emotions, attitudes, and behavior.

The preceding Commentary illustrates well the need for physicians and caregivers to read the literature themselves since the same data have different possible interpretations. A good example of this is the 90 percent (actually 95 percent) transmission of HIV-1 via transfusion. This figure is based on only 38 patients in the study of Ward *et al.* Seronegative recipients were excluded from the data.

While Dr. Bartlett and I agree about 90 percent of the time, there are two areas of difference of opinion.

I believe that not everyone infected with HIV-1 progresses to AIDS. This is supported by the three large natural history studies and the opinion of the co-discoverers of the virus among others. The studies show that a minority of gay men (48 percent) have progressed to AIDS after 10 years. The point is that these men, infected between 1978 and 1981, did not realize their condition (AIDS was not reported until 1981) and did not alter their habits for 3 to 5 years. Still, a minority of this group has AIDS after 10 years. Further, as Dr. Gallo says, most statements about the fate of HIV-1 individuals are based on computer projections, not data.

I believe (and Drs. Montignier and Gallo agree) there is more involved in progression to AIDS than the virus alone and we can alter outcome by altering these cofactors. None of the studies (except Chaisson *et al.*, who show cocaine use as a risk factor) have evaluated the role of behavior, attitude, nutrition, drug and alcohol use, smoking, etc. as factors in infection and in progression to AIDS. We know that at least some of these behaviors are immunosuppressive.

The recent editorial by Dr. Baltimore does not ask the key question: What factors or cofactors influence the virus specific cytotoxic T lymphocyte (and the CD-4 count, development of PCP, etc.) Despite the Baltimore editorial and the study of Ho there are opposite opinions about viral latency.

I fully support the enthusiasm about early intervention with PCP prophylaxis and prescribe it for my patients. Aerosolized pentamidine is relatively nontoxic. Despite our joy, we must know that we are doing this, in the words of Dr. Mazur, "despite the paucity of carefully analyzed and published data about its long-term efficacy and toxicity."

There are many long-term survivors of the disease AIDS. I have spoken of the difficulty they have in being studied. We must realize that anecdotes in large numbers can be valuable. We need only see one white crow to conclude that not all crows are black.

The controversy surrounding use of AZT in patients with CD-4 counts between 200 and 500/mm^3 has been referred to in the articles by Dr. Bartlett and me. The original AZT study had an endpoint of death, and the results were clear. The endpoint of development of AIDS or advanced ARC in the new studies is much less clear. In fact, the biggest criticism of adopting the results is that they have not yet been published in the medical literature months after they were announced. If the endpoint was development of PCP, could we prevent that with prophylactic pentamidine and save AZT for later use?

AZT is a very important drug; we need to define its proper use. This is no controversy about data supporting treatment of patients with CD-4 counts under 200/mm^3. The role of AZT in patients with higher counts (especially 350-500/mm^3) has not been defined by the current studies (despite 4,000 participants, the conclusions are based on progression to AIDS in less than 100 patients in each group).

I know of physicians who called patients or sent letters to those with CD-4 counts between 350-500 mm^3 acting as though they had a cure. I do not believe we should treat perfectly well people with CD-4 counts in the 400s with a potentially toxic drug. I have seen adverse outcomes from this practice.

Finally, I applaud Dr. Bartlett's many contributions and tireless energy devoted to the fight on AIDS. I agree with his conclusions about HIV-1 infection as a manageable disease. However, we must look beyond chemotherapy and vaccines to lifestyle, emotions, attitude, behavior, and other factors to truly live long and live well. We should get every patient to ask what he or she can do mentally, physically, emotionally, and spiritually to live long and live well for the next 5, 10, or 50 years.

We must examine the fundamental questions of how we view illness. Is disease purely physical, involving only external causative factors such as bacteria, viruses, or cancer carcinogens, and therefore healing occurs only through external means such as drugs, chemotherapy, radiation, etc? Or are there internal causative factors of disease? Do the mind, emotions, and spirit modify the onset and progression of illness? Is the patient the healer with the assistance of external means?

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

MRI UPDATE

Figure 1

Figure 2

Figure 3

CLINICAL INFORMATION: This is a 69-year-old male who is unable to abduct his right arm and who has difficulty extending his arm. This is associated with right shoulder pain.

FINDINGS: Figure 1 is a proton density image in the coronal plane of the right shoulder. There is degenerative hypertrophy of the right acromioclavicular joint with a prominent inferior projecting osteophyte (A). A roughly linear area of low signal intensity inferior to the right distal clavicle represents the medial aspect of the rotator cuff (labeled B). A thin linear structure of low signal intensity superior to the right humeral head (labeled C) represents the lateral portion of the rotator cuff. Figure 2 is a T2-weighted image again demonstrating the inferior projecting osteophyte from the acromioclavicular joint (A) and the components of the torn rotator cuff (labeled B and C) as previously described. Increased signal intensity material between the torn portions of the rotator cuff represents joint fluid lying both within the joint space and in the subacromial bursa. Image #3 is a partial flip angle image which is sensitive for T2-weighting. This exhibits increased signal intensity in the immediate region of the rotator cuff tear as well as extending lateral over the right humeral head. The level of this slice is slightly anterior to figures 1 and 2 and the increased signal intensity material represents joint fluid extending over the right humeral head into the subdeltoid bursa.

The MR images demonstrate complete disruption of the rotator cuff which may be due to an acute injury or possibly due to chronic entrapment of the rotator cuff by the degenerated right acromioclavicular joint.

COMMENT: MR imaging is the only modality capable of directly visualizing and differentiating the various soft tissue components of the musculoskeletal system. Only CT arthrography approaches this degree of accuracy in the detection of rotator cuff tears, however CT arthrography like its cousin, routine shoulder arthrography, is invasive and requires injection of contrast into the shoulder joint. MR is the imaging modality of choice in the initial evaluation of soft tissue injuries of the shoulder joint with routine or CT arthrography reserved for those patients on whom the MR study was indeterminate.

Maryland Magnetic Imaging
900 Toll House Avenue / Frederick, MD 21701

NOW LEASING

Council - September 14, 1989
Sheraton Ocean City Resort and Convention Center

The 379th meeting of the Council was held as shown.

Minutes The Council minutes of June 29, 1989 were approved as submitted. In addition, the Council accepted the minutes of the Executive Committee of June 15, July 20, August 16, and August 24, 1989.

Legal Services Dr. Nagel announced that Gerry Evans had terminated his employment with Med-Chi to assume the private practice of law with the firm of Rifkin, Evans, Silver, and Lamone and that a contract had been offered by the firm to provide legal services to Med Chi. Dr. Nagel informed the Council that the Executive Committee had appointed an ad hoc committee to study the contract, and it was the consensus of the committee that it would be financially advantageous for Med Chi to accept the contract.

After discussion, Council adopted a motion to agree to enter into a contract with the law firm of Rifkin, Evans, Silver, and Lamone, if the contract was amended to include an escape clause, and if the amount of the fee to be paid to the law firm was entered into the contract.

Mr. Rifkin and Mr. Evans agreed to amend the contract as directed by the Council. The Council voted to approve the contract as amended.

Committee Reports

Committee on Scientific Activity

CME Cosponsorship Policy Dr. Jack Zimmerman, Chairman of the Committee on Scientific Activity, on behalf of the committee, presented a revised policy for Med-Chi cosponsorship of CME programs, which was approved unanimously by the Council.

Annual Meetings Dr. Zimmerman announced that the 1990 Annual Meeting will be held at the Turf Valley Inn and Country Club on May 9 through 11, and that Med Chi is planning to finalize a contract for five years with Turf Valley. He also explained that due to the size of our group, Med Chi does not use many hotel rooms, which is a requirement of the hotel industry, thus the difficulty we have in finding suitable sites to hold meetings in Maryland. Dr. Zimmerman's report was accepted by the Council as information.

Committee on Alcoholism and Chemical Dependency Dr. Franklin Evans, Chairman, presented a resolution, "The Responsibility for One's Behavior While Under the Influence of Alcohol," for Council's approval. Following the adoption of a motion to amend the resolution by adding the words "and mind-altering drug" wherever the word "alcohol" is mentioned, the resolution was adopted, as amended, as follows:

Resolution - The Responsibility for One's Behavior While Under the Influence of Alcohol and Mind-Altering Drugs

Whereas, The presence of drug dependency or addiction, including alcoholism, may be a significant factor in a person's antisocial and/or illegal actions and may, but not necessarily, mitigate social, administrative or legal sanctions;
Whereas, The presence of dependency/addiction does not, by itself, exempt the person from responsibility for his/her actions; and
Whereas, The twelve step programs (AA, NA, etc.) encourage persons to make amends for past antisocial and/or illegal behavior;
Whereas, The choice is not between treatment or punishment for a drug dependent/addicted person's antisocial and/or illegal behavior; rather these are separate issues; and
Whereas, Each issue needs to be addressed, unless a person was mentally incompetent by legal standards when the action was committed and/or the sanctions would negatively affect his/her recovery from dependency/addiction; therefore be it further
RESOLVED, That the Medical and Chirurgical Faculty of Maryland supports serious consideration be given to requiring both treatment and legal sanctions in adjudication of alcohol and mind-altering drug-related offenses such as DWI, as said legal sanctions may actually motivate a person to pursue a program of recovery.

Employee Health Insurance Ad Hoc Committee Following the report of the Chairman, Dr. Hiroshi Nakazawa, a motion was adopted unanimously to accept the report in which the following recommendations are presented:

1. That Med Chi continue to study the issue of health care for the uninsured by providing the Public Health Committee all acquired information concerning this subject to permit continuation of study and development of a Med Chi position paper;
2. That Med Chi provide assistance, where possible, to all private and governmental groups in attaining appropriate health care services for the uninsured in need of care;
3. That the Med Chi Agency (not the Faculty) be encouraged to participate in consultation services-for-pay related to employer health insurance plans; and
4. That this ad hoc committee be disbanded as having accomplished its purpose.

AMA Delegation Dr. Albert Antlitz, Chairman, presented three resolutions for the Council's consideration. Council adopted unanimously the resolution on the "Use of Insecticides" and the resolution on "Gun Control," however, voted to postpone the resolution submitted by Dr. Henry Wagner on "Support for Improvement of the Health Environment in Developing Countries," until the next Council meeting, October 19, 1989, to which Dr. Henry Wagner, will be invited to present the issue.

The resolutions adopted by the Council are as follows:

Resolution on Use of Insecticides - ADOPTED

Whereas, There are many insecticides, fungicides and other

chemicals used to improve or alter the growth of fruits and vegetables while the safety of these chemicals for human consumption is unproven for the most part; and
Whereas, One of the most important duties of physicians is to help provide as safe an environment as possible for the citizens of this nation; therefore, be it
RESOLVED, That the American Medical Association, at once and with the greatest vigor, bring before the members of the Congress of the United States, our urgent request to curb the inappropriate and unsafe use of these chemicals; and be it further
RESOLVED, That the safety of these and any other chemicals that may be used in the future shall be proven before they may be introduced into the food chain.

Resolution on Gun Control - ADOPTED

Whereas, Over ten thousand lives are lost and countless others seriously injured by firearms in the United States each year;
Whereas, Epidemiologic studies have related firearms kept in the home to many more criminal homicides, accidental deaths, and suicides than to self-protection homicides;
Whereas, Other studies have demonstrated an association between stricter handgun regulation and reduction in handgun crime, assaults, and homicides;
Whereas, The State of Maryland requires a seven-day waiting period from the time of application to purchase or transfer of a handgun before the handgun is finally sold or transferred; and
Whereas, The Supreme Court of the United States has repeatedly ruled that firearms control laws enacted by the states are constitutional; therefore, be it
RESOLVED, That the American Medical Association use its great influence in matters of health to effect passage of legislation in the Congress of the United States;

1. Mandating a national waiting period that allows for a police background check and fingerprint check for anyone who wants to purchase a handgun from a gun dealer anywhere in our country; and
2. Ban Saturday night specials throughout the nation, just as lawmakers have done in Maryland.

Legislative Committee In the absence of Dr. Susan Guarnieri, Chairman, Mr. Gerry Evans presented a brief update on legislative activities. In response to a question by the Chair if Dr. Guarnieri would be requesting more "white papers," Mr. Evans responded in the affirmative and the Chair directed that staff assist as much as possible toward this goal.

Policy and Planning Committee The Council accepted the report of the Policy and Planning Committee and the recommendations contained therein with minor modifications.

Finance Committee Dr. Jose Yosuico, Chairman of the Finance Committee, presented a verbal report of the Faculty's financial position, which included a request for approval of the transfer of funds in the amount of $175,000 from reserves to the operating budget to cover items expended but not previously budgeted and items underbudgeted, and the approval of an increase of $51,000 in the 1989 budget to cover fees for legal services. The Council adopted a motion to approve the requests of the Finance Committee as presented.

Professional Ethics Committee Dr. Louis Breschi, Chairman, presented the committee's recommendations on the following revised statements which were acted upon by Council as indicated:

Release of Information - ADOPTED

103. RELEASE OF INFORMATION (caps indicated changed) Except as provided by law or as authorized by the patient, a physician should not release medical information about a patient to any person. TELEPHONE INFORMATION REQUESTED BY THIRD PARTY CARRIERS OR SIMILAR THIRD PARTIES SHOULD BE REFUSED UNLESS AUTHORIZATION OF PATIENT IS PROVIDED.

Pronouncement of Death - ADOPTED

102. PRONOUNCEMENT OF DEATH (caps indicate change) UNLESS EXCEPTIONAL CIRCUMSTANCES WARRANT OTHERWISE, a body should be identified, viewed, and death verified by a physician. An exception to this directive may occur, if a physician has seen a patient whose death is reasonably anticipated. In that case, a person who is capable of recognizing cessation of respiration and heart beat may verify death for the physician and so advise him in a reasonable period of time.

Physician/Pharmacist Code of Cooperation - ADOPTED

Following Dr. Breschi's explanation of the revisions to the Code, the Council adopted the revised Code of Cooperation unanimously.

Termination of Physician/Patient Relationship - ADOPTED

(CAPS indicate change)

(A) A physician may choose, for whatever reason, to terminate his relationship with a patient. Should termination become an issue before the patient can be safely discharged, the physician must be certain that adequate medical care is available to the patient before terminating the relationship. Should the physician make a decision to terminate, he should notify the patient in writing as soon as possible.
(B) A PHYSICIAN MAY NOT ETHICALLY TERMINATE PATIENT CARE IF TO DO SO WOULD DEPRIVE THE PATIENT OF NEEDED CARE. HOWEVER, A HOSPITAL BY ITS BYLAWS MAY MAKE THE RESPONSIBILITY FOR PATIENT CARE MORE DEMANDING, (FOR EXAMPLE, AN ON CALL PHYSICIAN MAY BE REQUIRED TO PROVIDE INITIAL FOLLOW UP CARE TO THE E.R. PATIENT), BUT THE PHYSICIAN'S RESPONSIBILITY CANNOT BE ABROGATED BY THE HOSPITAL BYLAWS.

Computers in Medicine Committee Dr. Rafael Haciski, Chairman, presented the committee's report in which a request for approval of the installation of an 800 line for incoming instate calls to Maryland MedSig, the Faculty's computer bulletin board. Following Dr. Haciski's presentation of the breakdown of costs for this project totaling approximately $7,200 annually, the Council voted to postpone the matter until the next meeting of the Council, October 19, 1989.

The second part of the committee's report contained a request for an expenditure of $2,000 to be used to convert membership information now maintained on the Faculty's Digital Computer to a computer language and format compatible with the rest of the Faculty's computers. This will enable Med Chi to offer component medical societies a more detailed computerized referral system for their members, improve the capacity to identify and locate physicians who are not members of the Faculty, and provide instant access to important statistical information on Faculty members.

A motion was adopted unanimously to approve the expenditure of a one-time charge of $2,000 to convert the data as stated in the report.

Agenda Items

On the call of Chairman Dr. Nagel, agenda items III-K, IV, V, and VI were approved by the Council under the "consent calendar":

Item III-K. Specialty Society Committee The committee's recommendations were approved as follows:

(a) That Dr. Kenneth Lewis serve as the committee's representative to the Council;
(b) That the committee continue to work toward identifying seven members as representatives to the House of Delegates; and
(c) That the committee continue to work on the development of further criteria for specialty society membership on the committee in accordance with the motion of the House of Delegates, April 1989.

Item IV. Emeritus Members The following physicians were approved for emeritus membership in the Faculty at the request of the component society indicated:

Baltimore City
Vantana Sadarananda MD, Baltimore

Prince George's County
Philip A. Cox MD, Fredericksburg, VA
Julio C. Quintana MD, Lanham

Item V. Dues Waiver The following physician was approved for 1989 dues waiver at the request of the component society indicated:

Baltimore City
Jonas H. Cohen MD, Baltimore

Item VI. New Business

A. Hospice Care - (information item) Council was provided with a copy of letter from the Medical Care Policy Administration of the Department of Health and Mental Hygiene regarding a policy to become effective October 1, 1989 which will cover hospice care as an option under the Medical Assistance Program. This information has also been provided to the component societies and to the Faculty's Liaison Committee with the DHMH.

B. Medicare (BC/BS) - (information item) A copy of letter from Blue Cross/Blue Shield of Maryland addressing the medical policy of Medicare on Epidural Opiate Analgesia, Patient Controlled Analgesia (PCA), Laser Angioplasty, Atherectomy, Spect Imaging, and 5 FU/Leucovorin for Treatment of Solid Tumors was provided to the Council for information. This information has also been sent to the component medical societies and to the Faculty's Committee on Managed Care.

C. Council November Meeting Date Due to a conflict with the AMA Interim Meeting, the Council approved a change in the November meeting date from November 30, 1989, to Thursday, November 16, 1989.

Old Business

White Papers

AIDS - Dr. Donald Pachuta, Chairman, Committee on AIDS, presented his "white paper" which, after the adoption of an amendment to Item VII to change the last sentence to read "We recommend a Faculty policy in opposition to any such requirement for CME on the subject of AIDS or HIV infection," the paper was adopted by the Council as Med Chi's official position on the subject of AIDS.

Drug Control - A "white paper" presented by Dr. Nelson Goodman, Chairman, Committee on Drugs, on the issues of prescription drug control and dispensing, was adopted by the Council.

Problems of the Uninsured

Cholesterol Testing - Dr. Herman Maganzini, Chairman, Public Health Committee, presented an oral report on the problems of the uninsured and on cholesterol testing, and stated that he is in the process of preparing "white papers" on both subjects.

Other Business

Dr. Nagel announced that a meeting of the Council would be held on Thursday, October 19, 1989, to address financial matters and peer review issues among other things.

Peer Review Dr. Gary Rosenberg, on behalf of the Baltimore City Medical Society, presented the following motion, which was tabled until the October 19, 1989, meeting of the Council:

That Med Chi explore the availability of funding to be allocated equitably through Med Chi to the component medical societies to finance peer review; and
That Med-Chi include in its 1990 budget a line item to pay each component society $300 or more for each case reviewed by the component society, provided that the Peer Review Management Committee approves the review and report for submission to the Board of Physician Quality Assurance. In any case in which the Peer Review Management Committee finds the report inadequate and requires a re-review by another review committee, no amount will be paid to the component performing the original review.

Executive Committee - September 28, 1989

Minutes - It was reported that there were no minutes to be approved, having been approved at the last meeting of the Executive Committee on August 24.

Committee Reports

Public Relations Committee The Executive Committee was advised that the committee recommendations contained in the report had been accomplished. Regarding public relations, Dr. Bob raised the issue of the Giant Pharmacy's advertisement on TV and radio advising potential customers of their drug profile system. The Chair accepted Dr. Dobridge's volunteering to pursue this issue through personal contacts within the Giant Pharmacy system. The Public Relations Committee also requested that Faculty President Dr. Atkins, attend their next meeting on October 18.

Peer Review Management Committee It was reported that there was agreement between the Peer Review Management Committee Chairman, Dr. Christopher Harvey, and the Board of Physician Quality Assurance's Subcommittee Chairman, Dr. Peter Dans, on all aspects of the Peer Review Manual. The manual is in the process of being prepared in final form by Med Chi and will be presented to the Council by Dr. Harvey and Dr. Dans at the October 19, 1989 meeting. Dr. Nagel stated that due to the excessive costs involved, copies of the manual would be provided to the full-time executives of component medical societies, who would be responsible for notifying their councilors that the Peer Review Manual would be available in their respective offices for review prior to the Council meeting on October 19.

The Executive Committee discussed, at length, the following motion, which was tabled by the Council at its meeting on September 14:

> That Med-Chi explore the availability of funding to be allocated equitably through Med-Chi to the component medical societies to finance peer review; and
> That Med-Chi include in its 1990 budget a line item to pay each component society $300 or more for each case reviewed by the component society, provided that the Peer Review Management Committee approves the review and report for submission to the Board of Physician Quality Assurance. In any case in which the Peer Review Management Committee finds the report inadequate and a re-review by another review committee, no amount will be paid to the component performing the original review.

During the discussion, the Chair directed staff to prepare a proposal to address the development of Med Chi's statewide plan in regard to the peer review process; that is, the costs involved, goals, etc. and, further, that staff meet with the executive directors of major component societies and presidents of those component societies without full-time executives, to discuss the plan prior to the October 19 meeting of the Executive Committee, at which time a preliminary report on this issue is to be presented.

White Papers Dr. Atkins stated that he would like to have all white papers completed before the 1990 legislative session. Further discussion of the white papers was deferred to executive session.

Press Releases The Chair directed that all Med Chi press releases be sent to the component societies for information.

Legislative Gerry Evans updated the Executive Committee on the Fineblatt Commission's possible recommendations for both uninsured citizens and for the probability of establishing a cost control system on physicians, similar to the HSCRC's position on fees for hospital inpatients. Dr. Nagel announced that he and the executive director had interviewed a potential candidate for the position of in-house counsel.

Triplicate Prescriptions Mr. Troisi reported that Dr. Nelson Goodman, Chairman of the Committee on Drugs, had met with Mr. Bob Neill of the Governor's Drug Commission, along with representatives from Johns Hopkins and the University of Maryland, and other physicians. There was agreement and acceptance of Med Chi's four-point position: to increase the accessibility of detoxification programs, to increase the accessibility of drug rehabilitation programs, to educate all physicians as to the appropriate interim treatment of those using drugs, and lastly, to increase the awareness of physicians relative to any inappropriate prescription practices being unacceptable and, indeed, of criminal behavior.

■ ■ ■

Executive Committee - October 19, 1989

Legal Council - The Executive Committee welcomed Gregory Hall, Esq. who has joined the law firm of Rifkin, Evans, Silver, and Lamone and will serve as the in-house legal counsel for the Faculty.

Minutes - The Executive Committee minutes of September 28, 1989 were approved as distributed.

Committee Reports

Occupational Health Committee - The Executive Committee accepted the minutes of this committee and approved the recommendations as follows:

> 1. A draft letter to be sent to Worker's Compensation insurance carriers, requesting information on their guidelines for length and cost of treatment for lower back injuries and pain; and
> 2. The committee's request to invite a representative from a private rehabilitation cost containment company to share with the committee on how the database was accumulated in reviewing hospital bills for Worker's Compensation cases.

Public Relations Committee The results of the Expenditure Targets (ETs) campaign to keep Med Chi physicians informed about ETs were presented to the Executive Committee. It was pointed out that the Public Relations Committee had polled members of the Faculty's House of Delegates at its meeting on September 14, 1989, which resulted in 97 percent of the

members who indicated that the committee's efforts had been successful. The committee requested approval of the Executive Committee for funds in the amount of $400 to conduct a second survey of physicians through the *Maryland Medical Journal* to obtain more accurate information on the campaign's impact upon the membership, and also to survey the senior citizen groups. The Executive Committee felt that the results of the House of Delegates poll was an adequate statement that the program was successful and declined the committee's request for funds for this purpose.

Committee on Young Physicians The Executive Committee adopted the following recommendations of the Young Physicians Committee contained in its report of October 2, 1989:

1. That the committee be authorized to solicit funds from pharmaceutical companies to hold a social event at the 1990 Annual Meeting of the Faculty; and
2. That the committee be authorized to plan an educational program for young physicians to be held during the 1990 Annual Meeting.

The Executive Committee suggested that the Young Physicians Committee consult with the Committee on Scientific Activity if any funding is necessary to implement these plans for the 1990 Annual Meeting.

Committee on Alcoholism & Chemical Dependency Report accepted, no action required.

Committee on Public Health Subcommittee of Maternal Health and Welfare - Dr. Raymond Atkins reviewed the recommendations presented to the Executive Committee and spoke highly of the Committee and its intentions. The Executive Committee approved the Subcommittee's request to:

1. Form a joint committee with the DHMH Division of Maternal Health and Family Planning to continue review of all incidents of maternal deaths in the State of Maryland, and
2. Grant the Subcommittee authority to assist the Maryland Health Coalition in the development of a second brochure on Cesarean sections to teach patients about recognizing preterm labor, although no dollar figure accompanied this recommendation. The Executive Committee agreed no funds are to be allocated for this purpose.

Peer Review Management Committee Mr. Troisi reviewed the summary report of the peer review process and its cost implications with the Executive Committee, and presented the following recommendations:

1. That the current peer review process remain in effect at this time;
2. That physician nonmembers of Med Chi be required by legislative action to contribute monies to Med Chi in support of the Peer Review and Physician Rehabilitation Program.

This issue is scheduled for presentation to the Council today, October 19.

PRO Monitoring Committee The Executive Committee discussed, at length, a letter from Dr. John Singer, Chairman, PRO Monitoring Committee, in which it was reported that Delmarva has agreed to participate in HCFA's pilot project involving office-based review. 250 Maryland physicians ("volunteers"), divided into seven specialty areas, will have their office charts reviewed by Delmarva for quality of care, ancillary service utilization and the comparison of bills to Medicare with documentation that the services were indeed provided. If the program is successful, the next step would be a broad-based review of the office practice of medicine for all groups dealing with Medicare patients. In his letter, Dr. Singer indicated that during the pilot project, Delmarva will reimburse physicians for the copying of office charts to be sent to the Delmarva office; however, the physician will more than likely have to absorb the expense of chart duplication.

Also, beginning on January 1, 1990, HCFA has mandated that Medicare will start paying for home IV therapy, and that there will be a specific formulary of drugs that Medicare will use as an accepted list for reimbursement. This will require a huge amount of paperwork, including pre-authorization, before any Medicare patient can be discharged on this type of treatment.

Following discussion of these issues, the Executive Committee directed that a letter be sent to the Delmarva PRO, over Dr. Nagel's signature, expressing Med Chi's concern about the manner in which peer review is conducted by Delmarva.

■ ■ ■

Council - Special Meeting - October 19, 1989

Minutes The Council minutes of September 14, 1989 were approved as submitted, and the Executive Committee minutes of September 28, 1989 were accepted by the Council.

Peer Review Management Committee Dr. Christopher Harvey, Chairman, presented an overview of the committee's work citing its problems and responsibilities from the inception and expressed his appreciation to those who were instrumental in completing the *Peer Review Handbook*. He stated that the committee was satisfied with the final version of the handbook and requested Council's approval. Dr. Peter Dans, Chairman of the Subcommittee of the Board of Physician Quality Assurance, stated that the handbook had become a national model to be used by other states. Following discussion, Council voted unanimously to approve the handbook, which will be forwarded to the Physician Quality Assurance Board for final approval. Council demonstrated its appreciation to those responsible for producing the handbook with a round of applause.

Hospital Medical Staffs Committee

Credentialing Dr. Victor Hrehorovich, Chairman of the Hospital Medical Staffs Committee, provided an

update on the proposed Faculty credentialing service and presented the committee's recommendation that the service be implemented immediately. Dr. Hrehorovich stated that $16,000 would be needed for start-up costs for the Med Chi credentialing program and that these costs would be recovered and returned to the Faculty. On motion by Dr. Lawrence Fink, the Council voted to proceed with the program. During the lengthy discussion, it was pointed out that the hospitals had been solicited by the Maryland Hospital Association for a commitment to participate in the MHA proposed credentialing system.

Committee on AIDS Dr. Donald Pachuta, Chairman, addressed the Council with a request for approval to offer the expertise of the Faculty and the Committee on AIDS to both public and private schools in Maryland, which the Council approved unanimously. Dr. Pachuta also presented a recommendation to revise the current "white paper" on AIDS to include Med Chi's position as opposing mandatory reporting of asymptomatic individuals who are HIV positive. Following discussion, the Council adopted a motion to approve the inclusion of this statement in the AIDS "white paper."

AMA Delegation Dr. Albert M. Antlitz, Delegation Chairman, reported the actions of the Delegation on a resolution entitled, "Support for Improvement of the Health Environment in Developing Countries," which, if approved by Council, will be presented to the AMA House of Delegates at its Interim Meeting in December. Dr. Carl Taylor, Professor Emeritus of International Health at the Johns Hopkins Medical Institutes, in the absence of Dr. Henry Wagner, AMA Alternate Delegate, presented the resolution, which was adopted unanimously by the Council, as follows:

Whereas, The AMA has always manifested sincere concern for health conditions among the poor and neglected people and expressed this concern specifically by promoting action to improve health conditions in developing countries;

Whereas, In many countries in Africa, Latin America, the Caribbean and Asia child mortality has gone up abruptly in the past 5 years;

Whereas, The underlying reason for these sharp increases in mortality were cuts of 30% to 50% in national health budgets in response to economic adjustment policies imposed by the International Monetary Fund to pay interest on massive loans of hundreds of billions of dollars. Most of this indebtedness is to American banks, the IMF and World Bank;

Whereas, These banks have already set aside most of the funds needed to remit these loans if given encouragement and incentive;

Whereas, There are further problems emerging in many African, Caribbean and Latin American countries where local economies are in shambles because of structural adjustment policies so that unemployment is rising sharply, hunger is increasing among the poor and political instability is impending;

Whereas, The health sciences have provided a unique grouping of simple and inexpensive child survival interventions which could sustainably reduce infant and child mortality by an estimated 50% if applied as part of primary health care in most developing countries;

Whereas, The Expanded Program for immunization against six common childhood diseases has in the past 5 years averted an estimated 1 1/2 million of the 14 million preventable child deaths each year in developing countries, with a similar reduction of 1/2 million deaths from the use of oral rehydration for diarrhea. For the average African country to maintain these programs under present financial constraints is manifestly impossible while the massive indebtedness persists; and

Whereas, The potential for a worldwide child survival and development revolution needs to be actively promoted and this can be done only if national governments are given special incentives both to invest in sustainable and self-sufficient health and nutrition service and to improve local environmental and ecological conditions; therefore be it

RESOLVED, That the American Medical Association take all possible action to:

1. Encourage Congress to express a strong and clear commitment to continue the promotion of measures to improve child survival and development through long-term health and environmental programs in the poor countries of the world; and

2. Promote in Congress the passage of legislation that will provide tax and other incentives so that American Banks, the IMF and World Bank will remit national debts in developing countries on the condition that *additional* funds in local currency, *equivalent* to the payments required under current obligations will be allocated to continuing programs for the following activities:

(1) Expansion of child survival and nutrition programs.

(2) Development of primary health care infrastructure.

(3) Initiation and expansion of control efforts against major endemic diseases such as malaria, leprosy, tuberculosis, childhood pneumonia and other infectious diseases.

(4) Improvemnt of environmental conditions to enhance the quality of life and protect local ecology in developing countries where massive environmental deterioration is having both local and worldwide impact.

Emeritus Members The Council approved the following physicians for Emeritus Membership in the Faculty as requested by the component society indicated:

Baltimore County

William P. Houpt MD, Bel Air

Montgomery County

Francis J. Crilley Jr. MD, Bethesda
Marvin I. Mones MD, Silver Spring
Steven Oristian MD, Auburn, NY
Roland H. White MD, Laurel

These names will be presented to the House of Delegates for consideration at its 1990 annual session.

Old Business

White Papers Draft copies of white papers on "Cholesterol Testing" and "Problems of the Uninsured" were distributed to Council for consideration of approval. The Council adopted the proposed position paper on "Cholesterol Testing" with the recommendation that the paper be reviewed on an annual basis due to changing concepts. Dr. Ted Lewers recommended several changes to the white paper on "Problems of the Uninsured," which resulted in a motion, duly seconded and adopted, that Dr. Lewers and Dr. Maganzini

review the proposed changes to the position paper and present their recommendations to the Council at its November 16, 1989 meeting.

Peer Review Funding At the September 14, 1989 meeting of the Council, the following motion by Dr. Gary Rosenberg, presented on behalf of the Baltimore City Medical Society, was postponed by the Council. The motion reads:

> That Med Chi explore the availability of funding to be allocated equitably through Med-Chi to the component medical societies to finance peer review; and
> That Med Chi include in its 1990 budget a line item to pay each component society $300 or more for each case reviewed by the component society, provided that the Peer Review Management Committee approves the review and report for submission to the Board of Physician Quality Assurance. In any case in which the Peer Review Management Committee finds the report inadequate and requires a re-review by another review committee, no amount will be paid to the component performing the original review."

Relative to this matter, the following recommendations of the Finance Committee were also considered by the Council:

> 1. That no funds be transferred from reserves for new projects at this time, and
> 2. That the decision is to be made by the leadership if the Faculty should reimburse components for peer review costs before the Finance Committee completes the budgeting process for 1990.

Further, the Executive Director presented a report to the Council which addressed the peer review process and cost implications and contained the following recommendations:

> (a) that the current peer review process remain in place at this time, and
> (b) that physician nonmembers of Med Chi be required by legislative action to contribute monies to Med Chi in support of the Peer Review and Physician Rehabilitation Programs.

Following discussion of the issue, the Council adopted a motion by Dr. Lawrence Fink to accept the recommendations of the Finance Committee and those of the Executive Director to deny the motion to fund the component societies for processing of peer review cases.

Legal Counsel Gerry Evans introduced Gregory Hall, Esq., who has been employed by the Council, firm of Rifkin, Evans, Silver, and Lamone as Med Chi's in-house legal counsel.

New Business

Medicaid Diversion Dr. Joseph Fastow, in the absence of Dr. Gary Rosenberg, Chairman of the Liaison Committee with Medical Assistance Programs, briefed the Council on the Medicaid Diversion Project and the payment schedule for emergency physicians which limits reimbursement to a single fee of $13, regardless of the level of service rendered. Dr. Fastow further stated that the plan proposes that emergency physicians will be reimbursed at a rate of $9.50 for those patients diverted to less expensive sources of primary care, which is $3.50 below the fee paid to primary care physicians. Following a lengthy discussion, the Council adopted a motion to support a tiered level of payment for services provided by emergency physicians, similar to that of primary care physicians, and further, that there be no discrimination against emergency physicians in this state or any other state relative to payment for services.

Medical Mutual Dr. Raymond Yow, President, and Mr. David Murray, Chief Executive Officer, Medical Mutual Liability Insurance Society, were present to answer questions regarding Medical Mutual's recent announcement that a 20 percent dividend credit in liability insurance rates will be offered to all Med Mutual members who renew their policies in 1990. The Council was informed that the dividend credit and reduction in the Rate Stabilization Reserve Fund are the direct results of the cumulative efforts of tort reform and insurance legislation enacted by the Maryland General Assembly. Appreciation was given to the combined efforts of all Med Chi personnel, physicians, and staff alike, with special thanks to Executive Director of Medicine, Angelo Troisi and Dave Murray, Chief Executive Oficer, Medical Mutual for their coordination of these efforts. The Council gave a round of applause in appreciation of Med Mutual's efforts to reduce the cost of malpractice insurance for the physicians of Maryland.

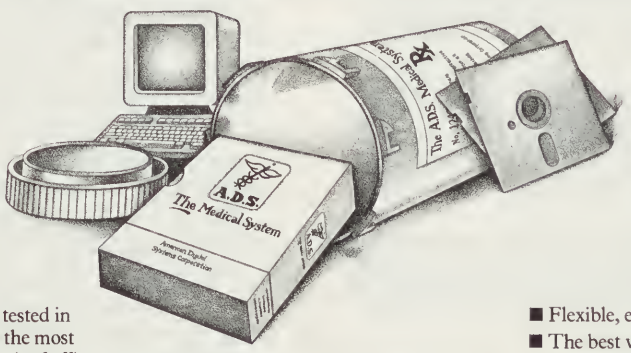
Blue Cross/Blue Shield Council received as information a report by Dr. Barry Gold, Medical Director, Medicare Program of Blue Cross/Blue Shield of Maryland, who informed the Council that Medicare was reviewing a random sample of nonparticipating physicians who perform elective surgical procedures for charges of $500 or more, as required the provisions of the Omnibus Budget Reconciliation Act of 1986. The law dictates that if the nonparticipating physician plans to perform an elective surgical procedure for which he charges at least $500 and he does not intend to accept the Medicare assignment, the patient must be given written disclosure of the physician's estimated actual charge for the surgery, as well as the estimated Medicare approved charge and the difference between the physician's actual charge and the Medicare approved charge. Physicians are required to retain in their files copies of all letters concerning charge information sent to their patients. The carrier will monitor for compliance with law by periodically requesting copies of the letter and, in the event a copy of the letter is not provided the carrier, the physician will be required to refund the patient any payments in excess of the Medicare allowances.

Award to Governor Schaefer It was reported to Council that Governor William Donald Schaefer had been awarded the AMA's Dr. Nathan Davis Award for Outstanding Public Service. The award recognizes contributions by public servants promoting the art and

science of medicine and the betterment of public health.

Executive Director Dr. George Malouf pointed out the relative significance of the accomplishments of Med-Chi's Executive Director, and asked the Council to consider the renewal of Mr. Troisi's contract for an extension of five years. The matter was postponed for discussion in executive session, immediately following the meeting.

Announcement Dr. Lewers announced that Ben Cardin had been appointed to the House Committee on Ways and Means and reminded the Council of the potential beneficial aspects that this appointment may have for Med Chi.



Executive Session During the executive session, Council took up the motion of extending the Executive Director's contract for a five-year term. During the discussion, it was stated that the legal/lobbying services provided by Med Chi's law firm for a five-year contract period must be matched by Med Chi's administrative continuity for a similar five-year period, so as to maintain the teamwork so vital toward continuing the accomplishments experienced in the immediate past. After additional comments, the Council approved, unanimously, the motion to extend Angelo Troisi's contract for a five-year term and directed the Council Chairman to accomplish necessary agreements. ■

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

Mail Ordering Medical Supplies

Doctor, in many of the magazines for diabetic patients such as Diabetes Forecast *and* Diabetes, Self-Management *there are mail order advertisements for glucose meters, test strips, syringes, insulin, and other supplies. Usually the prices quoted are less than those at the neighborhood pharmacy and an 800 number for ordering is often provided. Is it safe to order supplies from places with mail delivery?*

As you know or have heard, mail order businesses are usually reputable, but a few bad ones taint the industry. Reputable magazines screen advertisers as well as they can, yet an occasional bad one may make the advertising pages. If one orders a product by telephone for mail delivery and pays by credit card, payment can be canceled with no financial loss if delivery is not made or the product is not as described.

When purchasing a blood glucose monitoring instrument, the purchase price includes one-on-one instruction until the instrument is mastered. Since this cannot be accomplished by telephone, the purchaser is short-changed with a mail order purchase. I would not recommend purchasing a blood glucose monitor by mail unless it is a device identical to one you have been trained to use.

Insulin should not be ordered for routine mail delivery because the way it is handled those few days in transit may affect its potency and stability. If it is delivered by a "special handling" system, any comment on that delivery would depend on how "special" the handling might be managed. With a medication as essential as insulin it is best to err on the side of safety in its handling.

Ordering glucose tablets, glucose test strips, insulin syringes, and other supplies probably could be done safely by mail. Test strip manufacturers probably would replace any unsatisfactory product of theirs that you might receive through the mail. Be sure to check that the strips received are not "outdated."

Unfortunately, chain drug stores have almost completely replaced independent pharmacies, and one cannot easily become acquainted with the pharmacist. But if you can get to know a pharmacist, you will often find his/her prices competitive and he or she will take a personal interest in your health.

To help remedy any problems you might have with "mail order merchandise" the FTC has published a four-page brochure "Shopping by Phone and Mail" detailing the protection you have under the FTC's mail order merchandise rule. To be advised of your rights, order your free copy from

Metastatic Melanoma from an Unknown Primary Site

Before we discuss metastatic melanoma, we must realize that there are four major types of primary melanomas: cutaneous, mucosal, ocular, and meningeal. The most common is the cutaneous, which can be diagnosed in any area of the skin including the scalp, ears, under the nail (subungual), or eyelid.

Primary mucosal melanomas constitute over two thirds of extracutaneous melanomas. These can be detected in the head and neck region: the nasal cavity, nasopharynx, oral cavity, oropharynx, larynx, hypopharynx, esophagus, and occasionally in the maxillary sinuses. It also can occur in the vulva, vagina, and anal canal.

Primary ocular melanomas constitute almost one third of extracutaneous melanomas and include conjunctival, choroidal (most common), iris, ciliary body, and very rarely in the lacrimal sac.

Primary melanomas of the central nervous system are extremely rare; only 124 cases have been reported. These also are known as leptomeningeal melanomas. While the first three types tend to metastasize regionally as well as systemically, leptomeningeal melanomas do not and are diagnosed at time of surgery or autopsy.

The majority of patients present with an easily detectable primary site such as skin lesion or eye symptoms related to retinal separation (melanoma being the most common malignant tumor of the eye). Occasionally, a patient will present with either lymph node metastases or distant metastases but no detectable primary. Patients with occult primary melanoma constitute 4 to 12 percent of patients with metastatic disease. Almost two thirds of those patients present with metastatic lymph node, most commonly in the axilla. The other third will present with distant metastases in the skin, subcutaneous tissue, lungs, brain, or any other site.

About 10 percent of the patients with metastatic melanomas from an unknown primary may give history of a previous skin mole that had been cauterized or curetted one to three years before. Similarly, the patient may have a nevus that had been scraped off leaving a scar at that site. However, the majority of these patients have no previous history of primary melanoma.

The clinical evaluation of such patients must include careful search of the whole skin surface, and specifically the skin area that drains in that direction, for possible primary site. Special attention should be directed to areas that may be covered by cosmetics (such as the eyelids) and hairy areas (scalp and pubic areas). Suspicious lesion(s) must be biopsied. Areas of skin depigmentation must be looked for because one hypothesis is that the primary lesion may have spontaneously disappeared, having been destroyed by the immune responses of the body. However, some clones of cells with metastatic potential may have escaped such immune surveillance and settled as metastases. Another explanation for metastatic melanoma from unknown primary sites is that it may have arisen from a mucosal or eye tissues. Therefore, it is essential to carry out special examination of the eyes, nasopharynx, oropharynx, oral cavity, larynx, maxillary sinuses, vagina, vulva, and anal canal.

The site of metastases may help in identifying the site of origin and may reflect on the prognosis. The prognosis tends to be better for patients with regional metastases rather than those with distant metastases. Metastases in the axillary lymph nodes, which are the most common, may have better outcomes as they are presumably from a cutaneous origin. Groin metastases originating from a cutaneous origin in the extremity may have a better prognosis than if they had risen from a mucosal origin. Cervical lymph node metastases may have the poorest prognosis as these may represent metastases from mucosal or eye lesions. On the other hand, any of these metastases may represent distant metastases rather than a regional one and may have originated from any of the other sites mentioned. Therefore, the workup must include the search for other metastases as well as for the primary.

The management of such patients should be in the form of a well-planned surgical approach seeking cure or at least palliation. Patients with regional lymph node metastases should undergo radical lymphadenectomy. Their overall five-year survival is about 40 percent, depending largely on the number of the positive lymph nodes. It is almost similar to the survival rates reported in stage II melanoma. Patients with skin and subcutaneous metastases have a better prognosis compared to those with metastases to parenchymatous organs with a two-year survival of less than 30 percent.

BROADCAST PRACTICE: Medical Reporting in the 1990's

AMA's Tenth Annual Health Reporting Conference

Denver, Colorado April 5-8, 1990

If you are a medical communicator wishing to sharpen your skills, plan to attend the AMA's Tenth Annual Health Reporting Conference, Thursday, April 5 through Sunday, April 8, 1990 in Denver, Colorado.

This is a unique conference designed for medical reporters, physician broadcasters and medical spokespeople. The conference features a combination of skills development courses in broadcast writing, interviewing, editing and production, plus opportunities to have your tapes critiqued by experts. Network with the pros and learn valuable tips on breaking into the business and advancing your broadcast practice.

Faculty includes experienced physician broadcasters, network producers, broadcast consultants, writers, editors, producers and professional speakers trainers.

Until February 15

Fees:	AMA Member	$590
	Non-Member	$750
	Students/Residents	$200
	Optional Day	$250
	Individual Coaching Sessions	$ 50

February 16 and beyond*

Fees:	AMA Member	$650
	Non-Member	$825
	Students/Residents	$250
	Optional Day	(not available after cut-off 2/15/90)
	Individual Coaching Sessions	$ 65

Course tracks are offered in Speakers Training (Introductory and Advanced) and Broadcasting (Introductory, Intermediate and Advanced). Electives are open to all participants. Complete registration information is available by calling 312/645-5102.

*Registration will be accepted only on a space available basis after the February 15 cut-off date.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc. Will Speed Up Your Billing And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s "Computer-Side Manner" Is The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

SERVING MARYLAND PHYSICIANS

The Med Chi Agency was established by the Medical and Chirurgical Faculty in 1975, and now has over 5,000 physicians and employees as clients.

The Agency is committed to providing the most cost effective insurance coverage for physicians. You will benefit from the many coverages available for both your professional and personal needs. You will also benefit indirectly, because the Faculty owns the Med Chi Agency and the earnings from its operations.

For complete information about any insurance product or service, just give us a call. We will meet with you at your convenience.

Med Chi congratulates the following Maryland physicians who received this award in September 1989:

Gary Joseph Antone MD
William Radford Coyle MD
Dino Ernesto Flores MD
Nicholas J. Kohlerman MD
Brian N. Meringoff MD
Manouchehr Sadri MD
Geo E. Yannakakis MD
Hector P.C. Asuncion MD
Pedro Santos De Borja MD
Rafi Q. Iqbal MD
Andrew Monroe London MD
Judith F. Morales MD
Virendra K. Saxena MD
Judith M. Chertoff MD
James D. Felsen MD
Don Robert Johnson MD
Wolfgang Mergner MD
Debra Risher-Flowers MD
Stanley M. Silverberg MD

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

CALL COLLECT

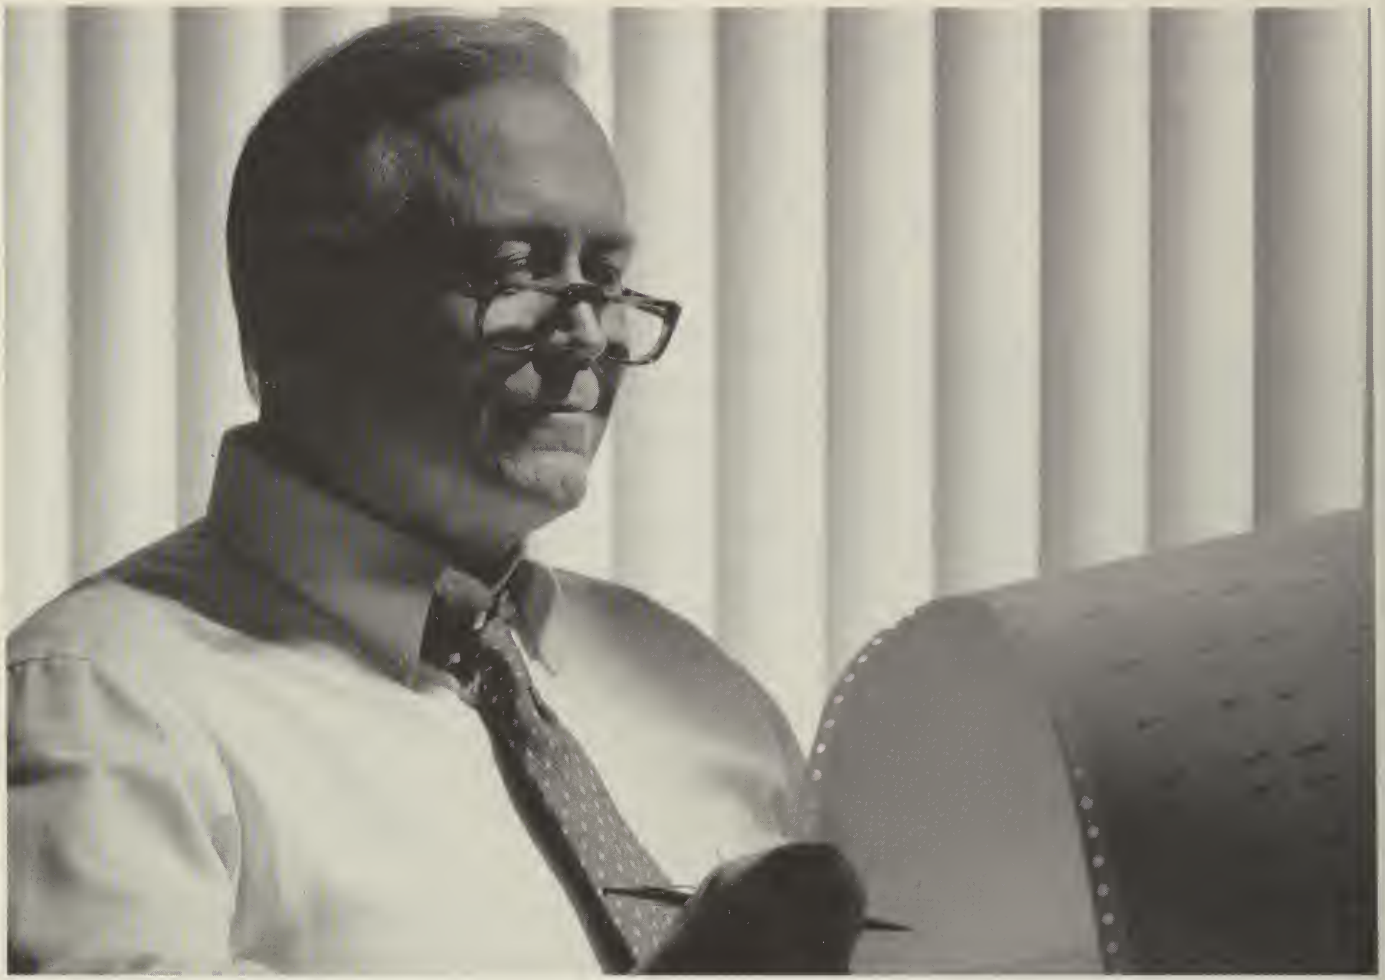
"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.



Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

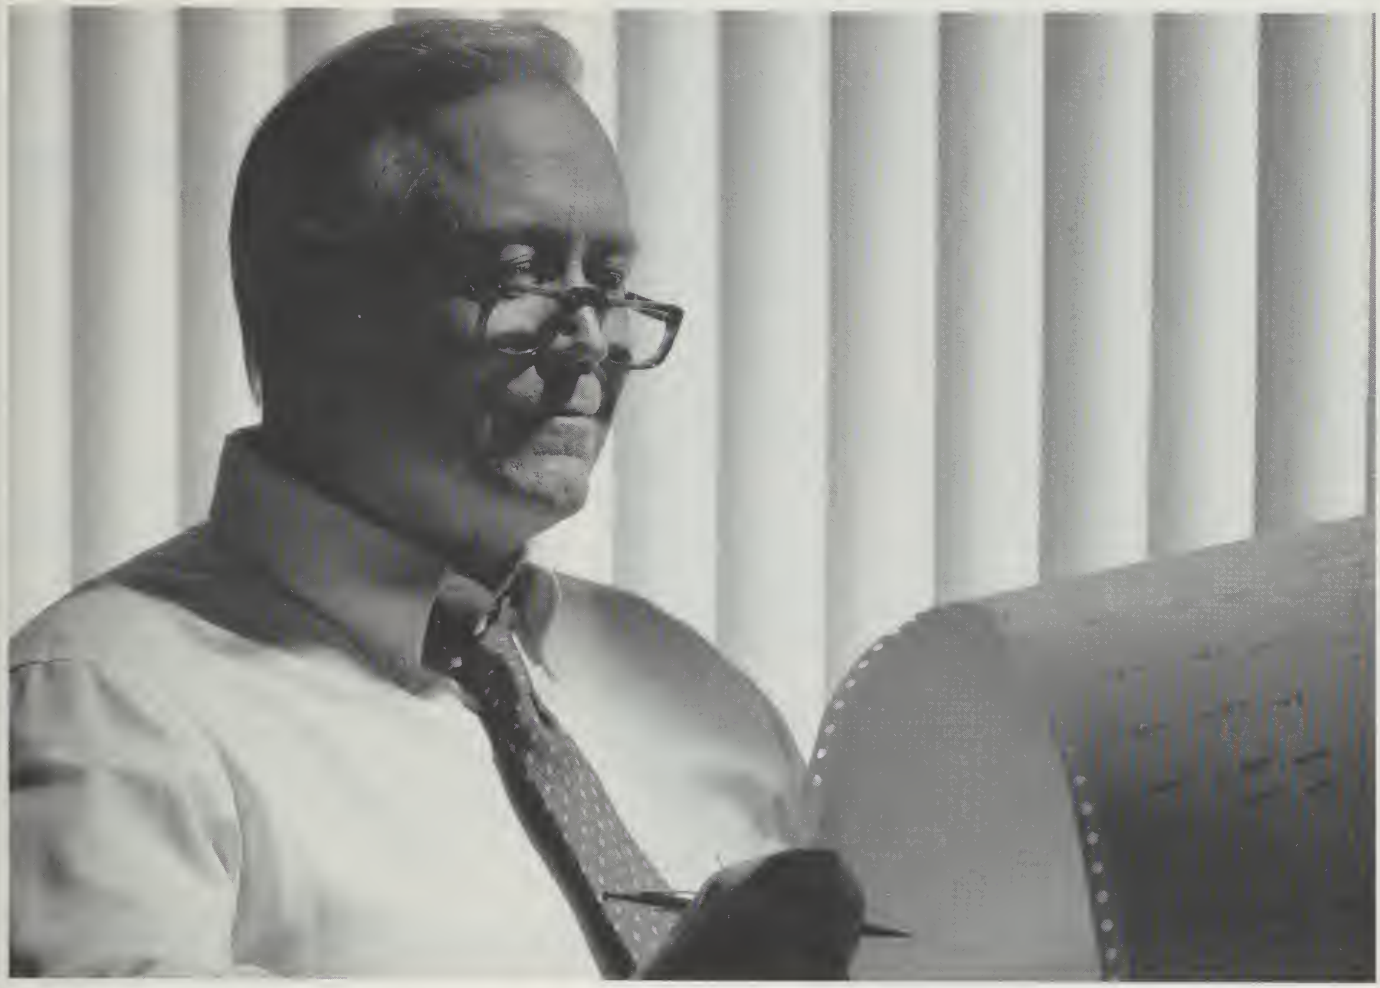
Maryland Physicians: Thanks To You, It Works.

The history of Medical Mutual is really the story of physicians working together to surmount complex problems which had defeated others. Through cooperation, persistence and the strength to make difficult decisions, the physicians of Maryland have set an example for the rest of the country.

It all began, of course, in 1975 when the major medical malpractice insurers announced they were leaving Maryland. Spiraling malpractice awards and the prospect of large-scale losses, the companies said, made it impossible to do business in Maryland. As the potential threat to public health became evident, many people feared that health care delivery in the State was on the verge of collapse.

With no relief in sight, physicians, citizens, and the General Assembly worked together to create what had never before existed anywhere — a medical professional liability insurance company owned and directed by its physician members. On June 3, 1975, Medical Mutual was created.



Over the past 15 years, other companies have come, and gone, and come again — entering Maryland when there were profits to be carried away, and leaving whenever times got tough. Through it all, Medical Mutual's physicians have proved that their long-term commitment was the right choice.

For 15 years, our thousands of physician members have been at the heart of what we are, and we are unique because of your needs, your insight, and your guidance.

The success we have earned was by no means universally predicted in 1975. But we survived those difficult first years, and now, 15 years later, we are proof of what physicians can do when they work together for a common goal.

Thanks to you, it works.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Family therapy for colic.

The excessive crying of colic puts a strain on the most loving family—and often on their physician as well. And whatever the cause of colic, one fact is clear:

Gas is often part of the colic problem.

New Phazyme Drops contains simethicone, which can safely break up gas and bring baby relief. That's why it can help whenever colic is a problem.

Significantly reduces crying of colicky infants.[1]

p values (active vs. placebo) NS = Not significant •$p < 0.05$ †$p < 0.02$ ‡$p < 0.01$

Double-blind, randomized, placebo-controlled study.

Priced 25% below the leading brand.

This significant price advantage will be particularly important to parents, since they may be relying on Phazyme Drops for up to three months. And it's naturally flavored—something else they'll appreciate.

NEW **Phazyme®** **Drops** (simethicone/antigas)

Helps you through the colic phase.

1990 - The Year of the Infant

In January, Governor William Donald Schaefer declared 1990 the Year of the Infant in Maryland. A major focus of this statewide campaign is to help insure that children in Maryland are born healthy and stay healthy throughout their formative years.

The initiatives set forth in this statewide program set precedents for state involvement on a wide range of health issues of which physicians should be aware and a part, including creation of a national model infant center focusing on prevention and early intervention, housing for infants and children with AIDS, a model infant day care center for state employees, and enhancement of drug treatment programs to improve maternal health and to decrease infant mortality. Dr. Brodell's article on page 290 sheds light on specific issues physicians can be involved in.

Med Chi's Infant, Child and Adolescent Health Subcommittee is dedicated to the health of Maryland's youngest citizens during The Year of the Infant and every year. Our committee thoroughly supports this statewide campaign with the hope that improving the health of our children will make a better future.

We emphasize that funding for current programs such as Maternal Health and Family Planning, Child Health, and High Risk Maternal Referral Services needs to be continued. To reduce any service continuity provided to women and infants could place even more babies at risk. We are trying to help with new programs for long-term development; it would be taking a step backward for the state to reduce existing programs.

RONALD L. GUTBERLET, Chairperson
Infant, Child and Adolescent Health Subcommittee

On the cover is 13-month-old Dorian Boyd at St. Joseph Hospital Day Care Center.

Can One Insurance Agency Handle All Of Your Policies?

Contemporary Insurance Services:

* Is prepared to advise you concerning all malpractice insurers and can place your coverage with any company
* Carries very low cost term insurance and high-grade universal and whole life products
* Carries excellent disability, overhead and buy-sell products with liberal policy definitions and competitive rates
* Carries excellent health insurance products
* Carries excellent office liability products

Contemporary Insurance Services is one of the largest brokers of malpractice insurance to Maryland physicians. Many of our clients rely on us for all of their insurance needs. Let us show you why many of our clients prefer to handle all of their insurance needs through one agent.

In today's market, you need an insurance broker you can rely on. For more information, complete and return:

Current Treatment Guidelines for Sexually Transmitted Diseases

The Centers for Disease Control published updated treatment guidelines for Sexually Transmitted Diseases (STD) in Morbidity and Mortality Weekly Report, September 1, 1989 Vol. 38, No. S-8.

In the last two issues we provided the treatment guidelines for early, late latent, cardiovascular and neurosyphilis, a protocol for syphilis diagnosis and treatment, guidelines for Penicillin Therapy, Jarisch-Herxheimer reaction, Persons Exposed to Syphilis, Syphilis in Pregnancy, Congenital Syphilis and Syphilis in HIV-infected Patients. In this issue, we will provide, abstracted from the above cited MMWR, guidelines for treatment of gonococcal infections. The 1989 Sexually Transmitted Diseases Treatment Guidelines have been reprinted in their entirety and are available from the local health departments.

Gonococcal Infections

Treatment of gonococcal infections in the United States is influenced by the following trends: 1) the spread of infections due to antibiotic-resistant *N.gonorhoeae*, including penicillinase-producing *N. gonorrhoeae* (PPNG), tetracycline-resistant *N. gonorrhoeae* (TRNG), and strains with chromosomally mediated resistance to multiple antibiotics; 2) the high frequency of chlamydial infections in persons with gonorrhea; 3) recognition of the serious complications of chlamydial and gonococcal infections; and 4) the absence of a fast, inexpensive, and highly accurate test for chlamydial infection.

All gonorrhea cases should be diagnosed or confirmed by culture to facilitate antimicrobial susceptibility testing. The susceptibility of *N. gonorrhoeae* to antibiotics is likely to change over time in any locality. Therefore, gonorrhea control programs should include a system of regular antibiotic sensitivity testing of a surveillance sample of *N. gonorrhoeae* isolates as well as all isolates associated with treatment failure.

Because of the wide spectrum of antimicrobial therapies effective against *N. gonorrhoeae*, these guidelines are *not* intended to be a comprehensive list of all possible treatment regimens.

Treatment of Adults

Uncomplicated Urethral, Endocervical, or Rectal Infections

Single-dose efficacy is a major consideration in choosing an antibiotic regimen to treat persons infected with *N. gonorrhoeae*. Another important concern is coexisting chlamydial infection, documented in up to 45% of gonorrhea cases in some populations. Until universal testing for chlamydia with quick, inexpensive, and highly accurate tests becomes available, persons with gonorrhea should also be treated for presumptive chlamydial infections. Generally, patients with gonorrhea infections should be treated simultaneously with antibiotics effective against both *C. trachomatis* and *N. gonorrhoeae*. Simultaneous treatment may lessen the possiblity of treatment failure due to antibiotic resistance.

Recommended Regimen

Ceftriaxone 250 mg IM once

plus

Doxycycline 100 mg orally 2 times a day for 7 days.

Some authorities prefer a dose of 125 mg ceftriaxone IM because it is less expensive and can be given in a volume of only 0.5 ml, which is more easily administered in the deltoid muscle. However, the 250-mg dose is recommended because it may delay the emergence of ceftriaxone-resistant strains. At this time, both doses appear highly effective for mucosal gonorrhea at all sites.

Alternative Regimens

For patients who cannot take ceftriaxone, the preferred alternative is **Spectinomycin** 2 g IM, in a single dose (*followed by* **doxycycline**).

Other alternatives, for which experience is less extensive, include **ciprofloxacin*** 500 mg orally once; **norfloxacin*** 800 mg orally once; **cefuroxime axetil** 1 g orally once with **probenecid** 1 g; **cefotaxime** 1 g IM once; and **ceftizoxime** 500 IM once. All of these regimens are *followed by* **doxycycline** 100 mg orally, twice daily for 7 days. If infection was acquired from a source proven *not* to have penicillin-resistant gonorrhea, a penicillin such as **amoxicillin** 3 g orally with 1 g **probenecid** *followed by* **doxycycline** may be used for treatment.

Doxycycline or tetracycline alone is no longer considered adequate therapy for gonococcal infections but is added for treatment of coexisting chlamydial infections. Tetracycline may be substituted for doxycycline; however, compliance may be worse since **tetracycline** must be taken at a dose of 500 mg 4 times a day between meals, whereas **doxycycline** is taken at a dose of 100 mg 2 times a day without regard to meals. Moreover, at current prices, tetracycline costs only a little less than generic doxycycline.

***Quinolones, such as ciprofloxacin and norfloxacin, are contraindicated during pregnancy and in children 16 years of age or younger.**

For patients who cannot take a **tetracycline** (e.g., pregnant women), **erythromycin** may be substituted (**erythromycin** base or stearate at 500 mg orally 4 times a day for 7 days *or* **erythromycin ethylsuccinate**, 800 mg orally 4 times a day for 7 days). See "Chlamydial Infections" for further information on management of chlamydial infection.

Special Considerations

All patients with gonorrhea should have a serologic test for syphilis and should be offered confidential counseling and testing for HIV infection. Most patients with incubating syphilis (those who are seronegative and have no clinical signs of syphilis) may be cured by any of the regimens containing β-lactams (e.g., ceftriaxone) or tetracyclines.

Spectinomycin and the quinolones (ciprofloxacin, norfloxacin) have not been shown to be active against incubating syphilis. Patients treated with these drugs should have a serologic test for syphilis in 1 month.

Patients with gonorrhea and documented syphilis and gonorrhea patients who are sex partners of syphilis patients should be treated for syphilis as well as for gonorrhea.

Some practitioners report that mixing 1% lidocaine (without epinephrine) with ceftriaxone reduces the discomfort associated with the injection (see package insert). No adverse reactions have been associated with use of lidocaine diluent.

Management of Sex Partners

Persons exposed to gonorrhea within the preceding 30 days should be examined, cultured, and treated presumptively.

Follow-Up

Treatment failure following combined **ceftriaxone/doxycycline** therapy is rare; therefore, a follow-up culture ("test-of-cure") is not essential. A more cost-effective strategy may be a reexamination with culture 1-2 months after treatment ("rescreening"); this strategy detects both treatment failures and reinfections. Patients should return for examination if symptoms persist after treatment. Because there is less long-term experience with drugs other than ceftriaxone, patients treated with regimens other than ceftriaxone/doxycycline should have follow-up cultures obtained for 4-7 days after completion of therapy.

Treatment Failures

Persistent symptoms after treatment should be evaluated by culture for *N. gonorrhoeae*, and any gonococcal isolate should be tested for antibiotic sensitivity. Symptoms of urethritis may also be caused by *C. trachomatis* and other organisms associated with nongonococcal urethritis (see "Nongonococcal Urethritis"). Additional treatment for patients with gonorrhea should be **ceftriaxone**, 250 mg, *followed by* **doxycycline**. Infections occurring after treatment with one of the recommended regimens are commonly due to reinfection rather than to treatment failure and indicate a need for improved sex-partner referral and patient education.

Pharyngeal Gonococcal Infection

Patients with uncomplicated pharyngeal gonococcal infection should be treated with **ceftriaxone** 250 mg IM once. Patients who cannot be treated with ceftriaxone should be treated with **ciprofloxacin** 500 mg orally as a single dose. Since experience with this regimen is limited, such patients should be evaluated with repeat culture 4-7 days after treatment.

Treatment of Gonococcal Infections in Pregnancy

Pregnant women should be cultured for *N. gonorrhoeae* (and tested for *C. trachomatis* and syphilis) at the first prenatal-care visit. For women at high risk of STD, a second culture for gonorrhea (as well as tests for chlamydia and syphilis) should be obtained late in the third trimester.

Recommended Regimen

Ceftriaxone 250 mg IM once

plus

Erythromycin base* 500 mg orally 4 times a day for 7 days.

Pregnant women allergic to β-lactams should be treated with **spectinomycin** 2 g IM once (*followed by* **erythromycin**). Follow-up cervical and rectal cultures for *N. gonorrhoeae* should be obtained 4-7 days after treatment is completed.

Ideally, pregnant women with gonorrhea should be treated for chlamydia on the basis of chlamydial diagnostic studies. If diagnostic testing is not available, treatment for chlamydia should be given. Tetracyclines (including doxycycline) and the quinolones are contraindicated in pregnancy because of possibly adverse effects on the fetus. Treatments for pregnant patients with chlamydial infection, acute salpingitis, and disseminated gonorrhea in pregnancy are described in respective sections.

Disseminated Gonococcal Infection (DGI)

Hospitalization is recommended for initial therapy, especially for patients who cannot reliably comply with treatment, have uncertain diagnoses, or have purulent synovial effusions or other complications. Patients should be examined for clinical evidence of endocarditis or meningitis.

Recommended Regimens - DGI Inpatient

Ceftriaxone 1 g, IM or IV, every 24 hours

or

Ceftizoxime 1 g, IV, every 8 hours

or

Cefotaxime 1 g, IV, every 8 hours

Patients who are allergic to β-lactam drugs should be treated with **spectinomycin** 2 g IM every 12 hours.

***Erythromycin** stearate 500 mg or **erythromycin ethylsuccinate** 800 mg or equivalent may be substituted for erythromycin base.

When the infecting organism is proven to be penicillin-sensitive, parenteral treatment may be switched to **ampicillin** 1 g every 6 hours (or equivalent).

Patients treated for DGI should be tested for genital *C. trachomatis* infection. If chlamydial testing is not available, patients should be treated empirically for coexisting chlamydial infection.

Reliable patients with uncomplicated disease may be discharged 24-48 hours after all symptoms resolve and may complete the therapy (for a total of 1 week of antibiotic therapy) with an oral regimen of **cefuroxime axetil** 500 mg 2 times a day *or* **amoxicillin** 500 mg with clavulanic acid 3 times a day *or*, if not pregnant, **ciprofloxacin** 500 mg 2 times a day.

Meningitis and Endocarditis

Meningitis and endocarditis caused by *N. gonorrhoeae* require high-dose IV therapy with an agent effective against the strain causing the disease, such as **ceftriaxone** 1-2 g IV every 12 hours. Optimal duration of therapy is unknown, but most authorities treat patients with gonococcal meningitis for 10-14 days and with gonococcal endocarditis for at least 4 weeks. Patients with gonococcal nephritis, endocarditis or meningitis, or recurrent DGI should be evaluated for complement deficiencies. Treatment of complicated DGI should be undertaken in consultation with an expert.

Adult Gonococcal Ophthalmia

Adults and children over 20 kg with nonsepticemic gonococcal ophthalmia should be treated with **ceftriaxone** 1 g IM once. Irrigation of the eyes with saline or buffered ophthalmic solutions may be useful adjunctive therapy to eliminate discharge. All patients must have careful ophthalmologic assessment, including slit-lamp examination for ocular complications. Topical antibiotics alone are insufficient therapy and are unnecessary when appropriate systemic therapy is given. Simultaneous ophthalmic infection with *C. trachomatis* has been reported and should be considered for patients who do not respond promptly.

Gonococcal Infections of Infants and Children

Child abuse should be carefully considered and evaluated for any child with documented gonorrhea.

Treatment of Infants Born to Mothers with Gonococcal Infection

Infants born to mothers with untreated gonorrhea are at high risk of infection (e.g., ophthalmia and DGI) and should be treated with a single injection of **ceftriaxone** (50 mg/kg IV or IM, not to exceed 125 mg). Ceftriaxone should be given cautiously to hyperbilirubinemic infants, especially premature infants. Topical prophylaxis for neonatal ophthalmia is not adequate treatment for documented infections of the eye or other sites.

Treatment of Infants with Gonococcal Infection

Infants with documented gonococcal infections at any site (e.g., eye) should be evaluated for DGI. This evaluation should include a careful physical examination, especially of the joints, as well as blood and CSF cultures. Infants with gonococcal ophthalmia or DGI should be treated for 7 days (10 to 14 days if meningitis is present) with one of the following regimens:

Recommended Regimen

Ceftriaxone 25-50 mg/kg/day IV or IM in a single daily dose

or

Cefotaxime 25 mg/kg IV or IM every 12 hours.

Alternative Regimen

Limited data suggest that uncomplicated gonococcal ophthalmia among infants may be cured with a single injection of **ceftriaxone** (50 mg/kg up to 125 mg). A few experts use this regimen for children who have no clinical or laboratory evidence of disseminated disease.

If the gonococcal isolate is proven to be susceptible to penicillin, **crystalline penicillin G** may be given. The dose is 100,000 units/kg/day given in 2 equal doses (4 equal doses per day for infants more than 1 week old). The dose should be increased to 150,000 units/kg/day for meningitits.

Infants with gonococcal ophthalmia should receive eye irrigations with buffered saline solutions until discharge has cleared. Topical antibiotic therapy alone is inadequate. Simultaneous infection with C. trachomatis has been reported and should be considered for patients who do not respond satisfactorily. Therefore, the mother and infant should be tested for chlamydial infection.

Gonococcal Infections of Children

Children who weigh $\geq$45 kg should be treated with adult regimens. Children who weigh $<$45 kg who have uncomplicated vulvovaginitis, cervicitis, urethritis, pharyngitis, or proctitis should be treated as follows:

Recommended Regimen

Ceftriaxone 125 mg IM once.

Patients who cannot tolerate ceftriaxone may be treated with:

Spectinomycin 40 mg/kg IM once.

Patients weighing $<$45 kg with bacteremia or arthritis should be treated with ceftriaxone 50 mg/kg (maximum 1 g) once daily for 7 days. For meningitis, the duration of treatment is increased to 10-14 days and the maximum dose is 2 g. Children $\geq$8 years of age should also be given **doxycycline** 100 mg 2 times a day for 7 days. All patients should be evaluated for coinfection with syphilis and *C. trachomatis*. Follow-up cultures are necessary to ensure that treatment has been effective.

Prevention of Ophthalmia Neonatorum

Instillation of a prophylactic agent into the eyes of all newborn infants is recommended to prevent gonococcal ophthalmia neonatorum and is required by law in most states. Although all regimens listed below effectively prevent gonococcal eye disease, their efficacy in preventing chlamydial eye disease is not clear. Furthermore, they do not eliminate nasopharyngeal colonization with *C. trachomatis*. Treatment of gonococcal and chlamydial infections in pregnant women is the best method for preventing neonatal gonococcal and chlamydial disease.

Recommended Regimen

Erythromycin (0.5%) opthalmic ointment, once

or

Tetracycline (1%) opthalmic ointment, once

or

Silver nitrate (1%) aqueous solution, once.

One of these should be instilled into the eyes of every neonate as soon as possible after delivery, and definitely within 1 hour after birth. Single-use tubes or ampules are preferable to multiple-use tubes.

The efficacy of tetracycline and erythromycin in the prevention of TRNG and PPNG ophthalmia in unknown, although both are probably effective because of the high concentrations of drug in these preparations. Bacitracin is *not* recommended.

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 581-1212. When it comes to curing practice management problems, we are the specialists.

CADO SYSTEMS — WE OFFER PRACTICE MANAGEMENT SOLUTIONS, NOT JUST COMPUTERS!

Medical
and Chirurgical Faculty
of Maryland

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, just call or send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

For many
hypertensive patients

THERAPY THAT MAY BE AS SILENT AS HYPERTENSION ITSELF

VASOTEC is generally well tolerated and not characterized by certain undesirable effects associated with selected agents in other antihypertensive classes.

VASOTEC is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

For a Brief Summary of Prescribing Information, please see the last page of this advertisement.

FOR MANY
HYPERTENSIVE PATIENTS
ONCE-A-DAY

VASOTEC®

(ENALAPRIL MALEATE | MSD)

Copyright © 1990 by Merck & Co., INC

VASOTEC®

(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Patients with heart failure given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed, caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in patients with heart failure), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (>5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness, especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Pregnancy – Category C. There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use of ACE inhibitors has not been clearly defined, VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal outcome adversely. Fetal exposure during the second and third trimesters of pregnancy has been associated with fetal and neonatal morbidity and mortality.

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion with the administration of fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSION: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction, rhythm disturbances: atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis, stomatitis.

Musculoskeletal: Muscle cramps.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Respiratory: Bronchospasm, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection.

Skin: Herpes zoster, urticaria, pruritus, alopecia, flushing, hyperhidrosis.

Special Senses: Blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgias/arthritis, myalgias, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash, and other dermatologic manifestations.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g% and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported. A few cases of hemolysis have been reported in patients with G6PD deficiency.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension.* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

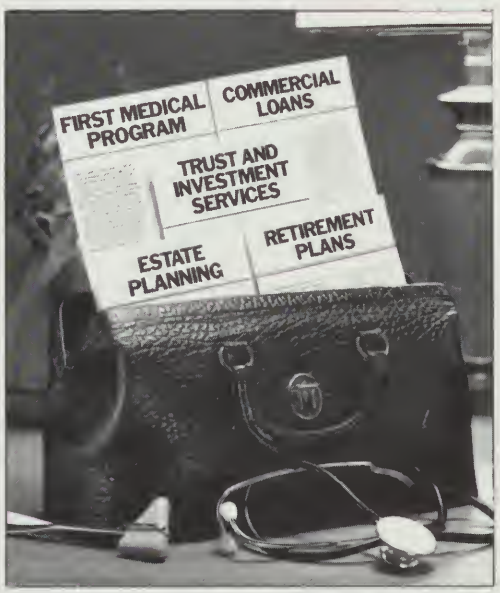
If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance > 30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤ 30 mL/min (serum creatinine ≥ 3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)



Dosage Adjustment in Patients with Heart Failure and Renal Impairment or Hyponatremia: In patients with heart failure who have hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure*, WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

Executive Director's Newsletter

March 1990

New Physicians Credentialing Service

Med Chi and the Maryland Hospital Association (MHA) will be partners in a new nonprofit, freestanding organization, Healthcare Credentials Verification, Inc. — A Cooperative Service of Maryland Hospitals and Physicians. This organization will collect and disseminate the information hospitals need to credential and recredential physicians for medical staff appointment and reappointment. The organization will be governed by a twelve-member board of directors, six members appointed by each of the partners. Joseph Jensen, Med Chi's director of support services on a leave of absence from Med Chi, will coordinate the organization's activities, design the system specifications, and work out the details of implementation. Current plans call for the service to phase in new physician applications and reappointments beginning June 1, 1990. The organization is scheduled to be fully operational by September 1, 1990. Med Chi and the MHA are pleased to offer this cooperative initiative to physicians and hope that this service will improve the efficiency and quality of care both are committed to bring to Maryland citizens.

Maryland Medical Journal Readers' Survey

In an effort to improve service to Med Chi members, this issue of the *MMJ* features a Readers' Survey (following page 278). The *MMJ* is <u>your</u> publication and should reflect your interests and ideas. Please take a moment to fill out and return this survey. Survey findings will be published in a future issue.

1990 Annual Meeting

Mailed to you with this issue of *MMJ* is the preliminary program for Med Chi's 192nd Annual Meeting, "The 1990's: What Can We Expect?" to be held on May 9-11, 1990 at the Turf Valley Hotel and Country Club in Ellicott City. Speakers at the meeting include plenary speaker AMA Trustee Lonnie Bristow MD, Physician Payment Review Commissioner Thomas Reardon MD, Immediate Past-President of the AMA Council on Legislation John Seward MD, Chairman of the AMA Council on Long Range Planning and Development Palma E. Formica, Secretary for the AMA Council on Legislation Ross N. Rubin, Esq., and special guest lecturer Victor A. McKusick MD, Professor of Medical Genetics from The Johns Hopkins School of Medicine. Scientific sessions will cover a wide range of topics such as Managed Care, Breast Reconstruction, Potential Changes in Physician Payment, and Medical Waste. Category I CME credits will be awarded to all physicians attending scientific sessions. Med Chi members who visit the technical exhibits will be eligible to win the Exhibitors Sweepstakes. All physicians attending this meeting

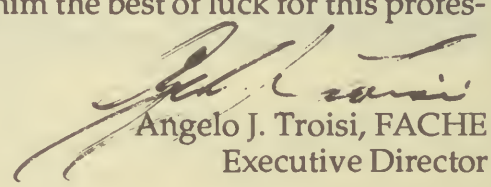
should complete and mail in the registration form on page 19 of the preliminary program.

1990 Semiannual Meeting in Bermuda

The Southampton Princess Hotel in Bermuda will be the site of Med Chi's 1990 Semiannual meeting on September 5-9. The trip includes roundtrip airfare, four nights accommodations at the Southampton Princess Hotel, and daily dinner and breakfast for a cost of $1,010 per person. Med Chi's registration fee for this meeting is $500. To register for the meeting, please complete the registration form (on page 18 of the 1990 Annual Meeting preliminary program) and mail in the Med Chi registration fee and $200 deposit. Deadline for registration is April 1, 1990. For questions about the meeting contact Med Chi's Professional Education and Meeting Management Department at 539-0872 or in MD 1-800-442-1056.

Med Chi Southern Regional Conferences

All members from southern Maryland are invited to attend Med Chi's Southern Regional Conference to be held at the Hawthorne Country Club in La Plata, MD on February 22, 1990 from 4:30 to 8:30 pm. The meeting will feature a message from Med Chi President Raymond M. Atkins MD as well as updates on several medical and legislative issues including malpractice insurance, and prescription drug control, and dispensing. Paul M. Fischer MD, from the Medical College of Georgia will be the plenary speaker for this meeting and will discuss "The Physician's Office Laboratory."



Med Chi thanks Guillermo E. Sanchez MD for his efforts as coordinator of this conference. For more information about the Southern Regional Conference, contact Med Chi's Professional Education and Meeting Management Department at 539-0872 or in MD 1-800-492-1056.

Med Chi Eastern Regional Conference

Physicians from the eastern shore are strongly encouraged to attend Med Chi's Eastern Regional Conference at the Cambridge Yacht Club in Cambridge, MD on March 22, 1990 from 4:30 to 8:30 p.m. Med Chi thanks Paul A. Stagg MD for his efforts in coordinating this program. For more information about this meeting, contact Med Chi's Professional Education and Meeting Management Department at 539-0872 or in MD 1-800-492-1056.

Med Chi's Assistant Executive Director to work at AMA

Med Chi's Assistant Executive Director, Michael A. Murray, will be leaving Med Chi in March to work in the Department of Public Affairs at the AMA in Chicago. Although Mike's talents will be seriously missed, we all wish him the best of luck for this professional advancement.

Angelo J. Troisi, FACHE
Executive Director

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

Standards and Norms in Small Area Analysis

Vahé A. Kazandjian MPH and James Hudson MD

Author Kazandjian is an instructor of Epidemiology and Preventive Medicine, University of Maryland School of Medicine; and Director of Research, Maryland Hospital Association. Dr. Hudson is professor of Epidemiology and Preventive Medicine and Associate Dean of Academic Administration, University of Maryland School of Medicine.

Description of the type and amount of variation in the use of health care services across geographic areas is a well-established method of inquiry encompassing the analysis of both medical and surgical treatment modalities.

The description of the types and amount of variation in the use of health care services across geographic areas is no longer a burgeoning health services research field. It is a well-established method of inquiry that has encompassed the analysis of both medical (acute and chronic) and, especially, surgical treatment modalities. Its underlying purpose is the search for uniformity following the identification of variability among small geographic areas. When variations are identified through comparison of incidence rates in populations of these areas, a number of explanatory factors are posited to be determinants of the variability. There are four groups or families of factors frequently encountered in published research on small area variations in healthcare utilization rates:

- population characteristics
- differential availability of resources across areas
- physician practice style
- the state of medical knowledge

These factors and their importance in understanding the variation in utilization rates in Maryland have been discussed elsewhere.[1] In this article we discuss how state-of-the-art medical knowledge is reflected in the interarea differences in healthcare utilization.

Variations and Definitions

The evolution of medical knowledge in the past few decades has been tremendous. The diagnostic, therapeutic, and palliative panacea available to physicians has opened new frontiers in patient and disease management. Oftentimes, however, a new technology, pharmacopeia, or management strategy have been applied with only partial knowledge of their efficacy, efficiency, and effectiveness. Examples include the protective effect of carotid endarterectomy for stroke; the benefits of total compared to par-

tial mastectomy; the indications for hysterectomy; and, perhaps, the use of aspirin in the primary prevention of coronary heart disease. Pending the results of large-scale clinical trials or case control studies, physicians, both individually and as groups, have applied their philosophies and beliefs about the usefulness of a certain disease or patient management strategy. In general, this phenomenon is assumed to be the underlying reason for differences in physicians' practice styles, whether as individuals or groups of physicians.[2,3]

The inherent potential for variability in the process of providing care is hypothesized for association with differences in the frequency by which specific population groups use various health care services. Population-based outcome rates are captured through epidemiological methods, one of which is small area analysis.

The purpose of small area variation analysis is to calculate health care utilization rates in population groups residing in different geographic areas and to explain these variations based on the four groups of factors just described. For example, if Area 1 has three times more cesarean sections than Area 2, the goal of the analysis will be to identify the healthcare resources (physicians, nurses, number of beds, etc.) in both areas. In addition, characteristics of the population at risk (for example, average age group, educational attainment of women in the child-bearing age group, their income levels, and the number of children per family) would be calculated and included as potential explanatory factors for the differences across areas and cesarean section rates. Finally, it might be useful to identify the medical schools or residency programs from which the practicing physicians received their training. Since differences in physician philosophy and propensity for the use of certain treatment modalities often are associated with differences in the frequencies in application of those modalities, the latter descriptive characteristic may help identify the types and places of training predisposing physicians to certain practice styles.

From the above discussion, we can deduce that the variability among physicians is to be expected given the nonuniform medical evidence relating to the outcome of different treatment modalities, the variability in patients, and, perhaps, the variability of disease across time and place.

The variability in definitions of patient management methods is reflected in how the outcomes of these methods are described and measured.

Standards and Norms

Any scientific discipline has to demonstrate three essential characteristics: replicability, uniformity, and parsimony.

Replicability is a condition that transcends both interpersonal and interstudy variability. If the same technology and knowledge applied in different settings on similar groups of patients produces *variable* results, then the science underlying the use of that technology should be incomplete. To contrast and to evaluate observations that are highly variable require not only an understanding of what affects the phenomenon under consideration but also how is it affected. Thus, linking the nature of the input with the output determines correlations or, sometimes, causality. The identification of any cause-effect relationship is of paramount importance to understanding why a certain manifestation was observed as well as providing the possibility of forecasting future events. The quest for uniformity is, therefore, necessary not only to achieve comparability but also to acquire the predictive power that links the process to the outcome. Finally, parsimony. Achieving similar results through different paths of management and treatment may not always be justifiable. For example, when a dose-response relationship has been discovered between a management strategy and its outcome, efficiency will be reached by eliminating the unnecessary or surfeit management paths even if they lead to a uniform outcome.

It is immediately clear that achieving absolute uniformity when dealing with highly variable entities, such as patients, diseases, settings, and physicians, is indeed a formidable task. In other words, defining *standards* for care based on replicability of the process and outcome across populations, physicians, and regions is the challenge modern medicine seems to have undertaken.

Can standards be achieved? A standard is defined as a nonrelative entity (for example, kilograms, miles, or milliliters). According to Webster's *Dictionary*, a standard is "anything taken by general consent as a basis of comparison." Given the lack of consensus among physicians regarding treatment modalities of numerous health conditions,[4,5] standards of care as described above are not abundant.

Is it possible to have a standard that applies to different physicians, populations, and cultures within the continuously evolving biomedical and sociological sciences? Can a standard for the reasons of hospitalization for pneumonia be determined and accepted by physicians practicing in Florida, Oregon, and Mississippi? Further, shouldn't a true standard in medical science cut across continents, cultures, and time?

The conditions for a standard of care as defined in this article may be difficult to achieve without passing through precursors of standards. One such precursor is the norm. What is a norm? A norm is the most generally accepted definition or description of a phenomenon in the *frame of geography and time*. For example, there might not be a standard length of stay in the United States for uncomplicated cholecystectomy patients, but geographic analysis may indicate that the average for the northeast United States is X days, whereas the average for the southwest United States is Y days. Assuming there are no significant differences across populations (dietary habits,

genetics, etc.), it is possible that most physicians in the Northeast practice according to some regional consensus about the treatment and hospitalization of patients with specific conditions and physicians in the Southwest practice according to another regional set of management philosophy. These regional consensuses can be called *norms of care* that have large followers in the medical and healthcare professions.

It is not uncommon to find the two definitions of a norm and a standard used interchangeably in medical and health services research literature. Such a lack of specificity in definitions makes the interpretation and use of comparative analyses results (for example, small area variation analysis) even more difficult. The distinction between standards and norms is not a juggling act of semantics. A more parsimonious and specific use of those definitions would contribute not only to a better understanding of why different philosophies on the application of patient and disease management modalities exist among physicians across areas but also would facilitate the development of the future steps in consensus building within the medical profession. Perhaps the most successful is a stepwise approach that starts with the identification of local or regional differences in utilization rates.

Such an approach has been tried and has been encouraging. In fact,

> physicians become motivated to undertake serious re-examinations of the scientific basis for their clinical decisions and take actions to obtain more information on the outcome implications of common treatments. Such efforts by academic as well as practicing physicians, hold promise for improving scientific basis of medical practice.[5]

Clearly, the ultimate goal is to improve clinical decision through better assessment of the patterns of delivery of care. The methods used for this end are regional or local reviews of outcome statistics (possibly combining available data sets with new controlled clinical trials) and the development of a uniform set of indications or guidelines. The collected data should be statistically representative of the clinical phenomena under study. Always, according to Wennberg,

> [His] experiences indicate that information and practice variations, when used in a program of feedback that includes epidemiologic, biostatistical, educational, and financial support, motivates practicing physicians to take the necessary steps to improve clinical decision making.[6]

The primary purpose for the development of norms is to provide physicians and other healthcare professionals a benchmark, threshold, or reference point for outcome rates. Through comparison to the reference point, researchers will be able to test the hypothesis that differences in physicians' practice styles result from differences in the application of clinical decision making. Although in this article we stress the fact that physicians will benefit from the findings of small area variation analysis in directing their attention to issues of clinical decision making, sometimes the findings of small area variation analysis indicate that differences in outcome rates most probably result from differences in population characteristics and their abilities to demand services. In fact, as mentioned at the outset and throughout this discussion, patient predisposing factor (cultural, genetic, and other) may explain more about the variation in the use rate in an area than does physician practice style.

Identifying Standards? Norms?

Small area analysis cannot identify standards of care. It can, however, uncover and discover patterns of utilization rates that can be used as reference norms for the most frequently used healthcare services. If the number of areas and repetitive studies identify a very similar pattern of utilization, it becomes worthwhile to investigate the possibility of describing a regional norm. Such an endeavor should be undertaken with extreme caution and through robust statistical methodologies. It always should be kept in mind that geographic analysis of utilization rates describes aggregate patterns and that extrapolation from the aggregate to the individual patient is not possible. This erroneous exercise is referred to as the "ecological fallacy," an interpretation error that can affect any epidemiological study.

If true patterns are consistently reported within a large area, the average pattern can be used as a regional norm to identify aberrant utilization rates. If, through peer review and patient analysis, it is identified that those aberrant observations were due to significant deviations from the regional norms, action would be taken to identify the reasons for those deviations. Without further analysis, the findings of small area analysis cannot be used to reach a decision concerning the desirability of the care provided. Such hastily reached conclusions can become barriers toward the achievement of increasing uniformity and consensus in the application of medical science.

Conclusion

When dealing with patients, physicians, and the evolving nature of medical science, variability in treatment modalities and utilization patterns is expected. Regionally and nationally conducted small area variation analyses of healthcare utilization rates can assist health care providers in determining the extent to which these variations are acceptable. The ultimate challenge is to identify the encroachment of those variations on the appropriateness of care.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc. Will Speed Up Your Billing And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations

Management Systems, Inc.'s "Computer-Side Manner" Is The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

(301) 825-5626

Management Systems, Inc.

7215 York Road, Baltimore, Maryland 21212

WE RESPOND EFFICIENTLY AND QUICKLY TO YOUR NEEDS.

OAKVIEW TREATMENT CENTER

A Center for adolescents and adults that have a problem with alcohol or other drugs.

OAKVIEW TREATMENT CENTER, 3100 NORTH RIDGE RD., ELLICOTT CITY, MD 21043

Peripheral Vascular Disease in Diabetes Mellitus

DeWitt E. DeLawter MD

Dr. DeLawter is Medical Director, Diabetes Education Program, Suburban Hospital, Bethesda, MD.

In caring for diabetic patients, we must broaden our focus beyond just treatment of hyperglycemia and begin to view diseases of the vascular system as critical sites for preventive efforts.

With the discovery and use of insulin almost everyone concluded that diabetes mellitus and its problems had been cured. If properly managed, patients were no longer dying of ketoacidosis. But as people with diabetes lived longer, it became obvious they were prone to infections. With the advent of antibiotics it again appeared that diabetic patients could live as long as their nondiabetic counterparts. It gradually became apparent that with this increased longevity, arteriosclerosis and atherosclerosis were causing more problems in diabetic patients than in the population at large. Now the challenge is to better understand the mechanism of the development of peripheral vascular disease (PVD), the risk factors and their control, and the management of the complications if they occur.

Let us begin our discussion with some definitions:

Atherosclerosis A lesion of large and medium size arteries, with deposits in the intima of yellowish plaques containing cholesterol, lipoid material, and lipophage.

Arteriosclerosis A condition marked by loss of elasticity, thickening and hardening of the arteries.

Arteriosclerosis obliterans Arteriosclerosis of the tunica intima causing obliteration of the artery lumen.

Peripheral arteriosclerosis Arteriosclerosis of the extremities.

Pathophysiology

Atherosclerosis, a process of vascular degeneration, occurs in response to intimal damage. The initial injury may result from hypertension, hyperglycemia, or hyperlipidemia. Platelets in the patient with diabetes have enhanced adhesiveness and a tendency to aggregate, piling up on the injured intima and beginning plaque formation. Circulating lipids allow fat material to enter the gradually enlarging plaque. Finally diabetes may cause general defects in cellular function. Plaque formation finally consists of deposits of lipids, platelets, muscle cells, and debris. With time, plaques slowly enlarge until the passage of blood through the lumen is compromised.[1-4]

Atherosclerosis tends to occur at an earlier age and with greater severity in the diabetic than in the nondiabetic population, matched for other variables. Heart attacks and strokes are about twice and gangrene about five times as likely to occur in patients with overt diabetes than in the general population. Patients with insulin-dependent diabetes appear to have the same degree of risk as those with noninsulin dependent disease. Arteriosclerosis includes those with fatty intimal plaques as well as those with severe diffuse fibrosis.

Arterial Insufficiency

The earliest symptom of arterial insufficiency is the appearance of claudication: a pain, numbness, or aching of the leg brought on by exercise and relieved by rest. The location of the discomfort may be anywhere from the buttock to the foot depending on the location of the occlusion in the artery. With progression of the disease, pain or aching may occur at rest, usually at night, and can be relieved by elevation of the head of the bed or placing the feet in a dependent position, allowing increasing blood volume to reach the extremities. In the presence of neuropathy the pain may be blunted or blurred. Sometimes the patient describes a sensation of wearing socks. Another symptom may be the development of skin necrosis with or without a history of trauma to the area.

Palpation of the pulses from the groin to the ankle will help locate the level of vascular obstruction, if present. The intensity of the pulse can be graded from 4 plus (excellent) to zero (not palpable). If more than 50 percent of a large vessel (aorta, iliac, or femoral) lumen is blocked a thrill may be felt on palpation over the area or a bruit noted if one listens over the area with a stethoscope. If the examiner uses both hands with the fingertips of one overlapping those of the other, it is possible to obtain just the correct amount of pressure without losing an accurate sense of touch. Both the posterior tibial and dorsalis pedis pulses should be easily recognized if the vessels are normal.

Skin temperature Although expensive mechanical devices are available for testing temperature and the location changes in the foot and ankle area, simple palpation and comparison of one extremity with its counterpart is often adequate to locate areas of vascular insufficiency.

Nutrition If the skin appears pale, thin, and there is a diminution of subcutaneous tissue, arterial circulation is poor. The absence of hair growth on the dorsum of the foot and abnormal nail formation are further proof of ischemia and poor nutrition to the area.

Sweating The foot suffering from vascular insufficiency is both cold and dry. If sweating is noted, vasospasm rather than occlusion is probably present.

Rubor on dependency Redness may develop slowly on dependency of the lower extremity if the circulation is poor. This is due to the slow flow of blood in the dilated capillaries beneath the skin.

Venous filling time From the elevated to the dependent position of a leg the venous filling time of more than 20 seconds is a positive sign of arterial insufficiency.

Sensation Lack of sensation is usually due to neuropathy but may accompany sudden arterial occlusion.

Motor power Sudden footdrop or other paralysis may be due to severe vascular occlusion more proximally or neuropathy.

Noninvasive Testing

Oscillometry A instrument (oscillometer) is used to measure the amplitude and strength of pulses over the area being examined. It does not provide any information as to the amount of collateral circulation.

Doppler The Doppler system is a continuous-wave ultrasound system that has been used for noninvasive evaluation of PVD for many years. The instrument directs an ultrasound wave toward the blood vessel. When the wave front strikes a moving object such as a blood cell, the wave is reflected back to the crystal at a different frequency, creating the Doppler effect. The system can be used to study all major peripheral arteries with blood pressures or arterial velocity signals.

The first velocity signal corresponds to the rapid flow of blood during systole and is high pitched. It is followed by a brief second sound that probably represents the flow reversal in early diastole. Finally, the third sound is low pitched as forward flow returns. When a high-pitched, multiphasic signal is audible over a peripheral vessel, significant proximal stenosis or resistance is unlikely.

These signals also can be recorded on a graphic printout. If there is partial stenosis the first sound is blunted and the second and third sounds diminished. If there is complete occlusion, the curve is essentially flat.

The Doppler is also used for measuring blood pressures. Doppler systolic pressures are usually taken over the dorsalis pedis or posterior tibial pulses with the cuff at the ankle. Normal pressures at the ankle will be equal to or slightly greater than the arm pressure. If the ankle pressure is 50 percent or less than the arm pressure, severe PVD is indicated. Doppler pressures used in evaluating the probability of claudication and rest pain also are helpful in predicting the healing of foot lesions.

Segmental blood pressures are used to identify the level or area of obstruction. Segmental pressures are obtained using cuffs placed high on the thigh, above the knee, below the knee, and above the ankle. Measurement of systolic pressure is taken at the dorsalis pedis or posterior tibial pulses. By consecutively inflating the cuffs, segmental pressures can be obtained. All pressure gradients should have a fall of less than 30 mmHg above the brachial pressure. In the presence of aortic or bilateral iliac disease the ankle/arm pressure index will be less than one and all segmental gradients

less than 30 mmHg. In iliac disease only the upper thigh on the affected side will be significantly lower.

At least 5 to 10 percent of diabetic patients with severe PVD may have normal to elevated ankle pressures due to calcified vessels. Ankle pressures in these patients cannot be determined because the vessels are incompressible. Doppler systolic pressures in these patients therefore will erroneously appear normal. The only way to evaluate PVD in such patients is by pulse volume recordings (PVR). PVR also are useful where it is difficult to obtain a pedal Doppler signal. The PVR is a quantitative segmental plethysmograph designed for high sensitivity and oriented toward clinical use. Plethysmography is defined as a measurement of volume change. When this measurement is combined with clinical findings, segmental and limb pressures, and treadmill exercise, firm hemodynamic data are obtained to aid in patient management.

Exercise testing Some patients who suffer from intermittent claudication may have a normal testing pressure index that on exercise will fall below one. It is therefore valuable to include the exercise test as part of the Doppler examination when indicated. A typical exercise test is performed by walking on a treadmill at a speed of 1.5 to 2.5 mph on a 10 percent gradient for three minutes or until forced to stop due to onset of claudication. Pressure measurements are then made in the legs at one-minute intervals. In normal patients the pressure does not fall. In mild to moderate disease, the pressure falls, and it may take three minutes or more for the pressures to return to the baseline.

Reactive hyperemia In patients where a treadmill test would not be indicated, this test may give as much information. With the patient in the supine position a blood pressure cuff above the knee is inflated to 20 mmHg above the systolic arterial pressure. After three minutes the cuff is rapidly deflated and the ankle systolic pressure is measured repeatedly until the ankle pressure returns to the preischemic value. A time of one minute or less is normal; an increased time suggests vascular stenosis.

Invasive Testing and Surgical Treatment

Arteriogram angiography must never be done simply as a test for PVD. It should be done as a preoperative procedure after consultation with a vascular surgeon. Indications are rest pain (or night pain) not due to neuropathy, ulcerations that are not healing despite vigorous care, early or incipient gangrene, and severe PVD confirmed by laboratory studies. The reason for great caution in doing this procedure is to avoid possible complications from administering the contrast material.

Vascular repair Large arteries may be treated by endarterectomy thus restoring blood volume to the extremity. Below the groin, inverted saphenous vein graft is the preferred material to use to bypass obstructing arterial lesions. Where vein material may not be available, Dacron and other materials may be used.

Catheter angioplasty A technique where an inflatable rigid balloon on a flexible catheter is inserted into an artery under radiographic control. The balloon is inflated, and obstructing plaques are split and disrupted along with the underlying media with increase in luminal diameter. Most obstructions have proved to be amenable to catheter angioplasty. Focal lesions and proximal lesions can be treated with greater success and facility than diffuse and distal lesions. Potential complications are dissection, rupture, traumatic occlusion, acceleration of the atherosclerotic process, and distal embolization of plaque debris. Long-term evaluation of this procedure is not yet available.

Peripheral Vascular Risk Factors

Lipids The frequency of hyperlipoproteinemia has been high on the list of risk factors in most clinical studies. Whether hypercholesterolemia or hypertriglyceridemia or both represent the greater risk factor has not been totally evaluated. The relationship between high levels of low density lipoprotein (LDL) cholesterol and atherogenesis is generally well accepted, while high levels of high density lipoprotein (HDL) cholesterol are believed to be helpful in slowing the process. Good control of the blood glucose tends to raise the level of HDL; thus, controlling the blood glucose consistently is a factor in prevention of atherosclerosis through its HDL effect.[6-8]

Hypertension Defined as blood pressure greater than $\geq$140/90 mmHg. Of the currently recognized risk factors for cardiovascular disease, hypertension and diabetes mellitus appear to be the best indicators in predicting cardiovascular problems. The level of blood pressure is governed by the cardiac output and the degree of peripheral vascular resistance. Cardiac output is affected by many factors including stroke volume, heart rate, myocardial contractility, blood volume, and degree of vascular tone. An increase in peripheral vascular resistance without change in blood volume or cardiac output will result in an increase in blood pressure. Systolic hypertension, so frequently observed in elderly diabetic patients, is etiologically related to an accelerated rate of atherosclerosis. Diastolic hypertension occurs when the peripheral vascular resistance is disproportionately elevated in relation to blood volume and cardiac output. Generally the systolic pressure is elevated proportionately, thus maintaining the pulse pressure near normal. The renin-angiotensin-aldosterone system and other hormone components also are factors in maintaining hypertension and electrolyte balance. Elevated serum insulin levels commonly found in insulin resistant obese diabetes may result in or contribute to hypertension.

Age and duration Of all the risk factors in PVD the most important are the age of the patient and the duration of the diabetes. It is uncommon to see significant PVD before the age of 50 years. Duration of the disease is probably more important than age. Severe calcification is twice as common in short-duration diabetes mellitus than in the nondiabetic popula-

tion and four times as common in those with long-duration diabetes.

Blood glucose The overall control of the blood glucose is one of the major risk factors always considered in the development of diabetic vascular disease. Good control is important in the prevention, stabilization, and possible improvement in the problem.[9]

Smoking Clinical experience strongly confirms that patients who smoke and have chronic occlusive arterial disease affecting the extremities do not do well. They have a decreased blood flow to the extremities and a decrease in the skin temperature of the digits. The effect of a single cigarette narrowing the arteries and reducing the blood flow may last as long as an hour. The mechanism by which smoking is atherogenic is unknown. Although some of the adverse cardiovascular effects of smoking are mediated by nicotine, the principal unfavorable consequence of smoking is probably an increased concentration of carboxyhemoglobin and resultant tissue hypoxia.

Physical activity The influence of physical fitness as an independent risk factor in the development of atherosclerosis has long been debated. The protective effect of exercise against atherosclerosis probably involves the reduction of other risk factors in physically active people, for example, hypertension, hyperlipidemia, and insulin insensitivity will benefit immensely from an exercise program if there are no medical contraindications for it. The beneficial effects of exercise are short lived, and chronic adaptation requires sustained physical conditioning.

Sex and sex hormones The relative freedom of nondiabetic premenopausal women to atherosclerosis is believed to be related to a protective effect of estrogen. The role of sex hormones in the pathogenesis of atherosclerosis needs more study.

Obesity Obesity is a minor risk factor in the development of PVD in both the diabetic and nondiabetic population. The underlying factors of hypertension and hyperlipidemia related to obesity are the more serious problems.

Stress and personality Type A personality individuals are chronically impatient, work-oriented, and preoccupied with deadlines; while the type B behavior pattern is characterized by the absence of pressing conflict with time or other persons and a more relaxed pace of activity. The type A personality is more prone to vascular atheromatosis. There is a need for early personality screening and appropriate therapy to help diabetic patients adapt to stress.

Genetic and racial factors Several types of familial disorders of hyperlipoproteinemia with increased propensity to atherosclerosis are inherited, either as monogenic mutant genes or in a more complex polymorphic transmission. Genetic factors in the inheritance of atherosclerosis are most likely determined by the sum of the genetic expressions of various underlying causative or protective mechanisms. Ethnic, dietary, and environmental factors unique to diabetic patients blur the evaluation of these factors.

Treatment

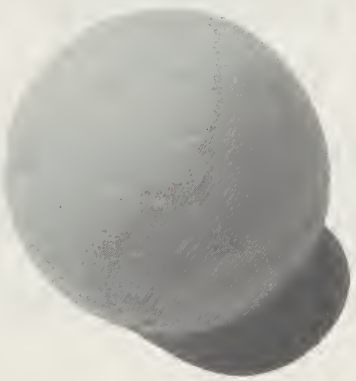
Prophylaxis Early recognition of the possibility of the development of PVD, understanding the problem, and managing the controllable risk factors are essential if complications are to be reduced. If a diabetic patient does not have a good understanding of meal planning, self-monitoring of blood glucose, and the management of diabetes, an intensive education course is essential. No one can control aging and duration of the diabetes. Atherosclerosis begins in the late teens or early twenties, and primary prevention begins with the earliest phase of atheroma formation.[10,11]

Patients with an impaired glucose tolerance or known diabetes should have annual assessments of lipid parameters, renal function (especially with microalbumin measurement) and fundoscopic status, vascular function (for example, with Doppler analyses), and neuropathic status, and perhaps biannual evaluations of the clotting system. Defects in coagulation and blood flow, platelet function, and prostaglandin interaction with platelets and vessel wall certainly have an effect on atherosclerosis. Several drugs such as aspirin, indomethacin, and sulfinpyrazone have had a recent popularity in retarding atherogenesis by inhibiting prostaglandin action.

Drug therapy A variety of medical treatments have been proposed, but none has proved to be of any significant or consistent value. The peripheral vasodilators have been ineffective because the problem is not one of vasospasticity but an anatomical narrowing of the vessels. Drugs that may increase peripheral ischemia should be avoided if at all possible. Dopamine, anticoagulants, and beta-blockers such as propranolol should be used cautiously in patients having PVD.

Sympathectomy This procedure is of no value unless a vasospastic component is discovered during the vascular evaluation.

Summary



The risk for PVD in the diabetic patient represents a combination of factors, the most important being age and the duration of the diabetes, factors which cannot be controlled. While each treatable risk factor may have a low degree of importance in itself the combination of these factors may become very significant.

Every effort should be exerted to keep hypertension, hyperlipidemia, and blood glucose under excellent control. Smoking is absolutely contraindicated.

Finally, in caring for diabetes, we must broaden our focus beyond just treatment of hyperglycemia and begin to view diseases of the vascular system as critical sites for preventive efforts. Rather than wait for vascular complications to occur, it is better to anticipate them and prevent them from happening. Good management of diabetes will bring happiness in life and decreased expense and morbidity.

We Could Give Your Talents Maximum Exposure on the Cover of *MMJ*

Jerrold M. Post MD, 1989 first place winner in the Color Category had his photo published on the December cover of MMJ.

Enter the TENTH ANNUAL MED-CHI PHOTO CONTEST

ENTER EARLY-- Deadline for Entries--APRIL 20, 1990
2 CATEGORIES: Black and White OR Color
First and Second Prizes Awarded in Each Category
Open to MED-CHI Members and Auxiliary Members
All Photographs will be displayed at the *1990 ANNUAL MEETING*
at Turf Valley Hotel and Country Club.

MED-CHI Photo Contest Rules

Eligibility

All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

Contest Rules

1. Photographs may be submitted in two categories-- Black and White or Color.
2. Limit: three entries per person
3. Prints only, no smaller than 8x10 or larger than 11x14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on Friday, April 20, 1990.
7. Photographs entered in the contest will be on display at the Annual Meeting in May of 1990.
8. Prizes will be awarded to the FIRST AND SECOND place winners. Additional information about the prizes will be published in the Journal.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, May 9-11, 1990.
10. Photographs will NOT be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting at noon on Friday, May 11, or at the Faculty Building thereafter.
11. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

Brain Injured Patients: Comorbidities and Ancillary Medical Requirements

John B. Parkerson, Jr., MD, MS; Zachary Taylor MD, MS; and James P. Flynn MD, MPH

Drs. Parkerson and Taylor were residents in the Department of Epidimiology and Preventive Medicine, University of Maryland School of Medicine. Dr Flynn is Acting Director of MIEMSS; Director/Chief Executive Officer, Montebello Rehabilitation Hospital; as well as with the Department of Epidimiology and Preventive Medicine, University of Maryland School of Medicine, Baltimore.

Traumatic brain injuries are medically and economically devastating conditions. Rehabilitation may be affected by premorbid factors such as substance abuse and violence. Successful rehabilitation is an ongoing process.

Death and disability due to head trauma are significant problems in the United States. It is estimated that there are 300 head injuries per 100,000 population each year in the United States.[1] Head injury may result in up to $12.5 billion in direct and indirect costs to society.[2]

Rehabilitation of head-injured patients is an integral part of their total management. Evaluation of the results of rehabilitation is hindered by not taking into account pretrauma factors associated with risk of head injury that impair recovery. Factors such as previous neurological disease, alcoholism, age, previous head injury, and prior significant psychiatric problems may lead to an overestimation of head-injury deficits.[3] Accurate prognosis in the rehabilitation of head-injured patients is therefore often difficult to predict because it is unknown how well the brain functioned before the injury. The relative success of rehabilitation may be related more to the pretrauma level of mental and psychological functioning than to the severity of the injury.[4]

Pretrauma factors found to be related to injury are age, alcohol intoxication, experience, and judgment.[5] The abuse of alcohol and impaired judgment may indicate psychosocial dysfunction, which may have an effect on the course of rehabilitation. For instance, Lyons *et al.*, in a study of 321 head- and spinal-cord injured patients found that 13.1 percent required psychiatric consults and that those patients with psychiatric consults had longer lengths of stay.[6]

Montebello Rehabilitation Hospital, a 183 bed comprehensive rehabilitation hospital, is part of the University of Maryland Medical System. This study examined characteristics of brain-injured patients referred to MRH to determine premorbid demographic characteristics, types of complications, and the consultations they required. Other goals were to provide a basis for utilization planning and to suggest preventive strategies.

Methods

A survey was conducted as a chart review in Spring 1988. A standard form was developed that included demographic data (age, sex, race, education, marital status, address), length of stay, discharge diagnoses, pulmonary/bladder/bowel function on admission and discharge, medications on admission and discharge, types and numbers of complications, and types and numbers of consultations. Abstraction involved review of the admission face sheet, admission team evaluation, social worker evaluations, progress notes written by physicians, nurses, and therapists, consultations, and the discharge summary. A patient was considered to have a consult if there was a completed consult form in the chart. Records were coded by the hospital chart number and did not include any personal identifiers.

The study population consisted of all patients who were discharged from the MRH Head Trauma Unit during calendar year 1986. These patients were retrieved from a master list of all discharges by service. There were 89 cases included.

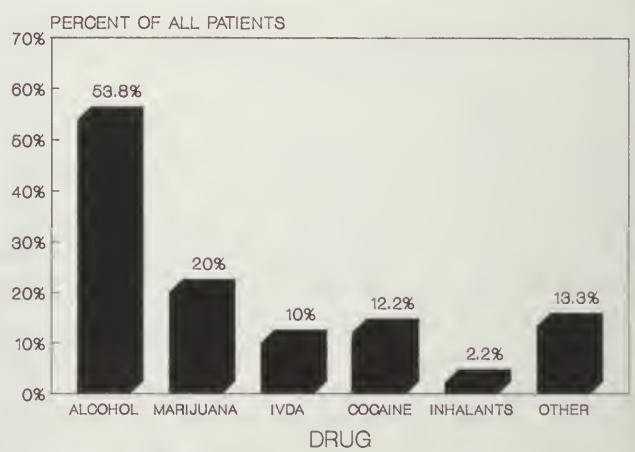
Abstracted data was coded and entered into a dBASE III[7] computer file that was then translated into a SAS[8] database. The SAS statistical package was used to calculate frequencies of the variables of interest.

Findings

Demographics The average age of the patients on the head trauma unit was 33 years. Of the 89 patients, the majority were white (62.2 percent) and male (85.6 percent) (Table.). Most had less than a high school education (52.2 percent). Approximately 20 percent of the patients were married or had been married while most (54.4 percent) were single. The insurance coverage of the patient population ranged from state medical insurance, with 56.2 percent either on medical assistance or with an active application, to some form of private insurance coverage (42.2 percent).

Premorbid Factors Significant numbers of these patients had a history of alcohol abuse or illicit drug use prior to their injury. More than half of the patients (53.8 percent) had a history of alcohol abuse. Marijuana had been used by 20 percent, 10 percent admitted to IV drug use, 12.2 percent had used cocaine, 2.2 percent had used inhalants, and 13.3 percent admitted to using other drugs (Figure 1). In addition to current drug use, a history of a previous head injury was reported in 22.2 percent of the patients. Twenty-five patients (28.1 percent) also had a history of a previous neurological dysfunction.

The social worker's initial evaluation found that a large majority of the patients did have some form of family support (77.5 percent). Almost half the sample (48.9 percent) also had evidence of nonfamily support documented in the social worker's evaluation. Thirty-three patients (36.7 percent) were unemployed at the time of their accident, forty-three (47.8 percent) were employed, and six (6.7 percent) were disabled. The remainder of the patients were students, retired, or the data were missing.



The cause of injury varied among the patients, with the largest number resulting from motor vehicle accidents (42.2 percent) (Figure 2). An additional 16 (17.8 percent) resulted from blunt trauma, 12 (13.3 percent) from motorcycle accidents, 10 (11.1 percent) from falls, 9 (10 percent) from gunshot wounds, and the remainder from miscellaneous causes. Sixteen (17.8 percent) of the patients were using drugs at the time of their injury, and 34 (37.8 percent) were using alcohol. Fifteen of the patients (16.7 percent) were victims of crimes, with seven (7.8 percent) injured as a result of domestic violence. Five patients (5.6 percent) were injured in suicide attempts. Only one patient was the passenger in a car involved in a motor vehicle accident, but ten (11.1 percent) were pedestrians.

Acute Hospitalization The majority of patients were admitted from MIEMSS (70.8 percent) and other Baltimore City hospitals (18 percent). Five patients were admitted from other Maryland hospitals and three from out of state. Data concerning date of acute hospitalization were missing on two patients. The average length of stay in the acute hospital was 36 days.

Montebello Hospitalization The admission team evaluation of each patient commonly included an estimated length of stay of 4 to 6 weeks. The actual length

Table. Demographic Data

Factor		Frequency	Percent
Race			
	White	56	62.2
	Black	33	36.7
	Other	1	1.1
Gender			
	Male	77	85.6
	Female	13	14.4
Education			
	Less than H.S.	18	20.0
	High School	29	32.2
	Completed H.S.	33	36.7
	More than H.S.	10	11.0

Some patients used multiple drugs

Figure 1. Pre-Morbid Drug Use

of stay (tabulated retrospectively on discharge) averaged 47 days.

On admission to Montebello, twelve patients required a tracheostomy. At the time of discharge, seven continued to have a tracheostomy. Bladder management on admission involved an external catheter in twelve patients, an ostomy in three patients and an indwelling catheter in one patient. Nine patients were reported to be incontinent of urine in the nursing admission notes. On discharge, two patients had indwelling catheters, two patients were reported to be incontinent, and three patients continued to have external catheters. Fourteen patients were incontinent of feces on admission to the hospital, but only two remained incontinent at the time of discharge. The change in bowel and bladder function was statistically significant ($p < 0.05$) (Figure 3).

Thirty-four patients (37.8 percent) developed a complication during their MRH admission. Infections were the most common complication with urinary tract infections accounting for 13.3 percent of all complications. Wound and skin infections and pneumonia were responsible for 7.7 percent and 4.4 percent of all complications, respectively.

Consultations Almost all the patients (N = 88) received a consultation during their hospitalization. Neuropsychiatric (70 percent), dental (65.6 percent), and podiatric (14.4 percent) consultations are performed as routine services on most brain-injured patients. Additionally, most patients will be treated by physical, occupational, and/or speech therapy. Thirty-six patients (40 percent) required an orthopedic consult, 29 (32.2 percent) required a psychiatric consult, and 26 (28.9 percent) required an ophthalmology consult. Consultations also were requested from otolaryngology, internal medicine, general surgery, urology, and neurosurgery physicians.

Status at Discharge Eighty patients returned to the community upon discharge from the MRH. Forty required an appliance, most frequently a wheelchair (15 patients). Forty three patients were referred to outpatient services (physical/occupational/speech therapy and/or home care agencies). The number of patients requiring medications did not change substantially from admission to discharge.

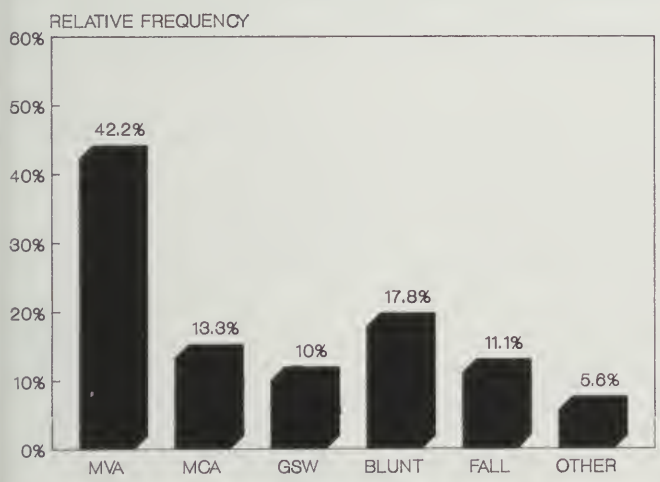
Discussion

Patients who are admitted at Montebello Rehabilitation Hospital after lengthy acute care hospitalizations exhibit a wide range of physical and cognitive dysfunctions. This is particularly evident when the numbers and types of consultations needed by the patients are examined. Patients are able to come to Montebello and begin therapy before they have completely recovered from their acute injuries because of the availability of consultants in surgical and medical specialties.

The study emphasizes that many brain-injured patients may have prior cognitive and psychiatric disabilities that affect their rehabilitation. Most patients had not completed a high school education. It is not surprising that many of them have significant histories of drug and alcohol abuse, as these substances played a part in many of the accidents resulting in their head trauma. This study did not have the appropriate denominator data to determine whether the percentage of patients with substance abuse may reflect use in the general population. However, these patients not only need therapy for their injuries but also may require intensive behavioral and cognitive therapy to begin a healthier life. The need for behavioral therapy and psychiatric care does not end when they are discharged from the hospital. Successful rehabilitation is an ongoing process.

The average patient underwent over six weeks of intensive rehabilitation. Although most of the patients had some form of support from family or friends, they could not have been discharged to home or the community from the acute care hospital. The stay at MRH enables most patients to recuperate to a point where this was possible.

Primary prevention may result in fewer head injuries. Programs that prevent and treat substance abuse, stricter "driving-under-the-influence" laws, and



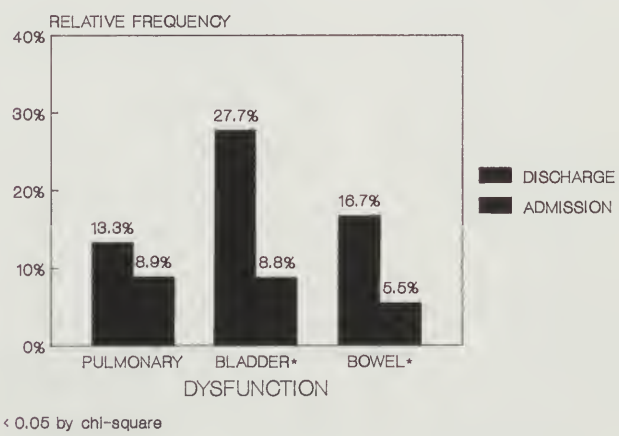


Figure 2. Cause of Injury

*P < 0.05 by chi-square

Figure 3. Change in Medical Status During Rehabilitation

stricter enforcement of present laws may result in fewer brain-injured patients. The large number of motor vehicle and motorcycle accidents indicates a need for prevention of accidents and injuries through driver education, enforcement of seat belt laws, and enactment of helmet laws. The number of injuries that resulted from interpersonal violence, particularly domestic violence, was disturbing. Efforts to curb spousal abuse and to reduce the level of violence in our society also could have an impact on the number and severity of head injury patients.

Conclusion

Behavioral and lifestyle factors may have led to the brain injuries sustained by patients in the Montebello Rehabilitation Hospital Head Trauma unit. These same factors make rehabilitation outcome somewhat less predictable. A significant number of brain-injured patients undergoing rehabilitation suffered complications requiring subspecialty care from many other fields in addition to the rehabilitation specialist.

Presents

Baltimore County Professional Building

Location	:	Barry Paul Road just off Old Court Road near the intersection of Liberty Road and down the street from Baltimore County General Hospital.
Total Square Footage	:	10,320 square feet, minmum bay size is 1,720 square feet
Rental Rate	:	$12.00 per square foot net
Additional Expenses	:	Taxes, building insurance and common area charges are the responsibility of the Tenant. Expenses are estimated to be $2.00 per square foot.
Utilities	:	Tenant will be separately metered and responsible for its own utilities.
Ocupancy	:	Immediate
Term of Lease	:	A minimum of three (3) years. Five year terms or longer are preferred.
Amenities	:	Individual entrances, restroom facilities, heating/air conditioning controls in each suite.

NOW LEASING

SEVEN WAYS TO SHARPEN YOUR MEDICAL SKILLS.

The Army Reserve offers a number of highly specialized medical courses you can't always get in civilian hospitals—with the kind of flexibility your busy schedule demands. Here is just a sampling of the unique training programs available to you in the Army Reserve.

COMBAT CASUALTY CARE Prepares you for treating trauma patients in your civilian career. Learn how to live, survive, and function in challenging environments.

ADVANCED TRAUMA/LIFE SUPPORT Teaches you how to treat trauma patients during the critical first hour of injury. Sponsored by the American College of Surgeons.

ADVANCED BURN LIFE SUPPORT Teaches you how to treat and manage the unique characteristics of the burn patient. Sponsored by the American Burn Association.

ADVANCED CARDIAC LIFE SUPPORT Centers upon the treatment and life-saving intervention associated with the acute cardiac patient. Sponsored by the American Heart Association.

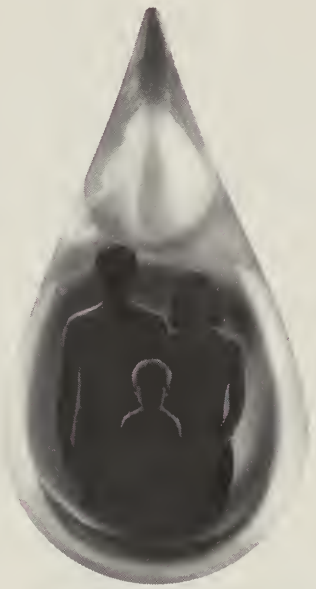
TROPICAL MEDICINE Provides you with advanced in-depth training in parasitology, infectious diseases occurring in tropical and other areas of the world, and other related topics.

FLIGHT SURGEON Gives you a working knowledge of aviation medicine in a course that offers opportunities for frequent operational flights.

AVIATION MEDICINE Offers you a follow-up to the Flight Surgeon course and includes air ambulance operations, airfield operations, and aeromedical research.

Join a local medical unit and serve as few as 16 hours a month and 14 days of active duty during the year. The time you serve can be scheduled around your busy private practice.

You might also have the opportunity to participate in our Individual Mobilization Augmentee Program and serve just two weeks each year.



If you would like more information about these or other medical opportunities, or would like to be contacted by an Army Reserve physician, call 1-800-USA-ARMY.

ARMY RESERVE MEDICINE. BE ALL YOU CAN BE.®

Pneumothorax: An Unusual Manifestation of a Bronchial Carcinoid

Robert B. Wagner MD and Gaylord S. Knox MD

From the Departments of Surgery (RBW) and Radiology (GSK), Greater Laurel-Beltsville Hospital, Laurel, MD. Dr. Wagner is Clinical Associate Professor, Uniformed Services University of Health Science, Bethesda.

Although pulmonary hyperinflation is a recognized manifestation of endobronchial tumors, extreme hyperinflation culminating in pneumothorax is extremely rare. We report a case of an endobronchial carcinoid tumor that acted as a check valve presenting as a pneumothorax in an elderly woman. The obstruction was relieved by resecting the tumor utilizing the flexible fiberoptic bronchoscope.

Long-term successes in treating carcinoid tumors suggest that in poor-risk patients endobronchial resection, when possible, be considered the treatment of choice.

Case Report

A frail, obese 68-year-old woman presented to Greater Laurel-Beltsville Hospital with a one-day history of severe shortness of breath. Breath sounds were diminished on the left, and a chest film confirmed a moderate pneumothorax (Figure 1). Ten days prior to admission, the patient had complained of chest pain and moderate shortness of breath. A chest film taken at that time was interpreted as showing an infiltrative process in the left upper lobe.

Two years prior to this admission she underwent a cholecystectomy at another hospital. The postoperative course was complicated by pulmonary insufficiency, atelectasis, and acute renal failure. During that hospitalization a therapeutic bronchoscopy was performed to relieve "secretions." No endobronchial tumor was noted.

Following the present admission a closed thoracostomy was performed to relieve the pneumothorax. It was partially evacuated, but a posterior loculation of air remained (Figure 2). Because of the incomplete re-expansion of the lung, flexible fiberoptic bronchoscopy was performed. At bronchoscopy, which was performed under topical anesthesia, a large, smooth, pedunculated tumor was seen just opposite the orifice of the left upper lobe bronchus (Figure 3 A). With inspiration the bronchus enlarged slightly, allowing air to enter, however, at expiration the tumor completely occluded the bronchus. The tumor was biopsied revealing benign bronchial epithelium. Because the patient be-

came quite dyspneic and cyanotic during the procedure, it was terminated after the first biopsy.

Three days later, under general anesthesia, using the flexible fiberoptic bronchoscope, the tumor was again visualized and almost completely resected. Moderate (20 mls) bleeding was encountered. The histology was that of a bronchial adenoma, carcinoid type with typical features. The pneumothorax improved, but some posterior loculation remained. A week later the patient was re-bronchoscoped revealing that 85 percent of the tumor had been removed. The posterior loculated pneumothorax was aspirated, and she was discharged several days later.

The patient remained well and was re-bronchoscoped five months later. No evidence of endobronchial tumor enlargement (Figure 3 B) could be seen. The base of the tumor was rebiopsied and trimmed. Since the bronchus had remained at least 85 percent patent, no further surgery other than follow-up bronchoscopy was planned. The patient died of a cerebrovascular accident a year and a half after the endobronchial resection. Autopsy was not obtained.

Discussion

Unilateral pulmonary hyperinflation has long been recognized to be a manifestation of incomplete bronchial obstruction, be it foreign body or tumor.[1] Extreme hyperinflation resulting in subpleural alveolar rupture and pneumothorax is an unusual but logical sequella. To our knowledge, this is the first reported case of this phenomenon subsequent to a carcinoid tumor.

Chevalier Jackson, in writings that date back to

Figure 1. PA chest demonstrates a left pneumothorax (arrowheads). In addition a soft tissue mass measuring 12 mm in diameter is seen (arrow) in the left main bronchus.

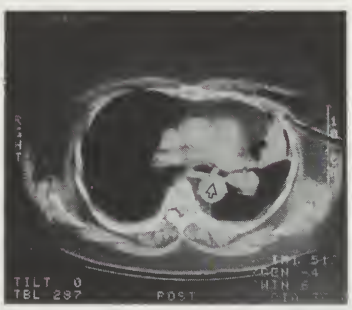

Figure 2. Computed tomography of the chest two days after admission. Axial CT section through a level just below the tracheal bifurcation demonstrates a discrete, well defined mass (arrow) in the left main bronchus. A chest tube has been inserted into the left hemithorax. Collapse of the lingula is seen.

Figure 3A. Bronchoscopic view of the polypoid tumor completely occluding the left main bronchus.

Figure 3B. Bronchoscopic view of the distal left main bronchus five months after bronchoscopic resection. Minimal residual tumor (arrow) is seen.

1917[2,3] thoroughly explained the mechanism of the pulmonary hyperinflation caused by the check-valve action of the flapping motion of a pedunculated endobronchial tumor. He attributed the hyperinflation (he used the term emphysema) to imperfect seating of the flapping tumor allowing air to get below it during inspiration and a reverse check-valve action during expiration producing hyperinflation. In his last book (1950),[3] he emphasized why this mechanism is properly termed a check valve (as opposed to a ball valve).

There is general agreement in the literature that complete resection of carcinoid tumors, with conservation of pulmonary parenchyma, is the treatment of choice for the typical carcinoid.[4] However, as in all of medicine, patients must be individualized. In our case the patient would not have tolerated a major intrathoracic procedure. Therefore, endobronchial resection, utilizing the flexible fiberoptic bronchoscope,[5] was performed. The clinical result was excellent. Endobronchial resection of carcinoid tumors almost identical to ours were reported by Jackson[2] with a 35-year follow-up reported in his 1950 monograph[3] and by Lawson[6] with a 15-year successful follow-up. Jackson's case, as did ours, radiographically alternated between atelectasis and hyperinflation, but his case did not progress to pneumothorax. These long-term successes are encouraging and suggest that in poor-risk patients (such as ours) endobronchial resection, when possible, be considered the treatment of choice.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

TO SCHEDULE APPOINTMENTS FOR YOUR PATIENTS, CALL US AT (301) 725-8995.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

Epidemiologic Classics

Theodore E. Woodward MD, MACP

Dr. Woodward is Professor of Medicine Emeritus, University of Maryland School of Medicine. This material originally was presented as a talk to the Preventive Medicine officers at the Walter Reed Army Institute for Medical Research, Bethesda.

Epidemiology is the study of the relationships of the various factors determining the frequency and distribution of disease in a human community; the field of medicine concerned with the determination of the specific causes of localized outbreaks such as hepatitis, ..., or any other disease of recognized etiology.

Dorland's Medical Dictionary

Epidemics are natural phenomena concerning human communities. We cannot repeat them at will in order to study the mechanism of their occurrence. We must treat them as experiments conducted by nature for us to observe and interpret. (Poster display, All India Institute, Calcutta)

Yellow Fever

One of the best examples of this concept is that of Henry Rose Carter's contribution in helping unravel the evidence that the domestic mosquito, *Aedes aegypti*, was the vector of yellow fever. Although the yellow fever story and the contribution of the Reed Commission has been retold many times, the work of Carter, perhaps one of the most astute of all epidemiologists in providing key evidence, is unheralded and virtually unknown.

Carter graduated from the University of Virginia planning to be an engineer. A badly fractured leg directed him to study medicine. In 1878, along with his classmate William Councilman, he graduated in medicine from the University of Maryland School of Medicine. (Councilman made his mark in many fields, including a major finding in the pathologic changes in yellow fever.) Carter entered the Public Health Service and was assigned to Louisiana as Quarantine Officer for several off-shore Gulf Islands. Yellow fever was rampant there, and his tour of duty extended from 1879 to 1898, broken for only short periods when his services were required elsewhere. The accepted concept to explain the transmission of Yellow Jack was the fomites theory that the agent was spread to humans through the air from contaminated clothes, personal effects, or other objects.

Carter questioned this widely held explanation and began his careful epidemiologic sleuthing. Ships coming to the gulf ports originated in such notorious yellow fever havens as Rio, Santiago, Havana, and Vera Cruz. Ships' captains and others told Carter of a rather uniform pattern of illness among their crews. Soon after leaving port in Central or South America, cases of yellow fever

Henry Rose Carter, Graduate, University of Maryland School

occurred. In cruises of less than two weeks, there was no second clustering of yellow fever cases. Carter noted this strange event repeatedly. He carefully questioned customs and baggage inspectors and found not one instance of yellow fever in those who handled clothes and personal items. Moreover, a retrospective study of the quarantine and customs records for the previous 100 years revealed no cases acquired through this type of contact.

Following his recovery from yellow fever in 1897, Carter was called to Orwood and Taylor (two small towns in upper Mississippi) where he solved the mystery posed by the shipboard outbreaks reported at the Gulf Islands. Carter was assisted in this work by Harry Gant in conducting meticulous observations. After visiting a few yellow fever patients Carter was impressed that the conditions were ideal to study what he called house infection, that is, the time at which people in the house would be taken sick after the introduction of the first case in that house. He noted that the people were reliable and that truthful statements could be expected. Since the communities were remote from a railroad, commercial interests were not involved. They kept daily and hourly records (even to the minute) of the first case in a house, the interval until the next case, and so on. Carter documented the fact that direct personal exposure to the immediate physical surroundings of an index case was not required for people to become infected secondarily. A place itself could not transmit yellow fever. A before-after change in infectivity of a patient's environment observations (such as the following) nailed down Carter's case for an *extrinsic incubation period*.

> * Mr. SWG of Orwood was stricken on August 1, remaining in the household for the duration of his illness. Among eight people visiting him between 6 August and 16 August, there were no cases of yellow fever; among 34 visiting him thereafter, there were 33 cases.
> * Dr. W. became sick with yellow fever on 27 August, succumbing on 1 September. His family of ten were away, not daring to return home until 24 September, whereupon all developed yellow fever within two to three days.

Dr. Carter's words, "The fact that yellow fever is not directly transferable through an environment infected by the patient is due to the fact that the material leaving the patient must undergo some change in the environment before it is capable of infecting another man." He made an analogy to the drying of tuberculous sputum before producing infection of other people or to the tick transmission of Texas Cattle Fever as shown by Theobald Smith. He called this the period of "extrinsic incubation."[1-3]

Carter was transferred to Havana in 1899 to reorganize its quarantine service since yellow fever was rampant. He kept in close touch with Walter Reed and J.W. Lazear through letters and discussions. They were familiar with his Mississippi work from reprints Carter had transmitted. Reed took the cue from Carter's extrinsic incubation findings and suggested that Lazear[2] hold the infected mosquitoes sufficiently long after initial feeding for the causative agent to mature and cause illness when fed on volunteers. Sternberg[2] gave Reed the credit for the idea to incubate the mosquito after its initial feeding.

Although the Reed Commission's success in proving the mosquito (*A. aegypti*) theory originated by Carlos Finlay, Reed communicated directly to Carter on February 26, 1902,

> You, Carter, must not forget that your work in Mississippi did more to impress me with the importance of an intermediate host than everything else put together.

Carter's observations were of immeasurable significance. Once the specific mosquito was identified and its breeding habits clarified, its control was achievable.

The Typhus Fevers

It was Renee Dubos who said

> the epidemiologist has to deal with biological phenomena in all their natural complexity. He must try to recognize the relationships most common in certain ecological situations and to derive from this knowledge the methods of control having the best statistical chance of being useful in each particular situation. . . . the experimenter determines by choice the phenomena that he studies.[4]

These epidemiologic principles are best displayed by a series of fundamental biologic and clinical observations by Nicolle, Brill, Maxcy, and Zinsser.[5-8] Their collective undertakings clarified the ecology, mechanisms of infection, and underlying principles that were necessary to insure control of the rickettsioses, particularly the typhus fevers.

In the wake of Ricketts' incrimination of the tick as vector of Rocky Mountain spotted fever, Charles Nicolle in 1909 identified the human body louse as the vehicle for transmission of epidemic typhus rickettsia. Even though the means of spread of typhus were clarified, the techniques for effective louse control were delayed until 1942 with the advent of DDT.[5]

Meanwhile, Nathan Brill, a New York physician who had taken clinical training in France, began his classic observations. From 1898 to 1910 he studied a large number of febrile patients thought by his contemporaries to have typhoid fever. Brill's bedside ob-

servations coupled with negative findings for blood cultures and Widal reactions convinced him the disorder he reported in 221 patients was neither typhoid nor classic typhus as he had observed during the European experience. Brill stated,

> Inasmuch as these cases have been considered by almost all my colleagues in New York, in the past, as typhoid fever cases, it will be necessary to show the marks of differentiation.
>
> Clinically, this disease resembles typhus fever more than it does any other disease, and I would have felt that I had offered nothing to our nosology if it had been proved that typhus fever had lost its virulence, that it was constantly present in a community, that it was not communicable, that when it was present, epidemics of it did not occur, and that it was no longer a grave and fatal disease. But with typhus fever, as the great masters of medicine have taught, such a conception would be unjustifiable. Therefore, I believe this disease not to be typhus fever.
>
> I should emphatically deprecate calling the disease pseudo-typhoid fever because the affection has nothing in common with typhoid, paratyphoid and typhoid-colon or intermediate group infections. I prefer to speak of it as an acute infectious disease of unknown origin.[6]

From the time of Brill's report, a sporadic typhuslike illness was designated throughout the world and particularly in the southeastern United States as endemic typhus to distinguish it from the more serious classic louse typhus. In the United States, this sporadic illness was called either endemic typhus or (erroneously) Brill's disease. In 1912, Anderson and Goldberger linked Brill's disease with Mexican typhus through studies of the agent in laboratory animals, including cross-immunity tests. Endemic typhus was generally mild to moderate in severity and nonfatal, which distinguished it from classic, severe, louse-borne typhus.

Kenneth Maxcy, an epidemiologist with clinical experience, helped clarify matters by studying cases of endemic typhus in the south and proposed that its agent reservoir was rodents and that an arthropod was its probable vector. After he observed that persons who usually contracted endemic typhus, lived in proximity to granaries, warehouses, and food depots, he concluded in 1926 that "obviously, the rodents upon which suspicion immediately falls are rats and mice, and the parasitic intermediaries which are first suspected are fleas, mites, or possibly ticks."[7]

This unique epidemiologic prediction was confirmed in 1930 by Dyer and associates who trapped rats in Baltimore in the locale of typhus patients. Fleas taken from these rodents and emulsions of rat brains when injected into guinea pigs yielded causative rickettsia. The murine reservoir and flea transmission of a rickettsial agent was established; the clinical illness was noted to be similar to epidemic typhus, milder in its course, and usually nonfatal except in older persons. Epidemic typhus generally was associated with a severe and fatal illness. Rat proofing and rodent control were responsible for a sharp diminution in incidence of murine typhus.

Case records and serum specimens of the index case in Baltimore were transmitted to the National Institutes of Health in Washington by Dr. Louis A.M. Krause. Dr. Krause and Dr. Maurice C. Pincoffs, who examined the patient in consultation, considered typhoid fever as the initial diagnosis but recognized it as endemic typhus when a low titer of Proteus OX19 agglutinins developed.

Two additional patients developed typhus. Rat and fleas taken from the basement of the store where typhus was contracted yielded the causative rickettsia.

> In connection with our epidemiological investigations of cases of typhus, it was found that several cases of endemic typhus had occurred on premises in the immediate vicinity of food handling establishments in Baltimore in the late summer and fall of 1930. On these premises evidence of heavy infestation with rats was observed. Rats were trapped at this place and combed for fleas. A rat nest was also found. Approximately three dozen fleas were secured from the rats and the nest on November 20, 1930.[9]

There was no acknowledgment of the clinical contribution in the publication which recorded the findings.

It was not until the mid-1930s when Zinsser and his associates in Boston and New York further evaluated patients with the Brill-type disease.[8] It was apparent the clinical manifestations were milder than those of the classic type. Several strains of rickettsiae were isolated in guinea pigs with blood from such patients, and in animals, the disease simulated the manifestations of epidemic typhus, including the characteristic histologic findings of vasculitis. Moreover, such convalescent animals were immune to epidemic or murine typhus rickettsial challenge.

An odd finding in patients with Brill's disease was the low or negative titer to Proteus OX19 antigens. It was noted epidemiologically that most patients (95 percent) with Brill's disease gave a history of having contracted classic typhus in countries in Europe in earlier life. Zinsser reasoned correctly that Brill's disease was simply a later recurrence of their illness, milder but nevertheless recurrent epidemic typhus fever. This illness is now called Brill-Zinsser Disease.

A littler later, Murray *et al.* placed lice on patients with Brill's disease and were readily able to isolate the causative rickettsia.[10]

Soon to follow were the findings in Kuala Lumpur, the Walter Reed Army Institute for Research, and Baltimore that patients convalescing from scrub typhus, epidemic typhus, and Rocky

Kenneth F. Maxcy MD, Professor of Epidemiology, The Johns Hopkins University

Mountain spotted fever harbored viable pathogenic rickettsia.[11-13] Isolates of virulent rickettsia were made from resected lymph glands from one to ten years or more after convalescence from the acute attack. These findings simply confirmed the wisdom of Zinsser. Up until this time, it was presumed epidemic typhus rickettsia had no animal reservoir and the ecological cycle was simply man-louse-man, with man serving as the source.

Zinsser's quote at the end of his classic treatise *Rats, Lice and History* is most appropriate at this point. He said,

> Typhus is not dead. It will live on for centuries, and it will continue to break open whenever human stupidity and brutality give it a chance, as most likely they occasionally will. But its freedom of action is being restricted, and more and more it will be confined, like other savage creatures, in the zoological gardens of controlled diseases.[14]

Zinsser was remarkably prophetic, and he never fully believed that man was the sole reservoir of *Rickettsia prowazeki*. In 1975, epidemic typhus rickettsia was isolated from six flying squirrels in Florida and from four in Virginia. Sonenshine and associates[15] identified a widespread natural infection of *R. prowazeki* (the causative agent of epidemic typhus) in the flying squirrel, and the ectoparasites of the squirrel lice and fleas were infected. This strongly suggested that flying squirrel lice and fleas were possible natural vectors. McDade and associates,[16] from 1972 to 1982, identified by serologic techniques the presence of 22 human infections of *R. prowazeki* in the United States; most of the illnesses were identified with contact with flying squirrels. Findings of epidemic typhus in such squirrels and their ectoparasites and antibodies to *R. prowazeki* in squirrels has raised important health questions: the validity of man as the sole reservoir of epidemic typhus is highly suspect.

Mechanisms of Infection and Means of Control

Three classic epidemiologic observations clarified mechanisms of infection and their means of control. Recall that David Bruce first identified *Micrococcus melitensis* on the island of Malta in 1886, *Brucella abortus* was discovered by Bang in 1896, and *Brucella suis* by Jacob Traum in 1914. For a number of years, these three organisms were thought to be separate entities as were the diseases they caused.

In 1918 Alice Evans of the Dairy Division of the Bureau of Animal Husbandry reported that from 192 samples of fresh milk (one herd was from Washington, DC and two herds from Chicago) 45 (23.4 percent) yielded organisms related to *B. abortus* (five dairies were represented). Her second report showed that milk from 17 of 23 cows (73.9 percent) contained *B. abortus*. Also in 1918, she reported the close relationship of *B. abortus* and *M. melitensis* and correctly identified *M. melitensis* as a bacillus and suggested that it be designated as *B. melitensis*. In her discussion, Evans questioned whether human disease might arise from drinking cow's milk contaminated with *B. abortus*. (This remarkable prophecy was fulfilled later.) Likewise, she concluded that the agglutination test performed on human sera could not distinguish infection due to *B. melitensis* or *B. abortus*.[17] Soon, Meyer and Shaw confirmed Evans' work and suggested the genus *Brucella* rather than *Bacteriaceae*.

In 1904 Craig, reporting cases of Malta fever in the US Army, included a nurse who never had been outside the United States.[18] Keefer, while a house officer at Hopkins, reported a case in a laboratory worker with typical undulating fever. Initially thought to be *B. abortus*, the organism was identified ultimately as *B. suis*.[19]

Samuel T. Darling, Graduate, College of Physicians and Surgeons, Baltimore, 1903 (reprinted from Samuel Taylor Darling, G. L. Baum. Library of Congress, Registration no. A-348101,

Samuel Darling was first to report the presence of a microorganism in the tissues of three fatal cases in Panama whose clinical illness resembled disseminated tuberculosis. To him, the organisms demonstrated on smears of tissues resembled *Plasmodia* in histiocytes (macrophages), which prompted him to name the organism *Histoplasma capsulatum*.[20] Ronald Ross, who had seen the malaria parasite in anophelene mosquitoes, visited Panama. On examining the microorganisms visualized by Darling, he remarked that they resembled the protozoans described earlier by Leishman and Donovan[21] in India as the cause of kala azar. Perhaps Darling was swayed in part by the obvious morphologic similarity. For about three decades, this disease was thought to be caused by a protozoa. Henry Meceney[21] was familiar with Darling's work on histoplasmosis in Panama and showed tissue sections containing *H. capsulatum* to Dr. Edna Tompkins,[21] who was studying supravital staining of blood cells at Vanderbilt University at Nashville. Dr. Tompkins and Dr. Katherine Dodd[21] noted Darling's organisms in films of a blood smear of a child suffering from an unusual anemia. Dr. William de Monbreun,[22] familiar with the case, then applied careful mycologic studies in 1933, which identified *H. capsulatum* as a fungus.

During the fourth decade of the twentieth century, many persons were found to have small calcific pulmonary lesions and negative tuberculin tests. Earlier, this strange circumstance had been shown by Charles

Smith and others on the west coast to be a form of coccidiomycosis. A remarkable and key observation was made by Emmonds of the Public Health Services.[22] In his classic publication in 1949, the following dramatic statement was made. "The first isolation of *Histoplasma capsulatum* was made from a mound of soil, at the top of a rat burrow underneath a chicken house." Immediately after this significant finding, the cause became clear to everyone who had noted patients whose illness was contracted from bat caves, belfry towers, chicken houses, and cellars, that subsequently *H. capsulatum* was isolated from soil samples taken from these sites. This is another example of the effective link between epidemiologic observation and biologic confirmation.[21]

Darlings's contributions broadened the field of epidemiology in many ways. Although he did not originate the concept that splenomegaly is an accurate index of the prevalence of malaria in an endemic area, he popularized this simple clinical finding as an accurate indicator, comparable to the blood smear.

In the 1880s, Louis Pasteur and Robert Koch led the golden era of microbiology. Koch wrote the Bible on tuberculosis, and his 1882 paper on the subject is a classic in the history of medical writing.[23] Yet there were several gaps in his findings and interpretations that he was doggedly reluctant to admit. One was his belief that tuberculin was therapeutically effective, yet he withheld from the world the nature of his therapeutic discovery for a considerable period. The tuberculin that he claimed to be therapeutically effective proved to be an extremely valuable public health indicator of infection.

An American physician turned veterinarian, Theobald Smith, contributed importantly to the entire field of microbiology. In 1898, based on his epidemiologic and laboratory findings, Smith insisted that the bovine strain of *Mycobacterium tuberculosis* was different from the human strain.[24] Koch insisted that only the human strain was pathogenic for humans. Smith proved his point (to Koch's displeasure), and it is to be recalled there was a great deal of scrofula and other types of bovine tuberculosis in the United States. These interpretations of Smith led to the means of identification of positive reactors in cows and elimination of this source of infection by sending them to the *abbatoir*. Europeans finally realized the significance of this principle only many years later, which accounted for the continuation of bovine-induced tuberculosis in such major countries as France, Spain, England, and Germany.

The impact on and contributions of epidemiology to medical practice are not limited to the infectious diseases but generously favor all disciplines of medicine. Observation of the patterns of illness and simple measurements in large populations, particularly in underdeveloped countries, have established basic principles of immense value. Simply consider the significance of the finding of a low level of serum albumin or iron (hemoglobin) in persons in less-privileged countries and its importance on the fields of nutrition and/or parasitology. Bailey K. Ashford's effective application of this principle in Puerto Rico culminated in abatement of hookworm infestation.[25]

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

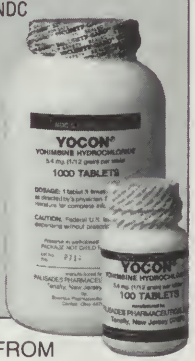
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

One Minute With Diabetes

Improving Blood Glucose Readings

Doctor, I am 60 years old and control my diabetes with diet and exercise fairly well. When I measure my blood glucose the readings range from 150 mg/dL to 220 mg/dL. No matter what I do I cannot bring them down below 120 mg/dL. I am about 25 pounds over my desirable weight. My physician says that I do not need an oral agent for my diabetes, but I would like to do something to improve my blood glucose readings. What are your recommendations?

Your present blood glucose readings are higher than those recommended by the American Diabetes Association as representative of optimal control.

As a first step, you should make an accurate diary of your food intake for a few weeks and then visit a dietitian for a total review of your meal plan. There must be some problem with your present plan. Perhaps your total calories are more than you need for your activity, or the sizes of your servings are not correct.

Learn to read labels when shopping and remember that how well your follow your meal plan depends upon how well your shop. Work with your dietitian for several visits or until you are sure that your meal plan is appropriate and accurate. Usually a weight loss of about 10 pounds will bring your blood glucose readings into the normal range (80 mg/dL to 120 mg/dL before meals and at bedtime).

I agree with your physician that an oral agent is not indicated at this time.

The second step, if there is no medical contraindication, is to establish (and follow consistently) a structured exercise routine, such as walking two miles each day or playing tennis or swimming for an hour. As with meal planning, exercise should be scheduled into the daily program and adhered to strictly.

If after two or three months of structured exercise and good dietary habits, you continue to have elevated blood glucose levels, your physician should consider the use of an oral agent or insulin for the control of hyperglycemia. Persistent hyperglycemia could lead to complications of your diabetes.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Combined Modality Therapy of Esophageal Cancer

There will be approximately 10,000 new cases of esophageal cancer diagnosed in the United States this year, and 9,400 deaths from the disease. The majority of esophageal cancer is histologically squamous cell; however, the incidence of adenocarcinoma of the distal esophagus associated with Barrett's epithelium has been increasing in recent years. The major risk factors for squamous cell carcinoma are the excessive use of tobacco and alcohol, lye stricture, and the Plummer-Vinson syndrome. Despite advances in surgical techniques and radiation therapy, the prognosis for patients with this diagnosis is exceedingly poor. The most recent data published by the American Cancer Society indicates a five-year survival rate of 7 percent for whites and 5 percent for blacks.

The standard "curative" treatment for esophageal cancer that is clinically localized at diagnosis is esophagectomy. All macroscopic disease can be removed in approximately two-thirds of those patients who do go to surgery, and the five-year survival rate for this subgroup ranges from 8 to 22 percent with a median survival time of 12 months. Neither radiation therapy as a single treatment modality nor when added to resection has altered the prognosis. However, preoperative radiation therapy may improve local control and resectability. This poor survival rate is due to early occult dissemination, which is characteristic of the natural history of this disease. Death results not only from the complications of local-regional disease (inanition, aspiration pneumonia) but also from distant metastases present in over 50 percent of patients at autopsy. Thus, the incorporation of systemic therapy into the initial management of esophageal cancer is logical approach to attempt to improve survival outcome. This has been the focus of combined modality investigational trials over the past decade.

Cytotoxic agents with activity in esophageal cancer include cisplatin, bleomycin, the vinca alkaloids vindesine and vinblastine, mitoguazone (MGBG, methyl-GAG), mitomycin, and 5-fluorouracil (5-FU). Combinations of these drugs tested in newly diagnosed patients result in tumor regression (complete and partial responses) in 40 to 60 percent of patients, suggesting potential therapeutic benefit. The sequencing of chemotherapy, surgery, and/or radiation therapy in published combined modality trials has been either

1. chemotherapy alone for 2 or 3 cycles followed by esophagectomy with or without postoperative radiation therapy
2. concurrent chemotherapy and radiation therapy followed by esophagectomy
3. concurrent chemotherapy and radiation therapy without surgical resection

The first approach has been favored by investigators at Memorial Sloan Kettering Cancer Center.[1] Their best results were achieved using cisplatin + bleomycin + vindesine for 2 cycles prior to esophagectomy. A 63 percent partial response rate was observed and the median survival time of those resected was 16.2 months. This was significantly better than a historic control group survival of approximately 9 months. However, a randomized trial comparing this regimen to esophagectomy recently was reported by Roth *et al.* in which no survival differences were observed.[2] Cisplatin + 5-FU and the combination of cisplatin + mitoguazone + vinblastine also have been tested preoperatively without significant improvement in survival rates compared to historic controls. Thus, chemotherapy as a single modality prior to esophagectomy does not appear to impact on survival. Although overall response rates are good, few patients achieve complete clinical or histologic regression of disease.

More promising results, however, have been reported with concurrent chemotherapy and radiation therapy (RT) followed by esophagectomy. Investigators from Wayne State University have explored this approach over the past ten years. Trials of either mitomycin + 5-FU or cisplatin + 5-FU concurrent with 3000 rad, conventional fractionation RT resulted in histologic complete responses in 26 percent of resected patients and a median survival of 18 months. Complete responders had prolonged survival in excess of three years; however, all developed recurrent disease within 30 to 60 months following resection.[3] Both the Southwest Oncology Group and the Radiation Therapy Oncology Group have conducted non-randomized trials of concurrent cisplatin + 5-FU and RT. These studies confirmed that a histologic complete response occurs in approximately 25 percent of patients, although the median survival time of all patient was not improved, ranging between 12 and 14 months. Thus, results of the Wayne State scheduling of chemotherapy and RT suggest improvement in survival for histologic complete responders but no benefit for the study population as a whole.

The University of Michigan recently reported the results of an intensive three week preoperative simultaneous chemotherapy (cisplatin + 5-FU + vinblastine) and RT protocol in 43 patients with local-regional adeno or squamous cell esophageal cancers. Eighty-one percent of patients had an esophageal primary over 5 cm in length, circumferential or obstructing, and 56 percent had enlarged regional nodes on CT scan. Following preoperative treatment, 84 percent were completely resected and 24 percent of patients had no evidence of tumor in the resected esophagus and nodal tissue. At a median follow-up of 32 months, the median survival time of all patients registered in the study has not been reached,

70 percent of completely resected patients and 100 percent of histologic complete responders are alive at 36 months.

The median survival time by histology is 21 months for the squamous cell patients and has not been reached for the adenocarcinoma patients.[4] These data suggest survival benefit for all resected patients (not just histologic complete responders) and a significant improvement in survival compared to historic controls undergoing transhiatal esophagectomy whose median survival was only 12 months. This trial differed from other concurrent chemotherapy and radiation therapy preoperative protocols in the intensity of treatment administered over three weeks rather than the six to eight weeks used for the Wayne State and similar regimens.

Chemotherapy consisted of 5-FU administered continuously for the entire 21-day course of the RT, cisplatin administered by continuous infusion over the first 5 days and last 5 days of RT, and vinblastine. A higher total dose of RT was administered, 4500 rad using BID fractionation. Lastly the transhiatal esophagectomy, a low morbidity and low mortality procedure that does not require thoracotomy, was the surgical procedure of choice. At the University of Michigan a randomized trial is in progress to convincingly determine if survival is prolonged by this therapy compared to esophagectomy.

The third combined mortality approach is the concurrent use of chemotherapy and RT without surgical resection. Infusional 5-FU and RT, 5000 to 6000 rad have been reported for the treatment of both early and late stage esophageal cancer. Clinical complete responses have been observed. Combination chemotherapy regimens of either cisplatin + 5-FU or mitomycin + 5-FU have been reported more recently for patients with early stage disease. Investigators at the Fox Chase Cancer Center have tested this approach since 1980. They report an 87 percent clinical complete response rate determined by barium swallow following infusional chemotherapy with 5-FU + mitomycin concurrent with RT. The median survival time was 24 months with 34 percent of patients alive at 5 years.

While these results appear improved compared to the 12-month median survival generally quoted for esophageal cancer patients, one should note that 40 percent of patients in this trial had primary tumors less than 5 cm in length. The three-year survival of these patients with small primaries was 50 percent compared to 39 percent for tumors greater than 5 cm, and surgical salvage was used for patients who developed a local recurrence but had no evidence of distant metastases.[5] These data suggest that chemotherapy and RT can improve local control and, for patients with early stage disease limited to a small primary, may provide effective, nonsurgical management. However prospective randomized trials comparing surgery vs. RT as the local treatment modality need to be performed before surgery can be bypassed. It is clear from large prospective studies evaluating local control from RT that radiation therapy will provide improvement in dysphagia in approximately 66 percent of patients for 2 or 3 months, while esphagectomy will restore swallowing function.

In summary, most patients are diagnosed with advanced local-regional disease at the time of presentation. Systemic therapies with antitumor activity as well as radio-sensitizing capability (cisplatin and 5-FU) administered concurrently with RT appear most promising for achieving a high histologic complete response rate and survival prolongation. The choice of definitive local treatment, radiation therapy vs. esophagectomy is controversial. Esophagectomy, in particular a transhiatal esophagectomy, remains the local treatment of choice for patients who are good operative risks. Appropriate randomized trials need to be performed before any one treatment approach can be selected as optimal for the primary management of esophageal cancer. At the Johns Hopkins Oncology Center, we recommend an investigational protocol for all newly diagnosed patients with disease confined to the primary $\pm$ regional nodes. This consists of four weeks of continuous infusion cisplatin, 5-FU, and vinblastine chemotherapy and concurrent daily RT (4400r) followed by transhiatal esophagectomy.

Medical Heritage - Doctors' Day - March 30

Our Maryland Auxiliary has taken a special interest in Medical Heritage and Doctors' Day over the past few years, and our recognition, entertainment, and historical remembrance of our physicians frequently have put us in the limelight at Southern Medical Association Conventions where our activities have been displayed and honored. The memorable display on Dr. Archer of Harford County assembled by Diane Sitaris and augmented by mementos (supplied by Med Chi's Librarian Joseph Jensen) won us an inscription on the Feldner Trophy, the first time our Maryland exhibits were so honored. We received an award for best state exhibit with our display of women physicians in Maryland and on Med Chi that stressed the early women in Maryland medical schools and presented the fascinating career of Dr. Zoraida Lee-Llacer, a foreign-born woman physician, her practice and life in Maryland.

This year our project of postal plates for Doctors' Day was initiated as a Southern Medical Association seventeen-state project for the entire Auxiliary membership. Instead of receiving a specific award, our project was enthusiastically endorsed as a special Doctors' Day project to be implemented throughout the South and available to all counties. This endorsement is a truly great honor; rarely do the individual state projects attain a total Auxiliary stature.

The project that has achieved such prominence is centered on physician recognition through a postal plate inscribed "Doctors' Day - March 30th" with a carnation. It is designed to be used throughout the month of March on all mailings of the recipient and prints in red, which is very effective. The postal plate was first given to Med Chi for use on their March mailings, to Dean Ross of Johns Hopkins School of Medicine, and to Dean Dennis of University of Maryland Medical Systems. After initiating the program at this level through the state program, a pilot project was tried at the county level. Howard County General Hospital President Donald Jacobs was asked if he would accept an auxiliary gift of a Doctors' Day postal plate for his hospital's March mailing; the gift was duly accepted and used. At that point the venture was opened to all Auxiliary counties, and plates were ordered for hospitals from Cumberland, Allegany County, to Harford and points south. The plates, ordered through Pitney-Bowes and International Mailing Systems, have been a successful and unique way of recognizing our doctors during their special month.

When the project was first discussed with now president of Southern Auxiliary, Janet Campbell, she asked that a comprehensive presentation of the plate, the procedure, design, use, etc., be given to her new Board during the convention in DC this past November. With the assistance of the Graphics Department of

Med Chi, an explanatory poster was created that clearly demonstrated what the postal plate actually was, how it was designed, and how it would be used. Their flier carried sample letters used in setting up the project, an enlargement of the art work, and a sample of how the meter ad looked on the envelope.

Other Maryland members of the Southern Board who assisted with the presentation (Helen Boyer, Betty Molz, Mary Skipton, and Ching Barretto) were very helpful in seeing that all went smoothly, and the Southern Board was quite impressed by our project.

Information has been dispensed to all the Southern States, and Pitney-Bowes has established a central 800 number that will facilitate ordering. The project need not be limited to Auxiliary but can be used by others who would like to honor their physicians in this way. Information is available at our Auxiliary Office or through Mildred Taylor, Maryland Councilor to Southern. Thanks to her three years on the Med Chi Public Relations Committee and the suggestion of Dr. Maganzini two years ago, the Doctors' Day Postal Plate has become a reality and a true success story for Maryland.

Maryland Medical Journal Readers' Survey

The *Maryland Medical Journal* is your publication, an important communication tool to convey scientfic and practice information. Please take a moment to let us know what you'd like to read in *MMJ* by completing this brief survey.

1. How often do you read *Maryland Medical Journal?*

_____ Always (several articles each issue) _____ Sometimes (three or four articles a year)
_____ Seldom (skim occasionally) _____ Never

1A. If you answered "never" to question 1, which of the following best describes your reason for not reading *Maryland Medical Journal*?

_____ I rarely find articles of interest _____ I have too many other journals to read
_____ I don't have time to read it Other _____

2. How many other people read your copy of *MMJ*?

_____ 0 _____ 4-6 _____ 10 or more
_____ 1-3 _____ 7-10

3. Which of these topics would you like to see discussed in *MMJ*?

_____ More scientific articles _____ Federal legislation
_____ More socioeconomic articles _____ Money management
_____ Insurance coverage and rates _____ The future of medicine: what to expect in the 1990's
_____ PR activities for physicians _____ Professional growth for medical society leadership
_____ Insurance payment problems _____ Meetings, how to plan them, where to have them
_____ Continuing medical education Other _____
_____ Maryland legislation

4. Do you think 12 issues per year of *MMJ* are:

_____ The right number ___ Too many _____ Not enough

5. The quality of the articles appearing in *MMJ* is:

_____ Consistently high ___ Variable _____ Mediocre ___ Consistently low

6. I most often read: (check as many as apply)

_____ Scientific articles _____ The Executive Director's newsletter _____ Doctor's Note
_____ Classified ads _____ The DHMH newsletter
_____ Board of Physician Quality Assurance Actions
_____ A regular department (i.e., One Minute With Diabetes, Library Page, etc.)
Other _____

7. The articles that have appeared in *MMJ* have contributed to my professional knowledge and growth.

_____ Greatly _____ Somewhat _____ Little

8. The number of pages in *MMJ* is:

_____ Too great _____ Too few _____ About right

9. I would like to see *MMJ*: (check as many as apply)

_____ Remain about the same _____ Increase its size; carry more articles
_____ Decrease its size;carry fewer articles _____ Increase the ratio of ads to text
_____ Decrease the ratio of ads to text

10. Have you ever submitted an article or commentary to *Maryland Medical Journal* for publication?

_____ Yes _____ No

10A. If "No", why not?

11. How would you rate *Maryland Medical Journal* on:

	excellent	good	fair	poor	no opinion
Appearance	_____	_____	_____	_____	_____
Content	_____	_____	_____	_____	_____
Length	_____	_____	_____	_____	_____
Accuracy	_____	_____	_____	_____	_____
Interest	_____	_____	_____	_____	_____
Ease of reading	_____	_____	_____	_____	_____
Usefulness	_____	_____	_____	_____	_____

12. What do you like least about *Maryland Medical Journal*? (please print)

13. What do like most about *Maryland Medical Journal*? (please print)

14. How often do you use the advertisers who appear in *MMJ*?

_____ Often
_____ On occasion
_____ Seldom
Never (If "never" why not?) _____

15. This survey *is* anonymous, but we would appreciate the following information:

A. Your age group:

_____ 30 or under _____ 41-50 _____ 61-70 group
_____ 31-40 _____ 51-60 _____ over 70

B. Your primary specialty: _____

C. Work situation:

_____ solo practice _____ group _____ partnership
_____ full time faculty _____ government
other _____

Optional: Please call me, I have more to say. (Please print your name and number below)

Thank you for your help. Please fold, staple and return this survey to:

NO POSTAGE NECESSARY IF MAILED IN THE UNITED STATES

A Comment on the Doctor and Hospital Responsibility

Traditionally, the duty of the hospital to the patient has been confined to providing a satisfactory place in which the physician could furnish care. The doctor and the patient formed an independent unit, and the physician was solely responsible for therapy. The hospital was not accountable for the negligence of the doctor in the absence of agency or other factors to which the doctrine of respondeat superior could be applied.

This concept has been changed radically by legal opinion. The lawyer for the appellee and the courts now also focus on the errors of the hospital board and the medical staff with reference to the physician being sued. A review of the credentialing and monitoring process may yield evidence indicating negligence of the medical staff and of the managing board by lack of supervision.

The corporate structure is expected to see that quality care is provided to its patients so that they can reasonably look for a satisfactory result from their hospital stay. Not only must the board appoint competent individuals to its medical staff but also it must monitor the care they give. The link between the individual practitioner and the board is the medical staff.

All the states and the Joint Commission on Accreditation of Hospitals Organization have mandated that every hospital must have an organized medical staff. Members of the staff, through action of its credentialing committee, are authorized by the corporation to recommend or deny approval for applications for staff appointments. Further, they should carefully delineate initial clinical privileges. Every physician must expect to have his/her competence monitored during the term of appointment and if changes are deemed necessary they should be recommended by the staff. The governing board, after weighing the thoughts of the staff, may or may not adopt them. The reasons for rejections, at any stage, however, must be identified and noted in writing. This caveat is most important if the rejected physician protests and wishes to go through the due process of appeal. Dissension between medical staff and governing body most often arises from lack of proper communication and a failure of each unit to appreciate the duties and responsibilities of the other. Each group is necessary to provide quality care in the operation of the hospital.

The legal status of the medical staff, the all-important link between the physician and the managing board, has been clearly defined by the American Medical Association.[1] Professionally independent in medical judgment, the staff is not autonomous in administrative relations with the hospital. An organized medical staff is a legally separate entity, however, representing the collective professional responsibility of its individual members in the administration of medical care in the hospital. In other language, the staff is a separate part of the hospital but only to the extent that part is a portion of the whole with defined intramural relationships and reciprocal obligations.

Willett,[2] Legal Counsel to the California Medical Association, cited some interesting legal opinions about the medical staff, which may be considered to be an unincorporated association organized under the auspices of the Board of Directors. Membership on the staff, however, does not mean personal liability if the staff is sued. Staff duty is to the governing body and not to the public, which looks upon the Hospital and not the Medical Staff as the responsible agent. Indeed, California courts consistently have held that staff members are not liable for the unlawful acts of other members without their participation, knowledge, or approval. Willett offered a warning that staff members may be held liable for anticompetitive conduct in which they participate, however, whether or not the medical staff is treated as a medical entity.

Within this context, the relationship of the individual physician to the governing body becomes clear. Both sides are interested in the same objective: providing excellent care. The following legal cases have been selected to highlight details of this association.

Corporate responsibility had its genesis in *Darling v. Charleston Community Memorial Hospital*[3] when the Supreme Court of Illinois maintained that the corporation was obligated to its patients to see that quality care was provided. In the immediate instance, the hospital was negligent in failing to observe that the proper committee did not review the work of the involved doctor and to require that he obtain a consultation to achieve the desired outcome. The hospital was also delinquent in neglecting through its nursing staff to supervise the clinical course of the patient.

The decision in *Darling* firmly bound hospital and physician through the medical staff to the care of the patient. Lack of supervision was apparent in the activities of the medical staff (medical) and the hospital board (administrative).

Poor oversight by the surgical staff (for which the hospital was ultimately answerable) existed in *Purcell v. Zimbleman*[4] in which a poor result followed the performance of an inappropriately selected operation. Previous similar unsatisfactory results of the physician had been reviewed in the department of surgery, but discussion, counseling, or restriction of the operative activities of the surgeon did not result. The Courts found for the patient because the hospital was negligent in not seeing that the therapy of the accused physician was monitored and some corrective action taken.

Failure to verify the answers of a physician in his application for privileges led to difficulty in *Johnson v.*

Misericordia Community Hospital.[5] The replies were false, and if the truth had been known, the physician would have been denied privileges. The surgeon was subsequently accused of performing a procedure not in accord with good orthopedic practice. Undisputed expert testimony established that the doctor was in error. The hospital was also found to be negligent. The Court declared that even although the governing body may rely on the medical staff and its credentials committee in consideration of the qualifications of an applicant, delegation of responsibility to investigate and evaluate professional competence for clinical privileges does not relieve the hospital board of its duty to its patients to appoint only qualified doctors to the medical staff and to monitor and review competence in a periodic manner. The Court was forthright in its condemnation of the hospital inasmuch as it had clearly violated the fundamentals of the credentialing process. In addition, the hospital did not have a functional medical staff.

In review, the Courts have stated unequivocally that:

1. A hospital shall have a system to evaluate applicants for membership on its medical staff.
2. It shall use criteria such as character, competence, and training in the selection process.
3. The standard required for admission shall be defined and clearly stated.

The possession of a license to practice and of privileges in other hospitals, if any, must be verified. Letters of recommendation should be factual to assure the presence of competence. The applicant should have malpractice insurance and report if he/she has had previous difficulty involving litigation.

In summary, the practitioner, through the medical staff and the board of directors, have a common interest to provide quality care for the patient. Lacking medical qualifications, the board must authorize the performance of professional care by the medical staff, and then monitor the work of the individual physician through the staff that oversees medical activities. Professional independence is a mainstay of the medical staff but the lay board must be knowledgeable of the activities of the physicians to be certain they are and remain competent and are conducting themselves in a manner that will promise quality care to the patient.

Med Chi and Medical Mutual Offer 5 Percent Premium Discount for Physicians

On January 5, 1989, Med Chi and the Medical Mutual Liability Insurance Society of Maryland announced their sponsorship of "Effective Communications: A Risk Management Strategy," a workshop designed to teach physicians how improved communications skills can enhance quality of care and reduce the risk of medical malpractice claims.

Med Chi President, Raymond M. Atkins MD, said, "This workshop will provide a valuable service to our physicians and is a way that Med Chi can meet the needs of its membership."

Chairman of the Board and Chief Executive Officer for Medical Mutual, Raymond M. Yow MD, said, "Because communication plays an important role in professional liability, Medical Mutual will offer a 5 percent premium discount on 1991 medical professional liability renewal policies to all our members who successfully complete this workshop in 1990."

"Many studies have suggested that the medical community needs to improve its communication skills," said Dr. Yow, "and achieving this objective could offer significant improvement to the medical liability problem." Dr. Yow added that this workshop will influence medicine in a positive way as it will reduce insurance costs for physicians.

The workshop, provided by Communications Systems, Inc., will teach physicians the value of effective physician-patient communications and its link to risk management. The workshop, which fulfills 3 Category I CME credits, will include group discussions, exercises, and practical tips for improving communications.

Physicians who are unable to attend the workshop may complete *Risk Prevention Skills*, a self-study course by Dan J. Tennenhouse MD, JD, FCLM, and Mary P. Kasher RN, MS, JD The self-study course points out common physician-patient communication and record-keeping errors through clinical examples and offers advice on responding to each situation. The course includes computer-scored test questions and is approved for 6 credit hours in Category I of the Physician's Recognition Award of the American Medical Association by Extended Programs in Medical Education of the University of California School of Medicine in San Francisco.

Dr. Atkins and Dr. Yow announce 5 Percent Premium Discount. (Seated left to right) Raymond M. Atkins MD, Med Chi President; Raymond M. Yow MD, CEO Medical Mutual, David A. Murray, Medical Mutual President.

For workshop dates and registration information, please see the form on the following page.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

In the Matter of Edward R. Burka MD Before the Maryland Board of Physician Quality Assurance

Final Decision

On June 26, 1989 the Board of Physician Quality Assurance (the Board) issued charges against Edward R. Burka MD (Respondent) pursuant to Health Occupations Article, *Annotated Code of Maryland* (HO) §14-504(b). Specifically the Board charged as follows:

> Subject to the Administrative Procedure Act, the Board shall order the suspension of a licensee if the licensee is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside. (HO §14-504(b)(1))
> After completion of the appellate process if the conviction has not been reversed or the plea has not been set aside with respect to a crime involving moral turpitude, the Board shall order the revocation of a license subject to the hearing provisions of 14-505 of this subtitle. (HO §14-504(b)(2))

The charges were a result of Respondent's plea of guilty in *United States v. Edward R. Burka*, United States District Court for the District of Pennsylvania.[1]

The charging document provided Respondent with notice of the statutory basis of the charges, the alleged factual basis supporting the charges, the time, place, and nature of the hearing. Respondent was also notified that HO §14-505(d) provided

> If after due notice the individual against whom the action is contemplated fails or refuses to appear, nevertheless the hearing officer may hear and refer the matter to the Board for disposition.

and the COMAR 10.01.03.25(b) provided that

> The hearing examiner may, with consent of the parties, conduct all or part of the hearing by telephone, television, or other electronic means, if each participant in the hearing has an opportunity to participate in, to hear, and, except when telephone is used, to see the entire proceeding while it is taking place.

The hearing was scheduled on August 14, 1989. Respondent did not appear. The case proceeded before a Hearing Officer with Administrative Prosecutor, Debra G. Woodruff, Assistant Attorney General, representing the State. The State introduced the following exhibits:

State Exhibit No. 1 - Package of documents mailed to the Respondent under certified mail number P-546912984. The document consisted of a three (3) page letter of procedure dated June 26, 1989 addressed to the Respondent; a Summons and Notice of Hearing two (2) pages in length, a Charging Document four (4) pages in length, with attached Exhibits A through C.
Exhibit A - the Judgment in Criminal Case 88-00228-1, *United States of America v. Edward R. Burka*, consisting of two (2) pages, dated January 24, 1988.
Exhibit B - Plea Agreement in *United States of America v. Edward R. Burka*, Criminal Case 88-00228-1 consisting of ten (10) pages, dated December 7, 1988.
Exhibit C - Consent Motion of Dismissal in *In re the Matter of Edward R. Burka*, U.S. Court of Appeals for the Third Circuit, No. 88-1432, consisting of three (3) pages, dated December 7, 1989.
State Exhibit No. 2 - Certified mail receipt showing receipt at Eglin Air Force Base dated June 28, 1989 by Sandra Glorig.
State Exhibit No. 3 - Copy of a telefaxed transmittal showing receipt by the Respondent of the package from prison authorities on June 28, 1989.

By letter dated August 16, 1989, the Hearing Officer issued to Respondent and the State a proposed decision which included proposed findings of fact, proposed conclusions of law, and a recommended sanction. The parties were advised of their right to file exceptions to the proposed decision. On October 11, 1989, the Chief Investigator for the Board spoke with Respondent and ascertained that Respondent had received the Hearing Officer's proposed decision. Neither Respondent nor the State filed exceptions to the Hearing Officer's proposed decision. The Board considered the Hearing Officer's proposed decision at its meeting on Wednesday, November 8, 1989. By a majority vote of its full authorized membership the Board issues the following Final Order and Decision.

Findings of Fact

Based on clear and convincing evidence the Board finds as follows:

1. At all times relevant to these charges, the Respondent was and is licensed to practice medicine in Maryland.

2. Respondent pleaded guilty to unlawful possession of controlled substances, Dilaudid tablets, with intent to distribute and dispense outside the course of accepted professional medical practice and for no legitimate medical purpose in violation of 21 U.S.C. §841(a)(1); furnishing false information in a required record in violation of 21 U.S.C. §843(a)(4)(A); and obstruction of an agency proceeding in violation of 18 U.S.C. §1505 in *United States v. Edward R. Burka*, the United States District Court for the Eastern District of Pennsylvania.

3. Respondent was sentenced by the Court of the offenses set forth in Paragraph 2 on January 24, 1989.[2]

1. The plea of guilty provided that Respondent agreed to surrender permanently his license to practice medicine in every state in which he had a license. HO §14-504(a) provides that licensed physician may not surrender the license while the licensee is under investigation or while charges are pending against the licensee. HO §14-504(b) provides that the Board may set conditions on its agreement with the physician under investigation or against whom charges are pending to accept surrender of the license. The Board did not accept the surrender of Respondent's license. The Board decided to proceed against Respondent's license.

4. The crime involved in violation of 21 U.S.C. §841(a)(1) is a crime involving moral turpitude.

5. The crime involved in violation of 21 U.S.C. §843(a)(4)(A) is a crime involving moral turpitude.

6. The crime involved in violation of 18 U.S.C. §1505 is a crime involving moral turpitude.

7. All opportunities for appeal have lapsed since Respondent, as part of his plea negotiated with the United States Government, forfeited all appellate rights.

8. There is no evidence upon which the Respondent might rationally seek extraordinary relief from his conviction.

Conclusion of Law

Based on clear and convincing evidence and the findings of fact, by a majority vote of its full authorized membership the Board concludes that Respondent was convicted and pleaded guilty with respect to a crime involving moral turpitude in violation of HO §14-504(b).

Order

Based on the findings of fact, conclusion of law, on this 21st day of November 1989 it is hereby

ORDERED that Respondent's license to practice medicine is REVOKED; and it is further hereby

ORDERED that Respondent IMMEDIATELY must return his license certificate to the Board; and be it further

ORDERED that this is a Final Order and Decision.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

■ ■ ■

In the Matter of
Michael F. Corner
Physician Assistant
Before the
Maryland Board of
Physician Quality Assurance

Order of Summary Suspension of Certification to Practice as a Physician Assistant

The State Board of Physician Quality Assurance (the Board) herein sets forth the following background information as pertinent to this Order for Summary Suspension (the Emergency Suspension) with regard to the certification of Michael F. Corner to practice as a physician assistant.

1. Respondent was and is presently certified to practice as a physician assistant in the State of Maryland.

2. On or about March 22, 1989 Subject A* reported an act of alleged sexual abuse involving Respondent and her 9-year-old daughter, Subject B, to the State of Maryland Department of Social Services (DSS). DSS then referred the matter to the Baltimore City State's Attorney's Office (SAO).

3. On or about August 17, 1989 representatives of the SAO Sex Offense Unit interviewed Subject B, who stated that Respondent, whom Subject B identified as Subject A's boyfriend, on several occasions between January 1988 and June 1989, entered her bedroom and placed his hands between her legs on what Subject B referred to as her "private part" (denoting vagina).

4. On or about September 14, 1989 detectives of the Baltimore City Police Department interviewed Respondent in relation to these allegations. Respondent, after being advised of his Fifth Amendment rights against self-incrimination and, after agreeing to waive those rights, admitted to nonconsensual, involuntary sexual contact with Subject B and further admitted another instance of involuntary sexual contact with another young female while living in Indiana in 1974.

5. After the conclusion of this statement, Respondent was placed under arrest by detectives of the Baltimore City Police Department. Respondent was then indicted by the Grand Jury for Baltimore City on September 8, 1989 under indictment number 18827102 for the charge of third-degree sexual offense (see *Annotated Code of Maryland*, Art. 27 §461 and §464 B). Said charges are scheduled for trial in Baltimore City Circuit Court on December 12, 1989, Part 2.

Findings of Fact

Based on the background information set forth above and the exhibits hereto, the Board has reason to believe that the following facts are true:

1. Respondent was and is presently certified to practice as a physician assistant in the State of Maryland.

2. On or about May/June 1986, Respondent was employed as a physician assistant by the Mt. Royal Medical Center, Baltimore, Maryland. At that time, Respondent, in his capacity as a physician assistant, treated Subject A, a patient who sought medical attention at the Center.

3. Thereafter, Subject A sought employment as a secretary at a Mt. Royal Medical Center branch facility, the Northwest Medical Center, Baltimore, Maryland. Respondent then transferred his place of employment to this facility, and then became involved in a continuing personal relationship with Subject A.

2. The Board *sua sponte* takes notice that there is no docket entry from the Court indicating the date the Plea Agreement was entered and Respondent convicted. However, the Judgment of the Court dated January 24, 1989 indicates Respondent pled guilty and was convicted of the stated offenses.

*Subject names are not used in the Summary Suspension. The Board maintains a list of subject names which corresponds to the alphabetical letter used in the Summary Suspension. This list is available to Respondent upon request.

4. During the course of this personal relationship, Respondent cohabitated with Subject A and her children, among whom was her 9-year-old daughter, Subject B.

5. On September 14, 1989, Respondent was interviewed by Detective Joan McEntyre of the Baltimore City Police Department in which Respondent, after being advised of his Fifth Amendment rights against self-incrimination, and after agreeing to waive those rights, admitted the following:

(a) That during an 18-month period (from early 1988 until the time of the statement), Respondent, while cohabitating with Subject A and her family, on 8-10 occasions engaged in nonconsensual, involuntary sexual conduct with 9-year-old Subject B;

(b) That the conduct occurred primarily in Subject B's bedroom when Respondent perceived Subject B to be asleep;

(c) Respondent's contact consisted of "rubbing her back or stomach or something of that nature and also mak[ing] genital contact with my hand...";

(d) That Respondent answered affirmatively when asked if he, Respondent, had fondled Subject B's vagina;

(e) That Respondent engaged in similar nonconsensual, involuntary sexual conduct with another woman friend's daughter, while living in Indiana in 1974.

6. In his practice as a physician assistant, Respondent is certified to perform delegated medical acts under the supervision of a physician. These acts consist, but are not limited to, screening patients, performing physical examinations, performing developmental screening examinations on children, collecting specimens for laboratory tests and performing clinical procedures involving close physical contact with patients. Respondent, in admitting to engaging in involuntary and nonconsensual sexual contact with at least two young females, poses a grave risk and imminent danger to the public health, safety, and welfare of the citizens of Maryland in that in his capacity as a physician assistant Respondent maintains the opportunity, through the delegated acts which he is authorized to perform, to come into unsupervised, intimate physical with both children and adults.

Conclusions of Law

Based on the foregoing facts, the Board concludes that the public health, safety, and welfare imperatively requires emergency action in this case pursuant to State Government Article §10-405(b), *Annotated Code of Maryland*.

Order

It is this 29th day of November 1989 by the State Board of Physician Quality Assurance:

ORDERED that pursuant to the authority vested in the Board by the State Government Article, §10-405 of the *Annotated Code of Maryland*, Respondent's State certification to practice as a physician assistant in the State of Maryland be and hereby is SUMMARILY SUSPENDED, and be it further

ORDERED that if a hearing is requested to consider this SUMMARY SUSPENSION, it shall be held before the Board at its next regularly scheduled meeting, Wednesday, December 13, 1989.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

In the Matter of Waheeda S. Qaiyumi MD Before the Maryland Board of Physician Quality Assurance

Final Decision Summary of Evidence, Findings of Fact, Conclusions of Law

On November 14, 1989 the Maryland Board of Physician Quality Assurance (the Board) charged Waheeda S. Qaiyumi MD (Respondent), pursuant to HO §14-504, Health Occupations Article of the Annotated Code of Maryland (HO). Respondent was charged as follows:

> Is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; HO §14-504(6)[1]
> Is ... convicted ... by a court of any state or country for an act that would be grounds for disciplinary action under this section; [HO §14-504(22)]

Grounds for disciplinary action under this section are:

> Is guilty of immoral or unprofessional conduct in the practice of medicine; [HO §14-504(3)]

1. The 1988 General Assembly, by Senate Bill No. 508 and House Bill 855, merged the functions of the Commission on Medical Discipline and the Board of Medical Examiners into the Board of Physician Quality Assurance. The General Assembly also amended Health Occupations Article, §14-504 by repealing HO §14-504(6) and enacting HO §214-504(b). Section 14-504(b) *requires* the Board to suspend a license if the licensee is convicted of or pleads guilty or *nolo contendere* to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside. In addition, after the completion of the appellate process if the conviction has not been reversed or the plea has not been set aside with respect to a crime of moral turpitude, the Board *shall order* the revocation of a license. Under this repeal and amendment, the grounds for discipline set forth in HO §14-504(6) remain the same, but the Board's discretion as to sanction is removed. Because the conviction or plea herein occurred prior to the effective date of the Act, the charge is issued under former HO §14-504(6), giving the Board discretion as to any sanction.

Willfully makes or files a false report or record in the practice of medicine; [HO §14-504(12) of the Act]
Willfully submits false statements to collect fees for which services are not provided; [HO §14-504(25) of the Act[2]];

A hearing was scheduled before a Hearing Officer pursuant to HO §14-505 and commenced on February 9, 1989. Prior to the hearing, the State withdrew the charge of HO §14-504(22) and the grounds for discipline under that section, i.e, HO §14-504(3), (12), and (25). Consequently, the hearing was only on the charge of HO §14-504(6). Present at the hearing were the Hearing Officer; Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor for the Board; Louis A. Becker, Esquire, and William Cookson, Esquire, Attorneys for the Respondent; Respondent; Respondent's witnesses and the Court Stenographer. Mr. Becker moved for the dismissal of the charge of Ho §14-504(6) on the basis that the Criminal court had, by its entering probation before judgment in the Respondent's criminal case, *de facto*, overturned Respondent's plea of guilty. Respondent argued that if the plea of guilty was overturned then Respondent would be entitled to the benefits provided such a Respondent under HO §14-509 of the Maryland Medical Practice Act. The Administrative Prosecutor moved for a continuance to brief the issue. A continuance was granted until March 7, 1989 at 9 a.m., at which time the same persons reconvened at the same place except that the Court Stenographer was unavailable because of weather conditions. A sound recording was made of the proceedings and was preserved. The Hearing Officer denied Respondent's Motion to Dismiss. The hearing was held.

Summary of Evidence

Admitted into evidence by the State without objection by the Respondent were State Exhibits 1-7.

No witnesses testified on behalf of the State.

Admitted into evidence by Respondent without objection by the Administrative Prosecutor were Respondents' Exhibits 1-39.

Respondent's Exhibit 37, copies of eighteen (18) Medicaid fraud cases disposed of by the Commission on Medical Discipline was rejected by the Hearing Officer upon objection by the Administrative Prosecutor to their relevance to the present proceeding.

On March 15, 1989 the Hearing Officer submitted proposed Findings of Fact, Conclusions of Law and Recommendation ("Recommended Decision") to Respondent and the State. Pursuant to State Government Article, §10-212, the parties were advised of their rights to file exceptions and make oral argument on the exceptions to the Board.

On April 7, 1989 the State filed exceptions to the Recommended Decision. On August 9, 1989 Respondent filed exceptions to the Proposed Decision and a Response to the State's exceptions. An exceptions hearing was scheduled before the Board on Wednesday, August 16, 1989. Respondent and her husband were present as were her attorneys. The State was represented by Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor.

Respondent, without objection from the State, presented to the Board the following documents, which were accepted as part of the record:

Respondent Hearing Exception Exhibit 1 - Letter from Stanley R. Platman MD, chair, the Medical and Chirurgical Faculty Physician Rehabilitation Committee, To Whom It May Concern.
Respondent Hearing Exception Exhibit 2 - Letter from Alix C. Rey MD to Edward J. Kitlowski MD, Chair of the Committee.
Respondent Hearing Exception Exhibit 3 - Transcript of the June 24, 1988 Sentencing Hearing in *State of Maryland v. Waheeda S. Qaiyumi*.
Respondent Hearing Exception Exhibit 4 - Transcript of the July 20, 1988 hearing of Defendant's Motion to Revise Judgment in *State of Maryland v. Waheeda S. Qaiyumi*. (This exhibit was also marked Respondent's Exhibit 43 but not included in the Hearing Officer's list of exhibits. The Hearing Officer has no record of this being introduced in the hearing).

The State introduced page 10 of its exceptions that inadvertently had been deleted from the Board's agenda package. The Board considered the Proposed Decision, the parties' exceptions, the Respondent's exception exhibits, and the parties' oral argument.

A quorum of the Board considered the parties' exceptions and heard oral argument. A majority of the full authorized membership voted to adopt a proposed order.

On September 11, 1989 the Board forwarded its proposed decision to the State and Respondent. The Board offered the parties another opportunity to file exceptions since some of the Board's proposed findings differed from the Hearing Officer's and the Board's proposed sanction was harsher than the one to which the parties had previously excepted.

On September 22, 1989 Respondent filed exceptions with the Board. The State filed no exceptions. Argument was held and scheduled before the Board on Wednesday, October 25, 1989.

Findings of Fact

Based on the testimony and the exhibits introduced at the hearing before the Hearing Officer, all the filed exceptions, the exceptions hearing exhibits and both oral arguments, the Board, by a majority of the full authorized Board hearing this case and by clear and convincing evidence, finds that:

Finding of Fact I. Respondent *pleaded guilty* to a crime of moral turpitude. Medicaid fraud is a crime of moral turpitude and Respondent's plea of guilty was not overturned at any stage of an appeal or postconviction proceedings.

2. These charges are cited under the Act prior to amendment. The present parallel cites are HO §14-506(22) = HO §14-504(a)(21); HO §14-504(3) = HO §14-504(a)(3); HO §14-504(12) = HO §14-504(a)(11) and HO §14-504(25) = HO §14-504(a)(24).

Finding of Fact II. The Respondent did, in fact, plead guilty to Medicaid fraud as demonstrated by State Exhibits 1 through 6 provided to the Hearing Officer, without objection by the Respondent, during the hearing and provided to the Board herewith. A criminal information was filed against the Respondent on June 23, 1988. The Respondent entered into a Plea Agreement and the case was heard on June 24, 1988. No evidence to the contrary having been presented, the record is more than sufficient by clear and convincing evidence, that the Respondent did plead guilty to Medicaid fraud, a crime of moral turpitude as alleged in the Board's Charging Document.

Facts as to the Board's Sanction

These facts support the Board's Conclusion of Law.

Finding of Fact III. The charges to which Respondent pled guilty were:

> ... from on or about January 1, 1985 through on or about December 31, 1987, did knowingly and willfully make and cause to be made a series of false statements and false representations of material fact in applications for payment submitted to the Medical Assistance Program ... in that WAHEEDA S. QAIYUMI knowingly submitted applications requesting payment for services which were not performed .... (*See* State Exhibit 1*).*

Finding of Fact IV. Respondent was sentenced to one year incarceration, all but 21 days suspended, a fine of $10,000 and to pay restitution to Blue Cross/Blue Shield in the amount of $9,500 as well as $77,540.50 to the Department of Health and Mental Hygiene Medical Assistance Program.

Finding of Fact V. Respondent was at all times relevant a Medicaid physician provider with offices located at 9650 Santiago Rd., Suite 110, Columbia, MD 21045. She specializes in providing pediatric services to persons, including Medicaid recipients, living in Columbia, Maryland area.

Finding of Fact VI. The Maryland Medical Assistance Program is a State plan established pursuant to Title XIX of the Social Security Act of 1939 and is commonly referred to as "Medicaid." Its purpose is, among other things, to provide physicians and pediatric services for indigent Maryland citizens.

The Medicaid Program in Maryland is administered by the Department of Health and Mental Hygiene located at 300 West Preston St. in the City of Baltimore, Maryland.

Medicaid providers are required to submit accurate invoices for the services they to Medicare recipients to the Department of Health and Mental Hygiene of Baltimore City. The Department relies on the information contained in the invoices in determining the correct amount of benefits to be paid to the Medicaid provider. For each invoice submitted, the provider certifies that the billed service was medically necessary and was provided to the recipient.

Finding of Fact VII. From January 1, 1985 through and including December 31, 1987, the Respondent submitted applications for Medicaid benefits to the Department of Health and Mental Hygiene in Baltimore City, for an undetermined amount of throat cultures allegedly performed for Medicaid recipients. The Defendant personally prepared and signed each invoice submitted to the Department of Health and Mental Hygiene certifying that the throat culture was medically necessary and was provided to the Medicaid recipient.

Finding of Fact VIII. During that same time period, the Respondent billed Blue Cross and Blue Shield as primary insurer or as Medicare intermediary for an undetermined amount of throat cultures.

Finding of Fact IX. Respondent confessed that she had billed Medicaid Assistance for cultures that were not in fact performed.

Finding of Fact X. Respondent admitted that some unperformed throat cultures should have not been billed to Medical Assistance.

Finding of Fact XI. Respondent overbilled Medical Assistance for urine cultures. Respondent billed Medical Assistance for urine cultures totalling ten thousand, nine hundred ninety-one dollars and fifty cents during the period January 1, 1985 through December 31, 1987.

Finding of Fact XII. The records produced by Respondent for the years in question for Medical Assistance patients contained false statements that she had performed throat cultures that were returned negative.

Finding of Fact XIII. The Respondent is of Indian extraction and is quiet, introverted, and submissive. She practices in the environs of Columbia, MD. Respondent and Dr. Chowdhry testified that practitioners in that location reject Medicaid and Medicare patients. The Respondent has regularly accepted them and members of various ethnic groups who are more comfortable with her than with other physicians. Some of the patients had no insurance and no money. Others had Medicaid and Medicare, but because of the Respondent's own unfamiliarity with the paperwork required, she was often unreimbursed. This was often a subject of frustration for her. The paperwork for reimbursement would frequently be returned marked "Improper Code" or for other reasons. The Respondent noted that certain applications for reimbursement were never returned, and reimbursement was had. These were cases which involved throat swabs, urine testing and several other minor procedures. The Respondent began to bill Medicaid and Medicare using the codes for these simple procedures in order to be reimbursed somewhat for her efforts. She did this, even in cases involving lengthy treatment, where she could have been reimbursed many times the amount she was actually reimbursed because she coded the requests for reimbursement with the codes for lesser procedures.[3] Respondent admits freely to her actions and has been convicted for them. However, Judge Angeletti was merciful in his treatment of her in recog-

nition of her value as a physician, the massive debt to society she has paid, and the tragedy and trauma to her family.

Finding of Fact XIV. Respondent stated that she frequently billed throat cultures to Medical Assistance in order to get more money to cover her increasing malpractice insurance premiums.

Finding of Fact XV. There is no evidence in the record as to whether Respondent's practice is competent or not competent or that she practices good or bad medicine.

Finding of Fact XVI. Respondent has continued to practice medicine since her conviction and no evidence was presented of any failure on her part to comply with the law or practice competently. Respondent attempted to commit suicide. Respondent is in treatment and her treating therapists state that she is successfully progressing in treatment.

Finding of Fact XVII. The Respondent is practicing medicine and accepts all who come, although that number has been reduced to five to seven patients per day. She takes all patients whether they are able to pay or not. If they have medicaid and Medicare, she is barred from billing on those cases for a period of five (5) years.

Finding of Fact XVIII. Respondent is not appealing these disbarments from Medicaid and Medicare.

Finding of Fact XIX. Respondent can and does bill private insurance companies.

Finding of Fact XX. There is no evidence that Respondent is presently fraudulently billing private insurance companies.

Conclusions of Law

Based on the foregoing Findings of Fact by clear and convincing evidence, by a vote of a majority of its full authorized membership, the Board concludes as a matter of law that Respondent pleaded guilty with respect to a crime involving moral turpitude whether or not any appeal or other proceeding is pending; and that Respondent's plea of guilty was not overturned at any stage of an appeal or postconviction proceeding (HO §14-504(6)).

Order

Based on the foregoing Findings of Fact and Conclusions of Law, by a vote of a majority of its full authorized membership, it is this 6th day of November 1989

ORDERED that Respondent's Motion to Dismiss be DENIED; and be it further

ORDERED that the Board's charges under HO §14-504(22) are DISMISSED together with underlying charges HO §14-504(3), (12), and (25) insofar as Respondent was NOT convicted by a court of any state or country for an act that would be grounds for disciplinary action under this section; and be it further

ORDERED that Respondent's license is REVOKED, effective November 27, 1989, and be it further

ORDERED that on or after October 1, 1990 Respondent may petition the Board for reinstatement of Respondent's license; and be it further

ORDERED that in no event will Respondent's license be reinstated before November 27, 1990; and be it further

ORDERED that in the event Respondent petitions for reinstatement of her license, Respondent must, at minimum, submit evidence of compliance of continuing education requirements together with evidence of having taken 50 hours of continuing education in medical billing practices; and be it further

ORDERED that Respondent bears the burden of proving that Respondent should be granted reinstatement of her license; and be it further

ORDERED that between November 8, 1989 and November 27, 1989, Respondent must notify her patients that she will cease being their treating physician and said notification must, at minimum, include the following:

a. the identity of any physician to whom the Respondent's practice will be referred;

b. an explanation that the patients are free to choose another physician and the telephone number of the Medical and Chirurgical Faculty whom the patients can call for such a referral;

c. state in detail in order to comply with §4-305, State Government Article, what arrangements Respondent will make with regard to the patient's medical records; and be it further

ORDERED that this is a final order.

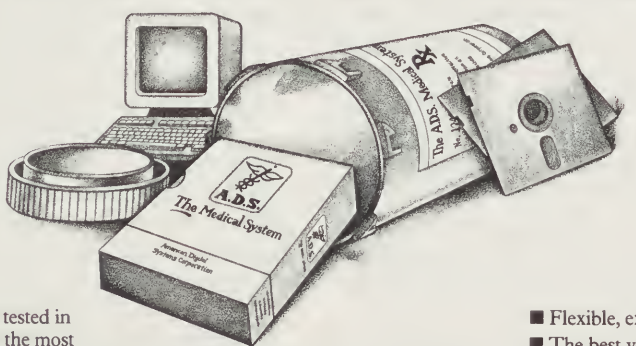
ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Comment

Medicaid fraud is one of the most serious violations of the Medical Practice Act that this Board is called on to adjudicate. Physicians' billings for professional services, whether to the state or federal governments or to private insurers, are done primarily on an honor system. Payors are overwhelmed by the volume and complexity of the billing process, and audit capability is limited. Society and the medical profession itself have a right to expect physician behavior in assigning money values to medical services to be scrupulously honest and accurate. Conscious and deliberate fraud in billing contributes to an increasing distrust of doctors and is an offense against the honor and trust the great majority of physicians deserve.

3. This finding incorporates the Hearing Officer's statements in proposed Finding of Fact No. 5 which he found Respondent credible to how her practice of fraudulent billing commenced. "After carefully questioning the Respondent on all aspects of the facts of this case, I am convinced by the clear and convincing evidence available to me that the Respondent was at all times candid with me about billing for lesser procedures than she was actually entitled to bill for because of the administrative problems involved."

In particular, fraud in the Medicaid system is especially censurable. This program is desperately underfunded and every misused dollar contributes to the problem of providing care to the indigent in Maryland. Frustration with perceived complexities and inequities of the Medicaid payment system is no excuse for physicians devising their own rules for dealing with it. In this case, the physician not only admittedly defrauded the government but also falsified patient records. All health professionals must rely on the accuracy of medical records. This is an egregious case.



The Legislature, speaking for the citizens of Maryland, has clearly articulated a policy for the Board to follow in these cases. The Board has chosen to use its discretionary powers and revoke Respondent's license.

Commentary
The Year of the Infant

At a media event held in Hunt Valley in January, Governor William Donald Schaefer announced 1990 to be The Year of the Infant. What unmet needs do they have? How serious are the problems besetting our most important resource in Maryland and in the nation - our children?

The American Academy of Pediatrics at the national level and the Maryland Chapter within our state firmly believe there is ample evidence documenting the failure of our political system to deal with our children's problems. The neonatal mortality rate, the adolescent pregnancy rate, the drug problem, and the evidence of the failure of the school system to adequately educate our children speak to these unmet needs. The Children's Defense Fund State Fact Sheet 1990, "How Maryland Treats Its Children," states that of twenty measures of children's needs, Maryland is adequate in only six. Our state is *not* making adequate progress in early prenatal care, infant mortality, and children in poverty.

An effort is being made to confront these problems. Politically, the establishment of a subcabinet position of Secretary of Infants, Children, and Families follows a recommendation of the American Academy of Pediatrics that each state establish such a department in order that the problems of our children can be coordinated between the Departments of Health and Mental Hygiene, Education, and Social Service and the private sector. The appointment of Dr. Nancy Grasmick, an educator, to this important post increases the likelihood of dealing with these problems in a comprehensive manner.

Though State funding for new programs is difficult at this time, it is also difficult to understand why previous excellent programs have not been maintained through the years. Due to progressive lack of funding, many school districts that had excellent psychological and counseling services have seen such programs wither. The number of school failures remains fairly constant. With fewer psychologists available to adequately test the children, there is less ability to write an educational prescription for each individual child in need. Laws have been written at the federal level to mandate these services, yet services remain unmet or have become scarce in many areas of our state. P.L. 99-457 was passed by Congress and amended as P.L. 94-142, The Education of the Handicapped Act, by adding Part H, a discretionary formula grant program for infants and toddlers with handicaps. Part H provides a five-year phase-in period for states in planning, developing and implementing a statewide comprehensive coordinated system of early intervention services.

Congress recognized that infants and toddlers and their families require comprehensive services unlikely to be fully available through any one state, public, or private agency. As part of the implementation of the program, the Interagency Coordinating Council was appointed by Governor Schaefer to assist and advise the State in planning. All of the state agencies, as well as private providers, parents, personnel trainers, and medical practitioners are participating on the Council. The Maryland State Department of Education is the designated Lead Agency responsible for planning and administering the program. This law specifically notes that private healthcare delivery must be included at all levels of this law. To date, little involvement of physicians in private practice has occurred. Further efforts must be made in this regard.

The American Academy of Pediatrics has made access for children to health care its number one priority. The Maryland Chapter has followed the American Academy and is introducing legislation this year in Maryland's Legislature to mandate wellness care for children. The proposed legislation would insure that any family that has health insurance within Maryland would have immunizations and anticipatory guidance, together with complete physical examination, medical history, and developmental assessment included. These services would be provided according to the schedule recommended by the American Academy of Pediatrics. The proposal would provide equity for children and insure them for their greatest needs: preventive medicine. The cost of such a program has been estimated to be $2.87 per month per family in 1988 dollars by the Actuarial Research Corporation of Annandale, VA. As an active participant in the Governor's Commission on Health Care and Financing (The Feinblatt Commission), The Subcommittee on Mandated Benefits clearly recognized the need for preventive health services for children. The final report of the committee, including a subsection regarding this subject, passed without dissenting vote.

This proposed legislation, however, does not affect the many uninsured children within Maryland. Appropriate legislation must be introduced and passed to cover the approximate 100,000 children who either are not covered by Medicaid and whose income of the family is less than 200 to 250 percent of the federal poverty level or are insured but do not have preventive health services included in their insurance. At several meetings of the pediatricians representing the State of Maryland and the Feinblatt Commission staff, these issues were discussed, and though the final report of the Commission is not yet available, it is hoped that some solution to access to healthcare for these children will be forthcoming.

The American Academy of Pediatrics has a different approach to this problem. They believe all children should have access to healthcare throughout the country, and there should be no significant differences in availability from one state to another. They, there-

fore, are proposing national health insurance for children. This national health insurance system would be pluralistic, allow free choice of physicians by the patient, and would use all current Medicaid funding to help fund this insurance program. An additional expenditure of approximately $24 billion would be needed.

In addition, Governor Schaefer has appointed a Commission on Adolescent Pregnancy that is now throughout the state. Plans are also being developed by Dr. Grasmick and the Office of Children, Youth, and Families to meet the pressing needs of children. We believe that her enthusiasm, dedication, and ability will provide the leadership that allows Maryland to meet the problems of children and celebrate The Year of the Infant by increased services to children.

ROBERT D. BRODELL MD, FAAP

Dr. Brodell is President of the Maryland Chapter of the American Academy of Pediatrics.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-In format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.

Come Grow With Us...

We are looking for physicians in:
- **Orthopedics**
- **Pediatrics**
- **Family Practice**
- **Emergency Medicine**

Nestled in the Eastern Panhandle of West Virginia, Jefferson Memorial Hospital is a non-profit community hospital serving the health care needs for over 75 years. Located in the fastest growing county of the State – it is just minutes from Virginia and Maryland – 60 miles from D.C. amidst the Blue Ridge Mountains and Shenandoah River: truly the best of both worlds at your doorstep.

Hoping to increase our medical staff to keep pace with our growth, it's no wonder Jefferson County is "on the map."

Wayne B. Leadbetter MD was elected to fellowship of the American College of Surgeons at the 1989 Annual Clinical Congress of Surgeons. Recently Dr. Leadbetter was an invited speaker at the First International Olympic Committee World Congress on Sports Medicine in Colorado Springs, where he spoke on the "Use and Abuse of Corticosteroids in Sports Medicine" and the "Inflammatory Processes in Overuse Tendon Injury."

■ ■ ■

Robert G. Lisk MD was re-elected Chairman of Public Education for the American Academy of Otolaryngic Allergy at its recent national meeting. Dr. Lisk also serves as a member of the Academy's Executive Council.

■ ■ ■

Dan K. Morhaim MD, Owings Mills, recently was appointed to Governor William Donald Schaefer's Advisory Committee on Recycling. He will serve a three-year term which began in November 1989. Dr. Morhaim is the Chairman of the Department of Emergency Medicine at Franklin Square Hospital Center.

■ ■ ■

Barry S. Tatar MD was given special recognition as a Fellow at the recent national meeting of the American Academy of Otolaryngic Allergy.

■ ■ ■

R. Lane Wroth MD was named the first recipient of the Medical Director Leadership Award at the recent American Managed Care and Review Association (AMCRA) Annual Conference and Exhibition. Dr. Wroth is medical director of the Delmarva Health Care Plan in Easton, MD. The annual award recognizes a managed care medical director who demonstrates exemplary performance of AMCRA's mission and is funded by an educational grant from Marion Laboratories, Inc. Dr. Wroth was selected by the Executive Committee of AMCRA's board of directors from nominations submitted by member plans. An active AMCRA member, he is chairman of the association's medical issues section and serves on the AMCRA board of directors.

Maryland Society of Cardiology

Raymond D. Bahr MD

In November the Society elected the following officers: President *Raymond D. Bahr MD*, Secretary-Treasurer *Dean Taylor MD*. The immediate Past-President is *Kenneth B. Lewis MD*, and the Executive Board members are *Mark Applefeld MD, Donald Dembo MD, Samuel Goldberg MD, John Hornbaker MD, and Carl Tommaso MD.*

The Maryland Society of Cardiology was begun in 1975 as an organization to promote high quality cardiologic care in the hospital, the physician's office, as well as in the community. It also provides a mechanism for peer review and expert opinions on subjects germane to cardiologic practice. It compliments and supplements the aims and activities of the Maryland Society of Internal Medicine, American College of Cardiology, American Heart Association, and the American College of Physicians.

The Society consists of 110 active members located throughout Maryland and meets annually in November with a formal lecture on a cardiology related subject. New cardiologists moving into the state or just beginning practice are encouraged to join. ■

The Science of Medicine

Don't Deny Chest Pain—
The First Two Hours Are Vital!

Most of us are aware of such primary risk factors in heart attacks as elevated cholesterol, smoking and high blood pressure. Many of us are unaware of the risk of ignoring the early warning signs of chest pain. Denial and delay cause severe damage to vital heart muscles, prevent full recovery and, in many instances, cause death.

Nearly 70% of those suffering a heart attack die within the first two hours. Prompt attention to warnings, combined with modern techniques and an array of drugs, can significantly reduce fatalities.

Raymond D. Bahr M.D. is the Director of the Paul Dudley White Coronary Care System and founder of the Chest Pain Emergency Center at St. Agnes Hospital, the first in the nation. Dr. Bahr has instituted programs of community education in the risks of ignoring chest pain. Programs are also available to business and industry. Action is most important at the stage of early intermittent chest discomfort or pain. When the pain becomes severe and undeniable, it's often too late to save life or the important heart muscles that would ensure full recovery and preserve a higher quality of life.

At the St. Agnes Chest Pain Emergency Center, patients are examined and treated immediately by trained physicians in emergency medicine, cardiology and a special nursing staff. There is no delay. After identification of the problem and stabilization, patients continue to be monitored in the Chest Pain Emergency Center, until they are transferred to the Hospital's Coronary Care Unit.

Early cardiac care is presently reaching its peak with the development of thrombolytic agents, angioplasty and early coronary bypass surgery. But all of these measures are most effective if the patient is aware of the necessity of prompt response at the early stages of chest discomfort or pain.

The Art of Caring

HEART ATTACKS– Recognize the Symptoms

Why Is It The Number One Killer Of Adults In The U.S.A.? Because when it is beginning, it is not recognized. If clues can be found at this stage, the entire field of cardiology can be changed to prevention of heart attacks rather than treating the heart attack and resultant heart damage. Beginning symptoms of a heart attack (prodromal) are milder and are described as pressure rather than pain. They occur in a stuttering way for hours to days before they become painful and constant. They are easily denied in the face of a busy schedule that is more demanding. Undivided attention by first responders can help to get these patients into early cardiac care centers in emergency rooms more quickly. Here the patient's symptoms can be checked out and cardioprotection given if necessary. The nation has 6700 community hospitals. It needs such an approach because the heart of the problem is within these communities.

Get the right signal for you and your family. Be safe at home. Learn how to act when it counts. A free speaker's bureau is available in Maryland and surrounding states. Call **(301) 368-3217,** or write Dr. Raymond D. Bahr, St. Agnes Hospital, 900 Caton Avenue, Baltimore, MD 21229.

A MESSAGE FOR THE HEARING IMPAIRED

The Resound Hearing Aid, using the technology developed by ATT-Bell Lab and Rodney Perkins, M.D. (Stanford University) is a hearing device of unsurpassed cosmesis and quality. For those who qualify, this device provides superior performance, comfort and acceptance when compared to all the existing electroacoustic devices for the hearing impaired. A digital hearing aid using the Texas Instruments TM 532020 digital signal processor programmed specifically for the hearing aid user to match their individual need.

The device is implanted through a minor recontour surgical procedure of the ear done under local outpatient surgery. Following this the high performance sound processing device is placed deep in the ear canal near the ear drum. The procedure is now being done at Harbor Hospital in Baltimore, Maryland.

The Resound has the ability to compensate for the distortion of sound recruitment common to regular hearing aid users. The Resound adjusts the intensity for each frequency to fit into the individuals comfortable hearing range. Thus, the distortion with high tones of speech, the loss of consonants and indistinctness of speech, the loss of directionality and the wind noise are practically eliminated with the Resound. The programming of the device is done by Dr. Kathryn Copmann, Ph.D. audiologist and the evaluation and implantation is done surgically by Otolaryngologist Lewis B. Newberg, M.D.

To date the patients that have been seen and operated on are all quite satisfied with the quality of sound; and cosmetically were quite surprised and pleased.

In addition to being able to offer the Resound Hearing device, a number of additional services are available including transtympanic and operative electrocochleography for Menieres disease and Audiant bone conduction hearing devices and cochlear implants. A full range of rehabilitative ancillary support are available for those who diagnostically qualify for these procedures.

For further information you may contact: Lewis B. Newberg, M.D.

DIRECTOR OF AMBULATORY MEDICINE

Department of Medicine, Franklin Square Hospital Center, Suburban Baltimore Metropolitan Area

Major community teaching hospital Department of Medicine seeks nominations and applications for full-time faculty position of Director of Ambulatory Medicine. The Internal Medicine Residency Program has 45 residents in training. Responsibilities of Director will include planning and implementing methods for teaching Ambulatory Medicine to residents and students, expanding existing curricula in block and continuity time, coordinating the evaluation of resident and faculty performance at ambulatory sites, and involvement in patient education and quality review issues. Director will be involved in coordinating the educational activities of a newly renovated outpatient center housing both general and subspecialty medicine clinics. Director will play a major role in strategic planning process to extend training in Ambulatory Medicine to community sites away from the main campus.

Special interests and/or expertise in medical consultation, preventive medicine, clinical epidemiology, substance abuse, computer applications, and/or interviewing skills are especially desirable. Director will be involved in teaching in the inpatient setting. Limited private practice available if desired. Candidates must qualify for faculty appointment in the Departments of Medicine of the University of Maryland School of Medicine and of the Johns Hopkins University School of Medicine.

Women and minority candidates are encouraged to apply. Applicants should send curriculum vitae to: Daniel C. Hardesty MD, Chairman, Dept. of Medicine, Franklin Square Hospital Center, 9000 Franklin Square Dr., Baltimore, MD 21237 (301-682-7155).

Daljit S. Sawhney, M.D. (301) 760-9300

YOUR SPECIALTY IS WORTH AN EXTRA $8,000 A YEAR.

If you're a resident in any of the following specialties:

- anesthesiology
- orthopedic surgery
- general surgery
- neurosurgery
- colon/rectal surgery
- cardiac/thoracic surgery
- pediatric surgery
- peripheral/vascular surgery
- plastic surgery

you could be eligible for an $8,000 annual stipend in the Army Reserve's Specialized Training Assistance Program.

You'll also be using your skills in a variety of challenging settings, from major medical centers to field hospitals, and there are opportunities for conferences and continuing education.

We know your time is valuable, so we'll be flexible about the time you serve. Your immediate commitment could be as little as two weeks a year, with a small added obligation later on. If you'd like to talk to an Army Reserve physician, or if you'd like more information about the stipend program or other medical opportunities, call our experienced Army Reserve Medical Counselor.

BE ALL YOU CAN BE.®
ARMY RESERVE

The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative *Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf— specialists who know health care *and* insurance — so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton Insurance Company. Call your independent insurance agent today.

Maryland. Tried & True.

It's true. In today's rapidly changing health care environment, your professional liability insurance must be strong, stable, and reliable. You shouldn't have to worry about whether your company will still be here to protect you in the future.

For more than a decade, thousands of Maryland physicians have found the protection they need with Medical Mutual Liability Insurance Society of Maryland. A financially sound, conservatively managed specialty insurer, Medical Mutual is recognized as expert in the area of professional liability insurance.

Backed by a professional staff with years of experience in underwriting, claims handling, and risk management, our professional liability insurance provides strong, reliable protection—plus the expertise, service and attention that only a specialty insurer can offer.

We are proud to be serving thousands of your colleagues already, Maryland physicians who have found the right combination of protection, flexibility, and service for their practices. If you haven't met us yet, call your broker or call our Member Services Department at 1-800-492-0193.

Medical Mutual. Try us and see what we can do for you.

A Choice.

Just what the doctors ordered.

Now that you have a choice of professional liability insurers, how do you compare your options? Consider these important points:

- **The protection you get from your policy**

Princeton's exclusive *Occurrence Plus* policy gives you comprehensive protection - including "tail" coverage - that's complete when purchased. With some other policies on the market, you might wait years before receiving such coverage.

- **The company's experience in medical malpractice claims management**

Princeton is known for providing a strong defense against meritless claims, and that helps protect your professional reputation. Our exceptional claims management record reflects our years of experience in resolving medical malpractice cases.

- **The company's financial strength and stability**

With its parent organization, Princeton Insurance Company ranks as the nation's 12th largest professional liability carrier for medical professionals. And Princeton has one of the lowest loss ratios among the top 20.

To learn more about how Princeton compares, contact one of the independent insurance agents that represent Princeton.

One Insurance Agency Can Handle All Of Your Policies

Contemporary Insurance Services:

* Is prepared to advise you concerning all malpractice insurers
* Carries very low cost term insurance and high-grade universal and whole life products
* Carries excellent disability, overhead and buy-sell products with liberal policy definitions and competitive rates
* Carries excellent health insurance products
* Carries excellent office liability products

Contemporary Insurance Services is one of the largest brokers of malpractice insurance to Maryland physicians. Many of our clients rely on us for all of their insurance needs. Let us show you why many of our clients prefer to handle all of their insurance needs through one agent.

In today's market, you need an insurance broker you can rely on. For more information, complete and return:

ROCHE

PRESIDENT'S ACHIEVEMENT AWARD

Presenting the winners of the 1989 Roche President's Achievement Awards

Roche Laboratories is proud to honor these outstanding sales representatives, chosen for their unparalleled dedication to the healthcare field, professionalism and consistent high level of performance. Please join us in congratulating these exceptional individuals.

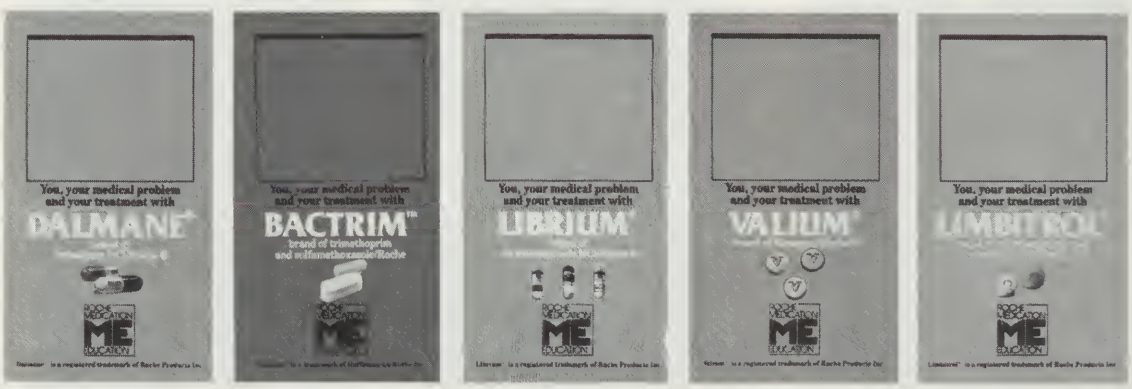
John B. Bailey

Wendy Rucci

Henry C. Shimonkevitz

Turn to the following page and find out how your award-winning Roche representative can help both you *and* your patients.

Your Roche Representative Would Like You To Have Something That Will...



ROCHE®

... improve patient satisfaction with office visits.
... improve patient compliance with your instructions.
... reduce follow-up calls to clarify instructions.

Roche product booklets ...

- offer a supplement to, not a substitute for, patient contact.
- support your specific instructions to the patient.
- provide a long-term reinforcement of your oral counseling.
- are available in *Spanish*.

Because you are the primary source of medical information for your patients, we invite you to look over the Roche product booklets shown below. Ask your Roche representative for the new catalog brochure of patient education materials and for a complimentary supply of those booklets applicable to your practice, including the WHAT IF Book in large type.

APRIL 1990
RABIES IN MARYLAND

Rabies cases have increased during 1989 for the first time since the peak of 1,100 reported cases in 1984. The 389 cases of animals found positive by laboratory testing (see Table 1) represented a 51 (15.1%) case increase over the previous year. Further, 1989 was the first year that an additional county (Kent County) became affected since Cecil County in 1986.

Raccoon Epizootic

The current Maryland rabies epidemic in animals (or epizootic) is a part of the Mid-Atlantic epidemic which had its origins in the Eastern Panhandle of West Virginia in 1977. Maryland became involved in September of 1981 when rabies crossed the Potomac River into Allegany County. The current epidemic is maintained by Maryland's raccoon population. It has advanced about 25 miles per year, delayed only briefly by interstate highways and for a somewhat longer time by large rivers and mountain ridges. In a few localized instances, the advance or expansion was halted for extended periods of time for unknown reasons. Spillover from the raccoon accounts for rabies in other wildlife, the cat and the dog and other domestic animals, but there is no evidence that rabies is transmitted within these other populations. There have been no human deaths in this current epidemic.

Rabies Increase

Of the approximately 5,000 specimens tested, raccoons represented 295 of all positive animals and is a 15.6% increase over the number of cases in 1988. Cat rabies total 16 (+23.1%), fox - 23 (+9.5%), dog - 2 (vs 0), skunk - 19 (0.0%) and all other animals (4 groundhog, 3 equine, 1 sheep) - 8 (-11%). It must be kept in mind that the number of rabies positive animals does not reflect a prevalence (total cases at a point in time) but only the number of laboratory confirmed rabid animals. Similarly, the total number of animals tested is not a denominator (total population of susceptibles) in the usual sense, but rather the total of animals submitted for testing. These data which are used to reflect changes in reported rabies is a recognized convention since true prevalence (numerators) and true population totals (denominators) are not available. Because rabies is an acute, inevitably fatal disease, prevalence and incidence may be thought of as the same value.

Bat Rabies

Throughout this overlying raccoon rabies epidemic, bat rabies continued to be endemic throughout Maryland. The 26 rabid bats reported in 1989 was a 23.8% increase over the previous year but rabies in bats cycles independently in nature and is epidemiologically unrelated to rabies in terrestrial rabies (rabies in four-footed animals). The number of rabid bats has varied greatly from year to year over the past 20 years (minimum 3, maximum 51) . During the entire decade of the 1970's, only four terrestrial animal rabies cases were identified, while there was an average of 20.7 rabid bats per year. The most recent human rabies death in Maryland occurred

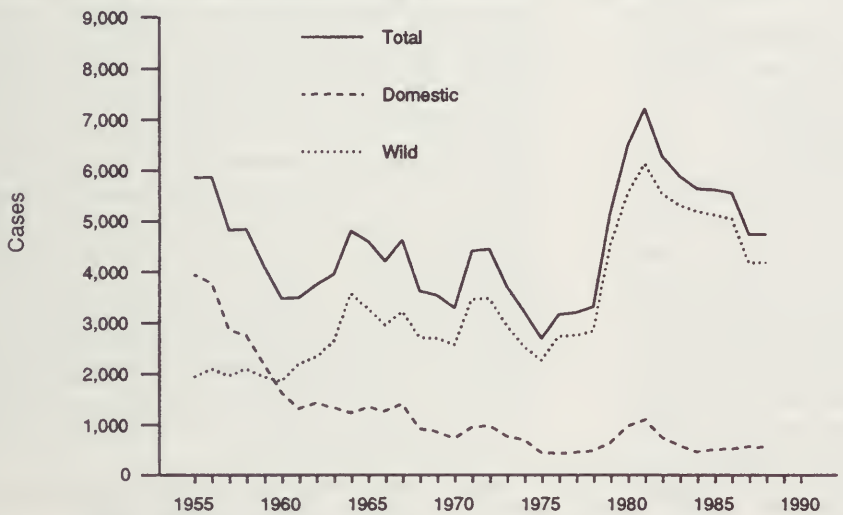
in 1976 (Cecil County) as a result of a bat bite. (A previous death was in 1954 [Baltimore City] as a result of a dog bite.)

Public Health Strategy

Public health concern and involvement with animal rabies results from the fact that rabies in humans must be regarded as always fatal once signs of the disease are evident. Early detection of a case of human rabies is of no value and total prevention of rabies in humans is the only public health alternative. Supportive care has extended in recent years the period of illness but has not prevented death. Because rabies is a fatal disease, current recommendations for humans who are exposed to rabies require postexposure prophylaxis to be administered regardless of the individual's



previous history of vaccination, although the regimen may be modified.

Typical of most diseases transmitted from animals to humans (the zoonoses) human-to-human transmission is rare or does not occur. The prevention of human rabies must concentrate upon the animals which may expose people and upon postexposure prophylaxis of exposed persons when indicated.

Rationale for Treatment

Each possible exposure must be evaluated individually. Local and State public health officials should be consulted if questions arise about the need for prophylaxis. In Maryland the following factors should be considered before specific antirabies treatment is begun:

FIGURE 1. Cases of rabies in animals, by year, United States, 1955-1988

*** Species of biting animal**

Carnivorous wild animals (especially the raccoon, fox, skunk and bat) represent the greatest risk. Unless an animal is tested negative, postexposure prophylaxis should be begun. If treatment has begun and subsequent laboratory testing shows the exposing animal is not rabid, treatment can be discontinued. Because the period of rabies virus shedding in infected wild and exotic animals is unknown, confinement and observation is not appropriate.

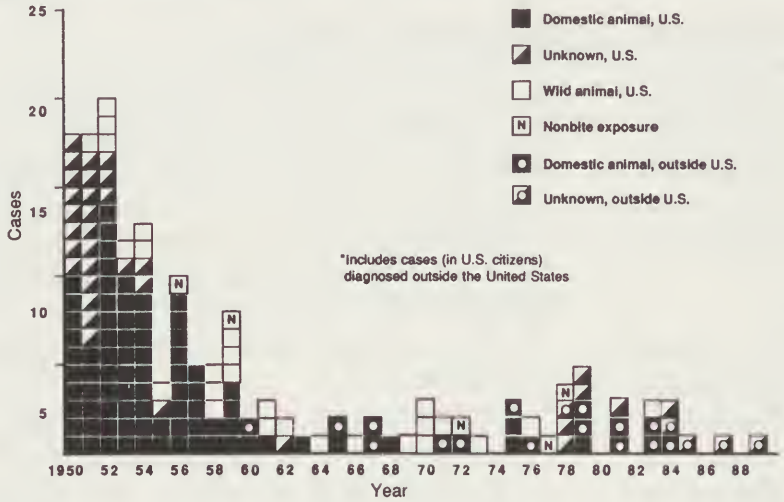
Confinement and observation of a healthy dog or cat and farm animals is a proven, appropriate procedure to rule out exposure to rabies. Groundhogs (46) and squirrels (5) have been found to be rabid in Maryland during this epidemic. Involvement of these rodents is probably the result of exposure to raccoons with which they shared burrows (groundhog) or tree holes (squirrels). Other rodents and rabbits are rarely found infected with rabies and have not been known to cause rabies in humans in the United States.

*** Circumstances of the biting incident**

An unprovoked attack is more likely than a provoked attack to indicate an animal is rabid. Bites which occur while attempting to feel, touch or handle an apparently healthy animal should generally be regarded as provoked.

*** Type of exposure**

Two categories of exposure should be considered. A bite is any penetration of the skin by teeth. A nonbite is contamination with saliva of scratches, abrasions, open wounds or mucous membranes. Casual contact, such as petting a rabid animal (without a bite or nonbite exposure) does not constitute an exposure and is not an indication for prophylaxis.



Principles of Control

The measures which are most valuable for human rabies prevention are:

1. Rabies vaccination of owned dogs and cats (to prevent the introduction of rabies into the home environment).

2. Alerting citizens to avoid wild animals and stray dogs and cats (The most uniform sign of rabies in any creature is a change in expected behavior), and

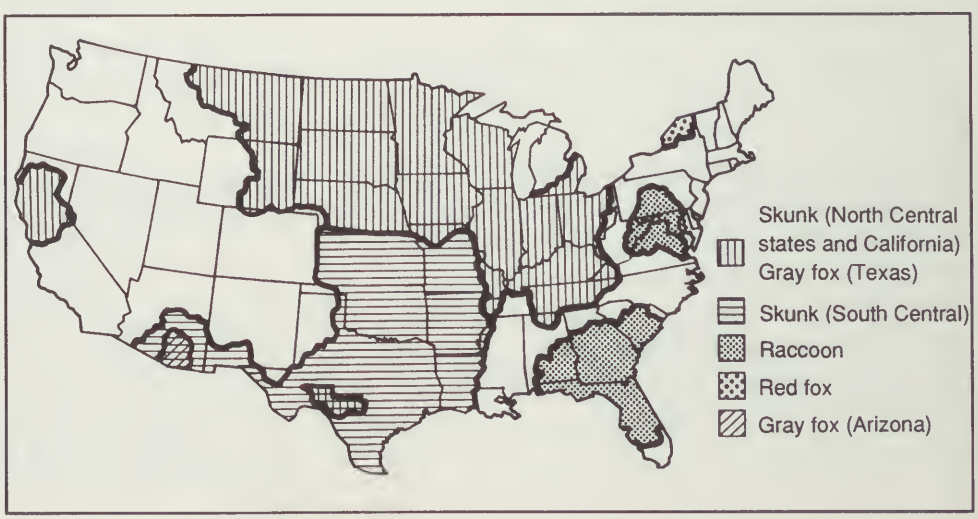
FIGURE 2. Cases of rabies in humans, by year and exposure category, United States*, 1950-1988

3. Prompt administration of postexposure prophylaxis to persons who are exposed to rabies (when required, postexposure treatment is safe and effective).

Other useful measures are licensing and restriction of household pets (leash laws) and the control of stray dogs and cats.

Fluorescent Antibody Test

Any animal which is capable of transmitting rabies will be found laboratory positive by the Fluorescent Antibody Test. This quick, reliable, highly sensitive and specific test for rabies is the standard test used in Maryland. It is not necessary and serves no useful purpose to delay laboratory testing of a domestic animal if circumstances of the bite or the health of the moribund animal as evaluated by a veterinarian do not justify waiting the 10-day confinement and observation period.



Rabies Trends in the US

Figure 1 shows that reported wildlife rabies increased greatly during the past decade while domestic animal rabies continued at a low level following a dramatic decline (mainly in dogs) beginning in the 1950's when effective canine rabies vaccine came into use.

The decline in human rabies cases in the United States (Figure 2) parallels the decline in exposure to rabid domestic animals. Most deaths recorded are the result of exposure outside the United States and are usually due to domestic animals.

Human (postexposure) and animal (preexposure) antirabies biologics protect against all antigenic types of rabies virus. Specific antigenic types of rabies virus have been associated with wildlife species in which the types are usually maintained (Figure 3). The Middle Atlantic and the South Atlantic regions with raccoon epizootics are the only regions where the raccoon type is found. Rabies virus found in bats is different from any of the terrestrial rabies virus types and is represented by a spectrum of characteristics rather than a single district or single antigenic type.

FIGURE 3. Distribution of five antigenically distinct rabies virus strains and the predominant wildlife species affected, contiguous United States, 1988

Systemic and Combined Modality Therapy for Lung Cancer

Lung cancer is both the most common malignancy and the leading cause of cancer-related death in the United States. It is estimated there will have been 155,000 new cases diagnosed in 1989 (3,000 in Maryland), with 142,000 lung cancer deaths (2,700 in Maryland) during that year. Tobacco smoking is responsible for 85 percent of male lung cancer cases and 75 percent of female cases. Lung cancer incidence and mortality rates continue to climb, particularly in women. Despite decreasing prevalence of smoking among adults, it will be many years before these behavioral changes affect incidence rates.

Four major types of lung cancer account for approximately 95 percent of lung tumors. Based on specific biologic properties of the cancer cells, lung cancers are classified as either small cell lung cancer (SCLC) or nonsmall cell lung cancer (NSCLC). SCLC has distinctive neuroendocrine properties and accounts for 20 to 25 percent of lung cancers; NSCLC account for 75 to 80 percent of lung cancers. The three major types of NSCLC are epidermoid carcinoma (Squamous cell), adenocarcinoma, and large cell undifferentiated carcinoma, and, while treated identically, they may have somewhat different clinical characteristics. It has been noted that the relative percentage of adenocarcinoma appears to be increasing.

At present, despite our increased understanding of the biology of lung cancer as well as advances in the treatment of the disease, only 13 percent of all lung cancer patients will survive 5 years. The reasons the majority of lung cancer patients are not cured are obvious: what is needed to improve survival is the development of more effective systemic agents (chemotherapy, biologic response modifiers) as well as the utilization of combined-modality therapy.

Nonsmall Cell Lung Cancer

The high failure rates associated with surgery and radiation therapy in NSCLC have led to the use of adjuvant as well as neoadjuvant therapy to eradicate micrometastatic disease and reduce local recurrences. The Lung Cancer Study Group (LCSG), in a randomized study involving stage II and III adenocarcinoma and large-cell undifferentiated carcinoma, demonstrated that patients receiving postoperative chemotherapy (cyclophosphamide, doxorubicin and cisplatin - CAP) monthly for 6 months had prolonged time to recurrence of disease and survival than patients receiving postoperative immunotherapy (intrapleural BCG and oral levamisole).[1] The LCSG also evaluated postoperative chemotherapy and radiotherapy in patients with resected lung cancer.[2] Patients were randomized to receive thoracic radiotherapy either alone or with chemotherapy (CAP). The patients who received both the thoracic radiotherapy and chemotherapy postoperatively had a prolongation of disease-free survival.

The use of preoperative chemotherapy with and without radiotherapy is gaining interest. Several nonrandomized studies suggest that such therapy causes unresectable disease to become resectable. Moreover, the therapy also may be effective in preventing local recurrences.

In patients with stage III disease, Cancer and Leukemia Group B (CALGB) compared radiation therapy (60 Gy in 6 weeks) versus sequential vinblastine and cisplatin followed by radiation therapy.[3] Median survival was significantly increased with the sequential chemoradiotherapy compared to the radiotherapy alone (16.5 months vs. 8.5 months). In an ongoing NCI high-priority study conducted by the Radiation Therapy Oncology Group (RTOG) and the Eastern Cooperative Oncology Group (ECOG), the two therapies mentioned above are being compared to twice-daily fractions (hyperfractionation) radiation therapy (total dose 69.8 Gy).

For recurrent or metastatic NSCLC, chemotherapy is used in selected patients. Although there is no chemotherapy that can be considered "standard" in NSCLC, cisplatin-containing regimens offer palliation to patients.[4] The response rates to most chemotherapeutic regimens are less than 40 to 50 percent and the responses are usually partial and of short duration. The development of new drugs to treat advanced NSCLC is needed. Presently, the Johns Hopkins Oncology Center is conducting a phase I study of Ipomeanol in patients with advanced lung cancer.[5] In preclinical studies this drug demonstrated significant activity against lung cancer. It remains to be seen whether the same activity will occur in patients with lung cancer.

Small-Cell Lung Cancer

SCLC is a rapidly growing tumor with a propensity for early dissemination to distant sites. Although responsive to both chemotherapy and radiation therapy, systemic chemotherapy is the cornerstone of therapy for SCLC. It should be noted, however, that the role of surgery in SCLC is presently being defined. The LCSG recently completed a study comparing radiation therapy to thoracic surgery and radiation therapy in patients with limited stage-SCLC who initially responded to chemotherapy. The results of the study are being analyzed. SCLC is usually divided into "limited" and "extensive" stages. In general, patients with limited disease have a median survival of 12 to 18 months with 10 to 20 percent alive and free of disease at two years; patients with extensive disease have a

median survival of 8 to 12 months with fewer than 5 percent having relapse-free survival at two years.

There are at least ten drugs that are active as single agents in the treatment of SCLC. With so many active drugs, many different effective combination chemotherapeutic regimens have been used to treat SCLC.

One of the most effective regimens used in the treatment of SCLC is etoposide and cisplatin. Not only has it been used alone in the treatment of extensive-stage SCLC, but also its use concomitantly with radiation therapy in patients with limited stage disease has increased their chance for a prolongation of disease-free survival. In a nonrandomized trial evaluating hyperfractionated radiation therapy combined with etoposide and cisplatin, the complete response rate was 93 percent with an actuarial survival of 54 percent at two years.[6] In an ongoing NCI high-priority study conducted by the RTOG and ECOG to evaluate the above regimen, patients with limited-stage SCLC are randomized to receive etoposide and cisplatin given concomitantly with either standard thoracic radiation therapy or hyperfractionated radiotherapy.

Lung cancer remains a major health problem in the United States. Despite advances being made in our understanding and treatment of lung cancer, more effective systemic therapies as well as combined modality approaches are needed to produce significant improvement in survival.

DAVID S. ETTINGER MD
Associate Professor of Oncology and Medicine
Director, Lung Cancer Program
The Johns Hopkins Oncology Center

To Delay Can Prove Fatal!

Grave reasons why heart attack symptoms won't wait.

Don't make a fatal mistake. Take immediate action when heart attack symptoms begin.

As doctors, we say this over and over again, maybe to the point of overkill. But the fact is—there is an "overkill" going on: the needless loss of life that occurs when people fail to act in time. And heart attack is still the No. 1 adult killer in America today.

Help eliminate the fatal delay. Free VCR tapes are available on how to set up early cardiac care in your hospital's emergency room and network with the community using a heart attack educational outreach program. The longer you look, the more we stand out.

Our commitment to provide local support and service for the nation's leading medical office computer system, THE MEDICAL MANAGER®, has made us the region's leading reseller for the last three years.

Our approach to client service is based on:

- THE MEDICAL MANAGER®, the most popular medical office computer system, with more than 7,000 installations nationwide.
- A network of three local offices staffed with experienced medical office management people and our own computer technicians.
- A system which includes any, or all, of the following:
  - ◇ Medical Billing
  - ◇ Clinical History
  - ◇ Electronic Claims
  - ◇ Scheduling & Recalls
  - ◇ Word Processing
  - ◇ Accounting

Interested? Call us for a list of references. Our clients can tell you about superior support and system performance.

Executive Director's Newsletter

April 1990

1990 Annual Meeting

Physicians are reminded to preregister for Med Chi's 192nd Annual Meeting on May 9-11, 1990 at the Turf Valley Hotel and Country Club in Ellicott City. "The 1990's: What Can We Expect?" is the theme for this meeting featuring several noteworthy speakers including plenary speaker AMA Trustee Lonnie Bristow MD, Physician Payment Review Commissioner Thomas Reardon MD and Victor A. McKusick MD, Professor of Medical Genetics from The Johns Hopkins School of Medicine. The meeting also will include technical exhibits as well as scientific sessions that will fulfill Category I CME credits. To preregister, physicians should complete and mail in the form on page 19 of the preliminary program mailed with the March issue of the *MMJ*. To request additional preregistration forms contact Med Chi's Education and Meetings Management Department at 1-800-492-1056 or 539-0872 in Baltimore.

Health Access America

In March Med Chi announced its support of the AMA's Health Access America, a proposal to improve access to affordable, quality health care for all Americans. The proposal, which accentuates the strengths of our medical care system, attempts to correct the problem of over 33 million Americans who lack health insurance coverage and cannot afford the cost of medical treatment. President Raymond M. Atkins MD said that Med Chi physicians are involved in several regional programs that support "Health Access America," such as Allegany Health Right Program in western Maryland. The proposal contains 16 points designed to correct our medical system's weaknesses by controlling healthcare cost increases, reforming Medicare and Medicaid, and insuring all Americans access to affordable health care. The proposal also will initiate further tort reform, establish state level risk pools for individuals who cannot afford insurance, and formulate practice parameters for physicians. Herman C. Maganzini MD, Chairman of Med Chi's Public Health Committee, will be the coordinator for this effort in Maryland. For more information on "Health Access America" contact Med Chi's Public Relations Department at 1-800-492-1056 or 539-0872 in Baltimore.

1990 Medicare Changes

In March physicians should have received a "Dear Doctor" letter identifying the many Medicare reimbursement and policy changes that will occur this year. Medicare has given physicians a March 31, 1990 deadline to change their participation status for the period April 1 through December 31, 1990. No action is required for physicians who retain their current status.

The "Dear Doctor" letter outlines a timetable of several key Medicare changes that will be in effect:

Effective April 1, 1990:

Medicare fees will be updated for 1990 and changes in physicians participating status will become effective.

Physicians who accept assignment for Medicare patients must accept assignment for Medicare patients who are also eligible for Medicaid benefits.

Unassigned claims that fail to include ICD-9 codes will be referred to the Health and Human Services (HHS) Inspector General for possible sanctions.

Effective May 1, 1990:
Assigned claims that do not include Medicare carrier identification numbers of the performing physician will be rejected.

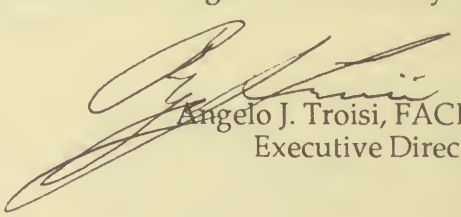
Effective July 1, 1990:
Assigned claims will be denied if ICD-9 codes are incomplete or inaccurate. Unassigned claims will be referred to the HHS Inspector General for failure to submit complete or accurate ICD-9 codes.

Effective September 1, 1990:
Physicians must submit all Medicare claims to carriers regardless of the assignment decision.

Medicare carriers will initiate a congressional mandate to profile individual physicians whose practice patterns vary significantly from peer group norms. This activity is not punitive but rather an educational effort to advise physicians of practice variations.

For questions regarding the 1990 changes in Medicare, physicians should contact carriers for their area. In Prince George's and Montgomery County, contact Pennsylvania Blue Shield at 717-763-5700. All other physicians should contact Maryland Blue Cross/Blue Shield Provider Relations at 301-561-4057 or 301-561-4058.

Hepatitis C Blood Collection Testing



The American Red Cross announced recently that blood collection agencies will implement antibody testing for Hepatitis C (anti-HCV) in early April or as soon as licensed test kits become available. Hepatitis C virus appears to be the cause of the majority of non-A, non-B hepatitis. Once testing proficiency is established, the Red Cross will begin to replace hospital inventories with anti-HCV tested units.

CPR Study

The Maryland State Board of Education passed a resolution in 1982 encouraging students at the high school level to take part in learning CPR. In an effort to add early cardiac care to this CPR program a follow-up study was completed recently. Med Chi thanks Raymond D. Bahr MD, Medical Director for the Paul Dudley White Cornorary Care System and President of the Maryland Society of Cardiology, for his efforts in that study.

Ethical Obligation

Physicians are reminded that it is not inherently unethical for a physician to own, or own an interest in, a hospital, clinic, or other health care facility. However, sending a patient to such a facility soley for the physician's financial benefit is unethical. If you have a financial interest in any medical facility, you have an ethical obligation to inform your patients.

Angelo J. Troisi, FACHE
Executive Director

The President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to its members

Medical
and Chirurgical Faculty
of Maryland

April 1990

February was an exciting and very productive month for the Faculty. Our efforts helped to improve communication by bringing more news and information to the membership through meetings held throughout the state.

Frederick County Medical Society Meeting

On February 20, Med Chi representatives, including myself, Executive Director Angelo Troisi and Lobbyist Gerry Evans, and attended the Frederick County Medical Society's monthly meeting. Officers and members were presented with an overview of events and projects concerning the Faculty including an update on the Triplicate Prescription and Mandated Medicare Assignment issues. Frederick County President-Elect Henry P. Laughlin MD's efforts in developing and hosting the meeting were sincerely appreciated.

Legislative Rally in Annapolis

On February 21, more than 150 physicians showed their support for organized medicine by attending the Med Chi rally in Annapolis. The strong turnout demonstrated to our representatives that physicians solidly support any effort to prevent further government regulation of medicine. During the assembly, I stressed the importance of physician unity. Lobbyist Gerry Evans urged physicians to oppose House Bill 617 on Mandated Medicare Assignment and House Bill 1248 on the Health Services Cost Review Commission's proposal to regulate anesthesiologist, radiologist, and pathologist services to their definition of "hospital services." Among the legislators speaking at the rally were House Speaker Clayton Mitchell and Senate President Michael Miller. Following the assembly, physicians adjourned to their local representatives offices to discuss medicine's concerns. On behalf of the Faculty, I would like to thank all the members who attended the rally and all the component society officers and executives who made this rally an outstanding success.

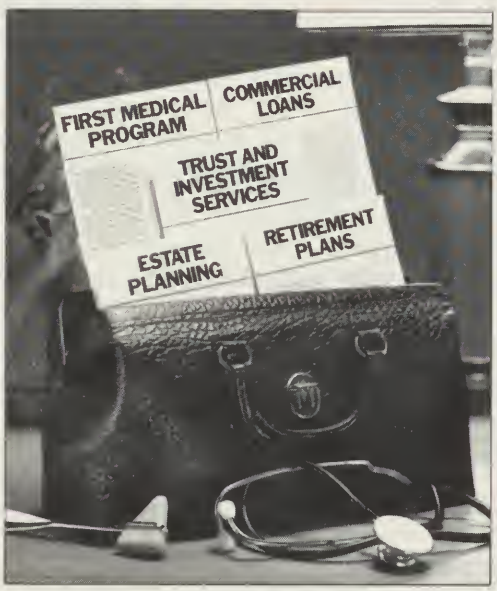
Southern Regional Conference

On February 22, Approximately 100 Med Chi members from Calvert, Charles, and St. Mary's Counties attended the Southern Regional Conference to hear updates on Med Chi policies and planning, upcoming legislation, and general news. Medical Mutual CEO Raymond M. Yow MD spoke on reductions in

liability insurance premiums brought about by Med Chi's persistent efforts to initiate further tort reform. Following the discussion, featured speaker Paul M. Fischer MD from the Medical College of Georgia spoke on the "Physician's Office Laboratory." Dr. Guillermo Sanchez's efforts in hosting the meeting are highly commended.

AMA Leadership Conference

On February 23, Executive Director Angelo Troisi and I attended the AMA National Leadership Conference in Phoenix, Arizona. "Strengthening the U.S. Health Care System" was the theme of this meeting that included seminars focusing on issues such as "Rationing Care" and "Understanding Our National Health Care Priorities." Maryland's Wayne C. Spiggle MD from the Allegany Health Right Program was featured in a seminar entitled "Bridging the Gap." The program was designed to present model programs demonstrating ways the medical profession can regain the public's trust. Allegany County's Health Right program for grey-area patients who do not qualify for government aid and cannot afford health insurance is an ideal example of a program that epitomizes the attitude inherent in physicians: to strengthen the doctor/patient relationship.



In the coming months, look for articles in the *Maryland Medical Journal* on the various social, economic, and legislative changes outlined at the AMA's National Leadership Conference on February 23-26.

I would like to extend my appreciation to all those hardworking members who participated in this month's important activities. It is my hope that by continuing to focus on improved communication to all physicians in Maryland, Med Chi will best serve the needs of its membership.

Raymond M. Atkins MD
President

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Maryland Center for the Treatment of Impotence

featuring the ErecAid System

The ErecAid System is a simple, safe and effective treatment for impotence without the risks and expense of surgery or drugs. It is useful for the treatment of impotence due to the following:

- Diabetes
- Hypertension
- Spinal Cord Injury
- Implant Protheses Reversal
- Medication Reaction
- Prostate Surgery
- Vascular Disease
- Multiple Schlerosis
- Psychogenic Factors

For the treatment of impotence

100 Years of Research Advances: The Johns Hopkins Hospital and School of Medicine

Simeon Margolis MD, PhD

Dr. Margolis is Associate Dean for Academic Affairs, The Johns Hopkins University School of Medicine.

When The Johns Hopkins Hospital opened a century ago, the president of the Johns Hopkins University, Daniel Coit Gilman, cautiously listed the accomplishments he envisioned for twentieth century medicine. Among them were the "disappearance of epidemics, fewer days of confinement in sickness, fewer minor ailments, a decrease of infantile mortality, greater powers of resistance to the evils of certain occupations, and comparative immunity from many infirmities which are now common, artificial reinforcements and replacements of bodily defects, simpler and surer means of diagnosis [and] the detection of the nature, origin, and history of specific disorders."

The collection of articles in this special issue of the *Maryland Medical Journal*, which recognizes the Centennial of The Johns Hopkins Hospital and School of Medicine, report research advances from Hopkins scientists that both fulfill and challenge Gilman's expectations, as well as our own.

For example, the AIDS epidemic, surely the most ferocious of modern times, threatens the public health; and Hopkins scientists Chaisson and Smith, authors of the article on page 365 are among those at Hopkins seeking control of HIV infection through research, prevention, and clinical care.

A number of articles address Gilman's desires for shorter hospital stays, increased wellness, less infant mortality, and preventive medicine. Particularly note Diwan's paper on laser therapy in the treatment of congenital vascular abnormalities (page 343), Dover's on the management of sickle cell anemia (page 371), and Guerci's on thrombolytic therapy (page 377).

Yeager's article (page 337) on prospects for bone marrow transplants in genetic deficiency diseases speaks to Gilman's hopes for "replacements of bodily defects" as surely as have advances in large organ transplantation, prosthetics, and reconstructive surgery.

As for the search for "simpler and surer" means of diagnosis and natural history and molecular origins of disease, the articles by Blakemore (page 325) on prenatal diagnosis and by Rovner, Folstein, and Meyer on Alzheimer's disease (page 399) carry on a commitment to the mission of research in service to patients set forth by Gilman, Billings, Welch, Halsted, Kelly, Osler, and others who populated Hopkins' labs and wards so many years ago.

The selected reports in this issue show the present generation of physicians and scientists are continuing the Hopkins tradition. We chose topics we believe are of interest and use to physicians and readers of *MMJ* as well as of value in the care of patients. Time will reveal whether our version of Gilman's vision will bring more health and well-being to our patients, the people of the state of Maryland, and the larger world population. But as these articles suggest, we are marking the times well. ■

MRI UPDATE

Figure 1

Figure 2

Figure 3

CLINICAL INFORMATION: This is a 69-year-old male who is unable to abduct his right arm and who has difficulty extending his arm. This is associated with right shoulder pain.

FINDINGS: Figure 1 is a proton density image in the coronal plane of the right shoulder. There is degenerative hypertrophy of the right acromioclavicular joint with a prominent inferior projecting osteophyte (A). A roughly linear area of low signal intensity inferior to the right distal clavicle represents the medial aspect of the rotator cuff (labeled B). A thin linear structure of low signal intensity superior to the right humeral head (labeled C) represents the lateral portion of the rotator cuff. Figure 2 is a T2-weighted image again demonstrating the inferior projecting osteophyte from the acromioclavicular joint (A) and the components of the torn rotator cuff (labeled B and C) as previously described. Increased signal intensity material between the torn portions of the rotator cuff represents joint fluid lying both within the joint space and in the subacromial bursa. Image #3 is a partial flip angle image which is sensitive for T2-weighting. This exhibits increased signal intensity in the immediate region of the rotator cuff tear as well as extending lateral over the right humeral head. The level of this slice is slightly anterior to figures 1 and 2 and the increased signal intensity material represents joint fluid extending over the right humeral head into the subdeltoid bursa.

The MR images demonstrate complete disruption of the rotator cuff which may be due to an acute injury or possibly due to chronic entrapment of the rotator cuff by the degenerated right acromioclavicular joint.

COMMENT: MR imaging is the only modality capable of directly visualizing and differentiating the various soft tissue components of the musculoskeletal system. Only CT arthrography approaches this degree of accuracy in the detection of rotator cuff tears, however CT arthrography like its cousin, routine shoulder arthrography, is invasive and requires injection of contrast into the shoulder joint. MR is the imaging modality of choice in the initial evaluation of soft tissue injuries of the shoulder joint with routine or CT arthrography reserved for those patients on whom the MR study was indeterminate.

Maryland Magnetic Imaging
900 Toll House Avenue / Frederick, MD 21701
(301) 662-0077

Health Images facilities operate their MRI systems with all available upgrades including contiguous thin slices, high resolution head and body coils, state of the art surface coils, and cardiac gating.

Health Images facilities are a community resource available to all area physicians.

Prenatal Diagnosis: Historical and Futuristic Perspectives

Karin J. Blakemore MD

Dr. Blakemore is Assistant Professor, Gynecology and Obstetrics, The Johns Hopkins University School of Medicine.

Prenatal diagnosis is a rapidly expanding field, as the latest advances in human genetics continue to embrace the newer technologies in gynecology and obstetrics.

The impressive expansion of prenatal diagnosis services to couples at risk for genetic disease in their offspring is a direct corollary of the explosion of information that has occurred over this same period in the field of human genetics. Simultaneously, major milestones have been achieved in obstetrics and gynecology, enabling the development of a variety of new obstetrical techniques for this exciting work.

The Tay-Sachs screening program, which began in Baltimore in the early 1970s through the Kennedy Institute and Johns Hopkins Hospital, led to the identification of couples at risk who could then be offered a prenatal diagnostic test. Screening programs such as this are vitally important, since patients can be offered diagnosis before the birth of an affected child. Most families at risk for an inborn error of metabolism are identified through the birth of a child with the disease because no screening test is yet available. One exception is the hemoglobinopathies (sickle cell anemia and the thalassemias) in which, like Tay-Sachs, the ethnic background of the couple prompts a simple blood-screening test.

The most commonly used screening test is the pregnant woman's age, given the increased risk of fetal cytogenetic abnormalities as mothers get older. All women who will be 35 or older at delivery should be offered genetic counseling for the risk of a chromosomal abnormality in their offspring. Today, many women in their early 30s also request prenatal diagnosis for cytogenetic study.

Maternal serum alpha-fetoprotein (AFP) screening is now offered to all pregnant women. The test was developed in the United Kingdom,[1] where the incidence of neural tube defects is relatively high. Elevations of this fetal protein in the mother's blood can detect 80 to 85 percent of open neural tube defects (spina bifida and anencephaly). It also may detect ventral wall defects, such as omphalocele or gastroschisis. The test has a high false-positive rate, since less than 5 percent of fetuses in women with a serum elevation actually have such birth defects. Further testing, including a careful ultrasound examination of the fetus and amniocentesis, are used to rule out these anomalies. Testing the amniotic

fluid concentrations of AFP, as well as of acetylcholinesterase, has a much lower false-positive rate, and detects 98 percent of neural tube defects. Many couples who have given birth to an affected child opt for amniocentesis for AFP determination in future pregnancies.

Low maternal serum AFP levels are now known to be associated with autosomal trisomies (trisomy 21 and trisomy 18). Factoring in the maternal age, many laboratories, including most of those in Maryland, provide the obstetrician with an AFP-adjusted risk of Down syndrome, and if that figure is equal to or greater than the risk of Down syndrome in a 35-year-old woman, amniocentesis can be offered to the patient for cytogenetic analysis. In the near future, two additional maternal screening tests for Down syndrome should become available, human chorionic gonadotropin, which tends to be elevated in the blood of the pregnant woman carrying a Down syndrome fetus, and estriol, which, like AFP, tends to be low. The combination of the four screens (maternal age, AFP, human chorionic gonadotropin, and estriol) appears in preliminary trials to be capable of detecting approximately two thirds of Down syndrome fetuses.

The first disorder credited to prenatal diagnosis really is a genetic disease, Rh incompatibility. Amniocentesis on Rh-sensitized women for the detection of bilirubin in Rh-positive fetuses was first used in 1950.[2] The resulting anemia from red cell breakdown in Rh-affected fetuses was also the first disease process in which *in utero* therapy was successful. The technique of amniocentesis for the diagnosis of Rh disease found applicability in the prenatal diagnosis of a great many genetic disorders and birth defects. Today fetal umbilical cord blood sampling for antenatal diagnosis of certain genetic disorders has become a powerful tool in the management of the Rh-sensitized pregnancy.

Current Diagnostic Techniques

Four techniques are used to gain access to samples that accurately reflect the fetus: amniocentesis, fetal blood sampling, chorionic villus sampling, and fetal skin biopsy. Intimately related to the evolution of all four is the development of diagnostic ultrasound imaging.

Sonography has become a powerful tool in the obstetrician's and geneticist's repertory. Real-time sonography, developed in the mid to late 1970s, permitted more than a frozen image of the wonders within the uterus. Like a movie, continuous images are shown on the screen at a rate of 15 frames per second or greater. Modern equipment can achieve frame rates on the order of 40 per second. High-resolution ultrasound in the early 1980s sharpened the view even more with electronic focusing of the sound beam. Today's equipment allows for imaging that can precisely guide a needle into the tiny umbilical vessel of an 18-week fetus. Ultrasound guidance clearly has improved the safety of amniocentesis, enabling localization of the placenta (as well as of the fetus). The availability of ultrasound was essential to the development of the other prenatal diagnostic techniques as well.

High resolution ultrasound has largely replaced fetoscopy as a method of visualizing fetal anatomy. Fetoscopy is performed using 1.7 mm diameter endoscopes within cannulae 2.0 mm or greater. Even with the smallest cannula, fetoscopy is associated with fetal loss rates of 1 to 5 percent.

Sonographic visualization of fetal anatomy has become a science unto itself.[3] Many, though not all, major birth defects can be visualized between 16 and 20 weeks' gestation. In many European centers an obstetrical sonogram routinely is performed in the mid-second trimester of all pregnancies for dating purposes as well as for a fetal anatomy screen. Many couples who have had a child with a major birth defect can be reassured by a normal sonogram in subsequent pregnancies. Some genetic syndromes (those featuring a sonographically detectable anomaly) can be evaluated using ultrasound in at-risk pregnancies. Fetal echocardiography is offered at a number of medical centers (including Hopkins) for a variety of indications. By focusing on the fetal heart at 18 weeks of gestation or greater, well over 90 percent of serious cardiac structural anomalies as well as arrhythmias can be detected.

As in all aspects of prenatal diagnosis, attempts to move the time of detection to earlier and earlier gestational ages have been under way in the arena of ultrasound. New transvaginal ultrasound transducers permit a closer look at the developing fetus in the first trimester, when the uterus is still relatively distant from a transabdominal approach. Some of the larger birth defects are detectable at eight weeks using a transvaginal approach, and the detection of embryonic viability via fetal heart motion can be demonstrated clearly by six menstrual weeks. In general, the embryonic structures of early gestation can be visualized about one week earlier with transvaginal scanning as compared to transabdominal.[4]

Amniocentesis

Amniocentesis is still the gold standard against which other prenatal diagnostic techniques are compared. Still the most widely used procedure, an amniotic fluid sample provides a source of fetal cells as well as a supernatant for biochemical markers. The most common indication for genetic referral by obstetricians is maternal age, and most of the amniocentesis performed today uses amniotic fluid *cells* some of which are viable and can be grown and harvested for cytogenetic analysis. In the initial efforts at chromosomal analysis from cultured amniocytes[5] cell growth was poor and relatively slow. The time to results has shortened over the years from four to five weeks to as little as seven or eight days, using *in situ* techniques. Instead of collecting all the growing cells from the bottom of a flask into a test tube, the techni-

que currently performed in the Prenatal Cytogenetic Laboratory at Johns Hopkins allows the cells to be grown *and* harvested directly on small glass coverslips. Under the microscope, cells from individual colonies can be analyzed, seen as they were when growing. This technique has yielded a considerable savings in time to harvest.

Cells representing the fetus also can be used for molecular (DNA) analysis or biochemical analysis. Cultured amniocytes were first used for prenatal molecular diagnosis for the detection of sickle cell disease in 1976.[6] The ability to expand the portion of the genome of interest using the newly developed polymerase chain reaction (PCR) techniques demonstrates yet another breakthrough in prenatal diagnosis. Amniocytes need not be cultured, since enough cells are available from the fresh amniotic fluid sample to undergo DNA extraction and PCR, saving weeks of culture time. This method is useful only for disorders in which a known gene can be amplified, that is, a sequenced gene primer must exist before PCR can be performed, but the technique is being applied at Johns Hopkins in the prenatal diagnosis of hemoglobinopathies.[7]

The majority of inherited biochemical disorders may be successfully diagnosed prenatally because there is a known metabolic by-product or biochemical marker to examine. These include the lysosomal storage diseases, amino acid disorders, and many other inborn errors of metabolism. Sometimes the marker is studied in amniotic fluid supernatant; more often, viable cells are required for the biochemical assay. Until 1983, cultured amniocytes were the only source of viable cells reflective of the fetus for these assays. Since the advent of chorionic villus sampling, however, most (though not all) of this group of genetic disorders can be ascertained through *uncultured* (fresh or frozen) villus fragments. This saves weeks of anxious waiting for at-risk couples, since the time required for cell culture is eliminated. Cultured villus cells also frequently are used, amenable as they are to the established laboratory assays that have been worked out for cultured amniocytes.[8] Some disorders, like osteogenesis imperfecta due to a defect in collagen formation, show expression of the defect in cultured chorionic villi (or fetal skin), but not in cultured amniocytes.

Despite a rather vast experience with amniocentesis, its procedure-related risk of miscarriage is not clear. Amniocentesis today is performed using real-time ultrasound guidance, and one would think that older risk figures might be modified in light of the enhanced safety that sonographic visualization provides. In the US collaborative study, published in 1976,[9] no statistically significant difference in fetal loss rates was found between the amniocentesis group and controls (3.5 percent and 3.2 percent, respectively). Only 29 percent of the cases had sonographic localization of the placenta prior to amniocentesis. A more recent study from the Netherlands[10] reported a 1 percent procedure-related loss rate for ultrasound-guided amniocentesis; this study was well designed, and the data cannot be ignored: it corroborates the 1978 figures generated by the United Kingdom Medical Research Council on the hazards of amniocentesis,[11] yet not all patients in the British study underwent sonography.

Early amniocentesis, even as early as 10 gestational weeks, is undergoing trials for safety and accuracy. Attention is being given to the detectability of alpha-fetoprotein and acetylcholinesterase in first trimester amniotic fluid specimens, as well as to the speed of cytogenetic laboratory results from these earlier samples. Continuous ultrasound guidance is essential; without it this new approach would not have been conceived.

Fetal Blood Sampling

Fetal blood sampling was a fairly hazardous procedure when first attempted via placental fetal vessel puncture in the early 1970s. Fetal loss rates declined to between 1 and 5 percent with the advent of fetoscopy, using scopes housed in 2.0-3.0 mm cannulae with a Y-sided arm.[12] The most common indication for fetoscopic blood sampling was beta-thalassemia. In the early 1970s it became apparent that beta-globin was synthesized by fetal red blood cells early in human gestation[13] raising the possibility of *in utero* diagnosis of beta-thalassemia if a safe method of fetal blood sampling became available. Fetoscopy answered that need,[12] and beta-thalassemia soon entered the ranks of prenatally diagnosable genetic diseases.[14]

With the developments in the molecular analysis of beta-thalassemia,[15] first with linked DNA polymorphisms and later direct detection of the mutation(s) involved in beta-thalassemia, fetal blood sampling no longer became necessary. DNA reflecting the fetal status could be obtained by the alternative and less formidable techniques of amniocentesis or chorionic villus sampling.

While fetoscopic blood sampling for hemoglobinopathies rapidly gave way to molecular diagnosis, a safer method of obtaining a fetal blood sample was being developed.[16] Ultrasound-guided needle puncture of an umbilical cord vessel (cordocentesis) quickly replaced the fetoscopic technique during the mid-1980s. Usually performed with a 20 or 22 gauge needle, fetal loss estimates for cordocentesis vary from as low as 1 in 600 to 2 percent.

The most common reason for fetal blood sampling is for rapid fetal karyotype; cytogenetic results are available in three days and sometimes 48 hours. Other cytogenetic indications include the fragile X syndrome and study of chromosomal mosaicism. When an amniocentesis is precluded by marked oligohydramnios, cordocentesis provides an alternative means of obtaining fetal cells. The management of Rh and other blood group isoimmunizations has improved, especially in severely affected cases, with cordocentesis. The fetus's blood type and actual hematocrit can be obtained.

Blood transfusions are performed via this same technique into the fetal vascular system as an alternative to the fetal peritoneal cavity. Largely due to the development of ultrasound-guided cordocentesis, there is a significant increase in survival rates for hydropic and/or severely anemic fetuses, particularly those who manifest severe hemolytic disease before 26 weeks' gestation.

Other uses of fetal blood sampling in prenatal diagnosis include severe combined immunodeficiencies, chronic granulomatous disease, and congenital infections. For some immunodeficiency states, the search for a bone marrow donor can begin long before birth with the concomitant use of prenatal human leukocyte antigen (HLA) typing of the affected fetus. Fetal treatment and prevention of congenital toxoplasmosis via maternal pharmacologic agents is being undertaken based on fetal blood results. Indeed, relatively easy access to the fetal circulation should find future applications in pharmacologic therapy directly to the fetus.

Chorionic Villus Sampling

Chorionic villus sampling, a new prenatal diagnostic technique, allows an earlier and more rapid result than does amniocentesis.[17] Ultrasound guidance was a prerequisite to the development of a safe sampling method. The placenta, composed of chorionic villi, genetically reflects the conceptus, not the mother. The original biopsies of the early placentas had been attempted in Scandinavia in the late 1960s using hysteroscopes that were 5 and 6 mm in diameter. High miscarriage rates and the simultaneous development of amniocentesis precluded further developments in placental biopsy in Europe for the next decade. The idea of a safe first-trimester option for patients became a reality in the early 1980s, with Italian and British investigators developing a transcervical ultrasound guided catheter method of aspirating small villous samples. The French used ultrasound-guided forceps. In the spring of 1983 as attempts in the United States were getting under way, a letter to the editor from a group in Milan appeared in the *Lancet* describing the diagnosis of trisomy 21 at 11 weeks gestation just 5 hours after chorionic villus sampling.[18] This was received with great excitement by colleagues in the field.

Because the early placenta is so mitotically active, Simoni working in Milan reasoned that there might be enough cells in metaphase to accomplish cytogenetic analysis without prior cell culture. He succeeded, and his method, so-called direct cytogenetic analysis, is used by numerous laboratories around the world with few modifications. It provides a rapid result with little risk of maternal contamination, although the chromosomal morphology is poorer than with cultured cell analysis. As the technique spread, it became apparent that the placenta of human conception might tolerate a cytogenetically abnormal cell line not present in the fetus itself. This phenomenon of mosaicism confined to the placenta is seen in about 1 percent of chorionic villus specimens, more often on direct preparations than in culture. Most laboratories today are turning to short-term cultures of chorionic villi either solely or as a backup to the direct cytogenetic analysis. Amniocentesis is recommended if questions remain concerning the possibility of a cytogenetically abnormal cell line in the fetus; in the vast majority of instances, the amniotic fluid cell analysis is normal.

The risks of chorionic villus sampling must be analyzed in light of the relatively high background miscarriage rate in the first trimester of pregnancy. Maternal age factors into this: older women have higher rates of spontaneous abortion and the vast majority of patients undergoing the procedure for cytogenetic analysis do so because they are older. The NIH Collaborative Trial, published in 1988,[19] found no statistically significant difference in fetal loss rates comparing women undergoing chorionic villus sampling to those having mid-trimester amniocentesis. Current estimates of the procedure-related risk of chorionic villus sampling are generally quoted at 1/200 to 1 percent. Increasingly, a transabdominal approach to chorionic villus sampling is undertaken using ultrasound-guided needle aspiration, with similar pregnancy loss rates. Chorionic villus sampling can also be performed in the second or third trimester of pregnancy using a transabdominal technique.

Our understanding of human disease at the molecular level has progressed at an astonishing rate in the past decade.[20] Chorionic villus sampling was immediately adapted to these exciting new developments, permitting first trimester prenatal diagnosis of many disorders hardly imaginable a few years earlier. In fact, most of the diagnoses currently possible using amniotic fluid cells have been adapted to chorionic villi. Many laboratory methods, moreover, can be applied to fresh or frozen villus fragments without the time-consuming cell culture. DNA can be extracted directly from the villi, and a preliminary result for biochemical disorders is often available within days (or even hours for Tay-Sachs disease, for example) of the procedure. Laboratories such as Haig Kazazian's and the Mosers' at Johns Hopkins Hospital and the Kennedy Institute were among the first to adapt their methods to chorionic villi, receiving villus samples from around the world from pregnancies at-risk for a variety of serious genetic disorders, such as hemoglobinopathies, hemophilia A and B, and adrenoleukodystrophy.

Fetal Skin Biopsy

Fetal skin biopsy is yet another prenatal diagnostic technique, although it is much less frequently requested than are other methods. It was developed for two main indications: the genetic dermatoses and to further evaluate possible chromosomal mosaicism in

the fetus. The minute skin biopsies are large enough to be studied microscopically for fetal skin disorders and can be expanded in culture for cytogenetic analysis. Fetoscopically derived fetal skin biopsy, with the same 1 to 5 percent risk that applies to other procedures using the fetoscope, probably will be replaced by an ultrasound-guided technique. Trocars housing a biopsy forceps with diameters on the order of 1.5 mm are being investigated at Hopkins and other centers.

Toward the Future

There are, a whole host of recognized genetic disorders for which there is yet no understanding of their molecular or biochemical basis.[21] For some milder disorders, prenatal diagnosis may not be of much interest. For others, the ability to provide an antenatal diagnosis will be clinically very important, opening a door to couples who might otherwise fear conceiving an affected child. Just as for the list of genetic diseases now amenable to antenatal diagnosis, history surely will repeat itself for those we still find perplexing. Prenatal diagnosis will continue to tread on the heels of discoveries concerning the pathogenesis of disease.

We look toward expanding the treatment of genetic disease *in utero*. Initially this may be by stem cell transfer or yet-untried therapeutic regimens via the mother. Efforts will be forthcoming in the field of gene transfer to push the timing of such therapy to earlier and earlier stages of fetal and embryonic development. As advances in human genetics embrace the latest technologies of reproductive medicine, preimplantation and even preconceptual prenatal diagnosis and therapy may become a reality.

Announcing a cure for the common computer.

Is your practice computer system chronically ill? Or perhaps you're just not getting access to the information you need? At MEDSOURCE, we have the expertise to diagnose and treat your data problems. Whether it's analyzing data for negotiation with HMOs, coordinating clinical research projects or tracking patient care, MEDSOURCE can provide you with healthy, accurate data every time.

We can assist you in the selection of medical record and accounting systems. We'll install new equipment and train your staff. We can even develop customized programs to help you make new use of existing data.

MEDSOURCE's 13 years of experience in computer programming and our in-depth knowledge of the clinical health care field make us the expert in computer systems for practice management. So, the next time you find yourself diagnosing your computer instead of your patients, call MEDSOURCE.

Current Technology of *in vitro* Fertilization and Embryo Transfer

Marian D. Damewood MD

Dr. Damewood is an Assistant Professor, Department of Gynecology and Obstetrics, Division of Reproductive Endocrinology; and Director, In Vitro Fertilization Program, The Johns Hopkins University School of Medicine.

Since the initial human in vitro fertilization (IVF-ET) procedure in 1978, the laparoscope was the primary method for oocyte collection. Although laparoscopic retrieval instrumentation has been refined, ultrasound-guided follicular puncture has become the major retrieval technique in IVF-ET repertoire. The Johns Hopkins In Vitro Fertilization Program was initiated in 1984, recording the first in vitro pregnancy in Maryland.

The first successful *in vitro* fertilization (IVF-ET) pregnancy was achieved in 1978 by Steptoe and Edwards with aspiration of one oocyte obtained from a spontaneous natural cycle.[1] Laparoscopic oocyte retrieval techniques were used, with transfer of one cleaving embryo. Since that time much effort has been directed toward development of optimal stimulatory agents in order to produce mature oocytes: follicular stimulation techniques have produced multiple oocytes and thus more cleaving embryos. The larger number of cleaving embryos was an impetus to the development of the methodology of human embryo cryopreservation. In addition, ovulation induction regimens and oocyte retrieval techniques from IVF-ET were employed in the recently developed gamete intrafallopian transfer (GIFT) procedure. Pregnancy success of *in vitro* fertilization cycles appears to increase with the number of embryos transferred with an overall rate of 15 to 25 percent per cycle in world centers. The new methodologies and refinements in existing techniques introduced within the past three years may increase the number of cleaving embryos and thus increase the pregnancy rate per patient attempt.[2]

Selection of Patients

The major indication for IVF-ET is failure of conventional medical or surgical therapy to reverse infertility. The classic indication for IVF-ET (previous salpingectomy or salpingectomies for ectopic pregnancy) has been joined by other indications: failed reconstructive tubal surgery, lysis of adhesions, or cornual and distal tubal obstruction. Other infertility problems, such as endometriosis refractory to hormonal and surgical therapy, also have been treated successfully with the IVF procedure. Tubal factors and endometriosis, along with the category of unexplained infertility, account for the majority of candidates for IVF-ET. Additional indications include severe cervical factor, oligospermia, and such immunologic factors as sperm antibodies in the man or woman. One IVF candidate may have multiple causes of infer-

tility, such as a combination of tubal disease and oligospermia. The causes of infertility and the IVF patients in The Johns Hopkins Hospital IVF program are summarized in the Table.

A screening laparoscopy may allow determination of ovarian accessibility prior to an IVF attempt in patients who have had pelvic adhesions. We at Johns Hopkins no longer perform a screening laparoscopy since the availability of operative laparoscopic techniques has allowed lysis of adhesions and ovarian mobilization to be performed concurrently with IVF. Ultrasound-directed oocyte retrieval does not require ovarian mobilization.

The assessment of patients for IVF-ET should include consideration of not only infertility factors but also general health, absence of contraindications to pregnancy, regularity of ovulation, luteal phase sufficiency, and absence of genital tract infections in husband and wife. Accessibility of the ovaries for oocyte recovery by either laparoscopy or ultrasound retrieval, and other variables including sperm count, motility, and morphology, also should be assessed. Our screening for IVF couples includes a complete andrology survey for the husband and a study of the wife's serum with a mouse embryo culture system. In addition, we require an interview with a psychological counselor and provide counseling for all couples prior to the IVF attempt.[3]

We have not completely excluded patients over the age of 40 from IVF procedures, even though they may be relatively infertile and may have a high spontaneous miscarriage rate. Each patient should be assessed individually with emphasis on normal uterine function, ovulation, and semen parameters.

Follicular Stimulation Techniques

The objective of ovarian stimulation is recruitment of a cohort of follicles in the time framework of the FSH (follicle-stimulating hormone) recruitment window which occurs between days 3 and 5 in a 28-day cycle. Clinical monitoring parameters of follicle growth such as serum estradiol assays, sequential real time ultrasound measurements of follicle diameter, and cervical mucus evaluation allow the determination of critically timed steps such as discontinuation of stimulatory agents, administration of human chorionic gonadotropin (hCG), and oocyte retrieval.

Table. Causes of Infertility in Patients in The Johns Hopkins Hospital IVF Program

Major Cause of Infertility	Percentage of total
Tubal disease	39.2
Endometriosis	25.8
Unexplained infertility	23.6
Oligospermia	6.2
Immunologic factors	3.1
Cervical factor	2.1

Follicular induction regimens in current use include clomiphene citrate (CC), human menopausal gonadotropin (HMG), pure FSH, and gonadotropin releasing horomone analog (GnRha).

CC in doses from 50-150 mg/day is administered for 5 days varying between days 3 and 7 of the cycle along with human chorionic gonadotropin, 5-10,000 International Units (IU), given according to estrogen response and ultrasound diameter of the dominant follicles. In 80 percent of clomiphene cycles for IVF-ET oocytes are obtained, with an average of 1.6 to 2.1 retrieved per cycle. Pregnancy rates with clomiphene cycles range from 11 to 20 percent, with a mean of 1.6 $\pm$ 0.2 embryos transferred.

Recent studies showed that clomiphene in doses of 50 or 150 mg do not differ in success rates for mature oocytes retrieved. However, an increase in the number of follicles recruited is seen with HMG supplementation of clomiphene regimens. Starting on day 6 or 7 of a clomiphene cycle, 1 to 4 ampules of HMG are added per day for a 3 to 4 day period. HMG also may be administered concurrently with clomiphene throughout the induction period. With these combination regimens, the number of oocytes obtained is 3 to 5.2 per cycle. Pregnancy rates range from 17 to 25 percent with 2.5 $\pm$ 0.3 embryos transferred.

Anticipating that the ovarian response may be more dependable than with clomiphene and that the antiestrogenic effects on cervical mucus and the endometrium may be avoided, pure HMG/hCG regimens were instituted. HMG administration in doses of 1 to 4 ampules per day beginning on day 3 of the cycle, results in 3.6 to 5.1 oocytes per cycle with pregnancy rates from 20 to 26 percent. The mean number of embryos transferred is 2.3 $\pm$ 0.3. the number of immature oocytes collected at laparoscopy however, is higher in HMG groups compared to clomiphene/HMG and clomiphene alone. In reviewing results from centers throughout the world, however, no statistical difference can be found in any of the stimulation regimens based on pregnancy rate alone at the present time.[4]

A greater understanding of the mechanisms of follicular and oocyte development and the intrafollicular environment is important in the efficiency of IVF-ET therapy. New gonadotropin preparations with a greater emphasis on pure FSH were applied to IVF-ET protocols. Pure FSH, with minimally detectable LH in the preparation, is capable of stimulating ovarian estradiol secretion at a level not dissimilar from that obtained by the same dose of a urinary HMG preparation containing an equal ratio of FSH to LH.[5] The elimination of the LH factor in the early portion of the follicular phase more closely simulates the natural cycle, allows a more homogeneous follicular response, and may produce oocytes of better quality than with a mixed preparation of gonadotropins.

Pure FSH has been used in the Johns Hopkins Program since 1987. Preliminary reports of pure FSH in IVF-ET programs showed pregnancy rates of 20 to 28

percent. A larger number of oocytes appear to be obtained (mean 5.3-8.1) perhaps reflecting events occurring in the FSH recruitment window. An additional effort to reduce the individual variability of follicular response to gonadotropin therapy is pretreatment with a Gonadotropin-releasing hormone (GnRH) agonist. In animal studies, administration of a GnRH agonist prior to pure FSH maintained a relatively hypogonadotropic state regarding endogenous gonadotropin secretion and increased homogeneity of ovarian estradiol secretion during therapy. Thus, by reducing the confounding problem of individual follicular variation in response to treatment with gonadotropins, a more uniform retrieval of oocytes may be achieved with GnRH agonist pretreatment, which may be applicable to the IVF-ET setting. GnRH analogs have been used in the Johns Hopkins Program since 1988, resulting in greater than 6 oocytes in most patients.

Oocyte Retrieval Techniques

Laparoscopic Oocyte Retrieval In 1970 Steptoe and Edwards first described the use of the laparoscope for oocyte aspiration, using a medium gauge needle of 1.2 mm internal diameter placed in the left lower quadrant of the abdomen 7 cm from the midline. Oocyte recovery rate with this technique was 32 percent Lopata, in 1974, using a 20 gauge aspirating needle with a 45° bevel on the end and a separate laparoscope, accessory trocar, and needle system, achieved an oocyte retrieval rate of 45 percent. These aspirations were performed at 200 mm of mercury vacuum pressure. Renou, in 1981 demonstrated that a teflon-lined needle system 23 cm in length with an internal diameter of 1.6 mm and external diameter of 2.1 mm resulted in an 80 to 100 percent egg recovery rate. With this system 100 mm of mercury negative pressure was adequate to obtain satisfactory aspirations.

Present day IVF-ET laparoscopic aspiration methodology includes a two-puncture system using an offset operating laparoscope containing an operating channel through which the operating needle is passed. A second puncture is performed for placement of a grasping forceps on the utero-ovarian ligament. Oocyte aspiration is accomplished by a single lumen needle (teflon lined or without teflon) ranging in size from 12 to 14 gauge with an internal diameter of 1.2 mm to 2.16 mm. In the Norfolk program a 12 gauge needle with a 2.16 mm internal diameter and a 45° bevel is used.[6] Of particular interest is the raised external band 5 mm from the most distal point of the needle tip that enables the operator to determine the depth of penetration of the needle into the follicle (Figure 1). Suction devices used once the needle is placed into the follicle are either a 50 cc syringe suction (which creates a negative pressure of approximately 200 mm of mercury) or a wall suction system adjusted to approximately 100 mm of negative pressure. With the two-puncture system, an egg recovery rate of 89 to 94 percent has been achieved. Other IVF teams use the operating laparoscope and a three-puncture technique with the operating channel of the laparoscope used for lysis of adhesions and/or ovarian mobilization. Recovery rates are between 85 and 90 percent using this technique.[4]

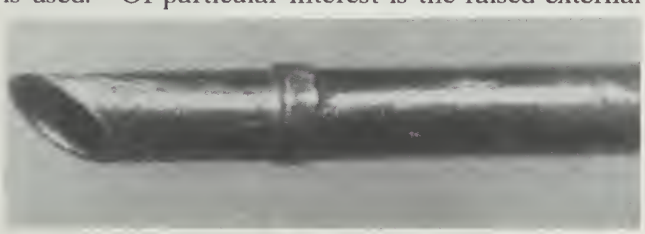

Figure 1. Needle with 45° bevel and elevated band used for laparscopec oocyte retriecal.

In addition, in The Johns Hopkins program, we offer operative laparoscopy to patients during the IVF procedure, using two- or three-puncture system. Lysis of adhesions, tubal and ovarian mobilization, and fulguration of ectopic endometrial tissue may be performed at the same time as the IVF attempt. This reparative surgery significantly increases conception rates over those for IVF alone. We have examined the rate of treatment independent pregnancies after IVF and reparative surgery, confirming the suspicion that the rate of spontaneous conception is increased.[7]

Ultrasound-Directed Follicular Puncture The major technique in use for IVF oocyte retrieval is ultrasonographically guided follicular puncture, which is especially useful when the ovaries are inaccessible to the laparoscope due to severe adhesive distortion.[8,9] Real-time ultrasonography and the modern sector scanner, adapted for use in oocyte retrievals, offer several advantages over laparoscopy, including use of local anesthesia and elimination of possible adverse effects on oocytes from the gas phase of CO_2 insufflation during laparoscopy.[10] In addition, patients more readily accept ultrasonographically guided retrieval than other techniques because it is noninvasive and may allow for more repeat attempts at IVF.

Ultrasonographically guided retrieval may be performed through a transvesical approach or through a relatively new transvaginal approach.[11] Using a transvaginal sector scanner, the latter precisely locates follicles with an exact needle-guided puncture line.

Transvaginal Puncture with Ultrasound Guidance Precise localization of follicles with an exact needle-guided puncture line may be achieved with the transvaginal sector scanner. The viewing capacity of this scanner is approximately a 240° angle. The needle guide is placed at an angle of 15° toward the scanner axis, and lines tracing the indicated direction of the needle in the sound field are fed into the scanner and are marked on the monitor by an electronic line (Figure 2). Follicular puncture with the vaginal scanner may be carried out with an empty bladder and appears to carry less risk than a freehand technique. Preliminary results from several centers report retrieval rates between 80 to 90 percent per follicle with this method. The possibility of infection of the culture medium from

a transvaginal route appears to be minimal. Ultrasound-directed vaginal retrieval has been used in The Johns Hopkins Program since 1988. At present 95 percent of patients have oocytes retrieved through this approach.

Laboratory Management and Embryo Transfer

Oocytes collected at operative or ultrasonographically guided retrieval are evaluated immediately in the laboratory for degree of maturity and morphology (Figure 3). Mature eggs are allowed to remain in the culture media for four to six hours and then inseminated with approximately 50,000 motile sperm per egg. Oocytes judged to be immature are incubated for approximately 18 to 24 hours and then inseminated. Inseminated oocytes are evaluated twice daily for evidence of fertilization, second polar body extrusion, pronuclear development, and cleavage. Fertilized and cleaving embryos are transferred to the patient 48 to 72 hours after retrieval (Figure 4). The embryos are transferred to the uterus through a small catheter inserted through the cervix.

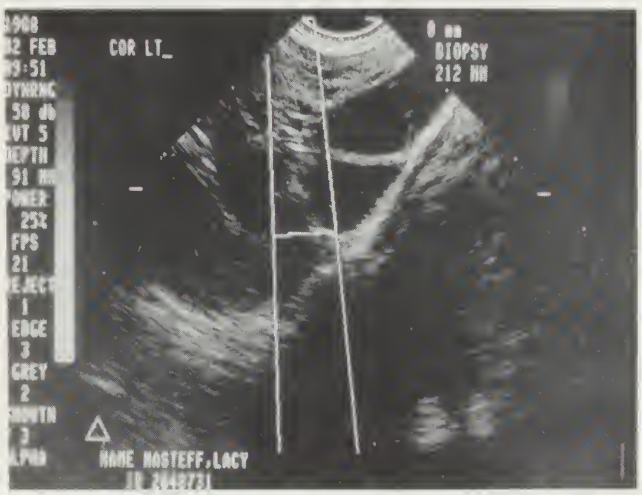

Figure 2. Ultrasound needle localization line with transvaginal sector scanner.

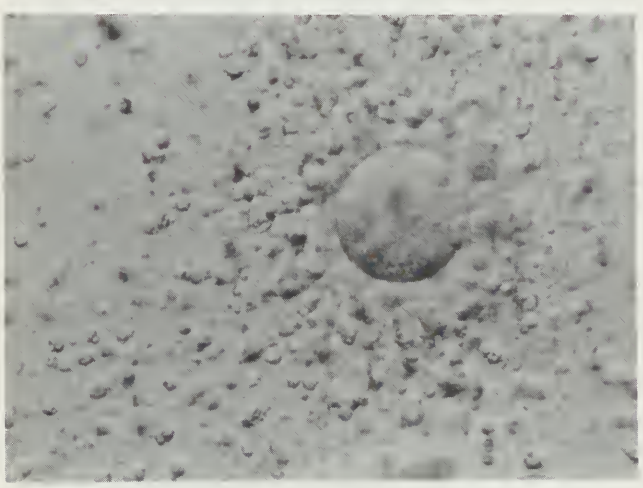

Figure 3. Mature human oocyte 15 minutes after aspiration.

Depending on the number of embryos transferred, pregnancy success rates per embryo transfer have ranged from 10 percent to 30 percent. The pregnancy rate is approximately 10 percent when one embryo is transferred, but with three to four cleaving embryos, rates are currently 26 percent to 30 percent per cycle.

New Techniques: Cryopreservation of Oocytes and Embryos

The use of follicle-stimulating agents to produce a large number of eggs for aspiration has raised a question: What should be done with the excess eggs or embryos? Options include[12]

- limiting the number of eggs recovered or inseminated
- transferring all embryos
- discarding eggs or embryos not used for transfer
- preserving eggs or embryos for future transfer

The latter possibility appears to be the most constructive. It offers the patient the advantage of embryo transfer at a later natural cycle. Successful pregnancies have resulted from transfer of cryopreserved and thawed embryos, with pregnancy rates ranging from 8 to 10 percent of patients who have had embryos frozen. The degree of embryo survival is associated with the cell stage at which the embryo is frozen; embryos at earlier stages of development (such as two cells) are more susceptible to damage by cryoprotectants and ice formation.[13,14] Cryopreservation is thus a reasonable answer to the question of what to do with excess oocytes and embryos obtained for IVF-ET. In addition attempts at other alternate forms of reproduction, including donor eggs and embryos, may be implemented.

Thus cryopreservation of eggs and embryos provides a reasonable solution to obtaining oocytes and embryos in excess of those desired for transfer during IVF. This process would overcome the difficulties in-

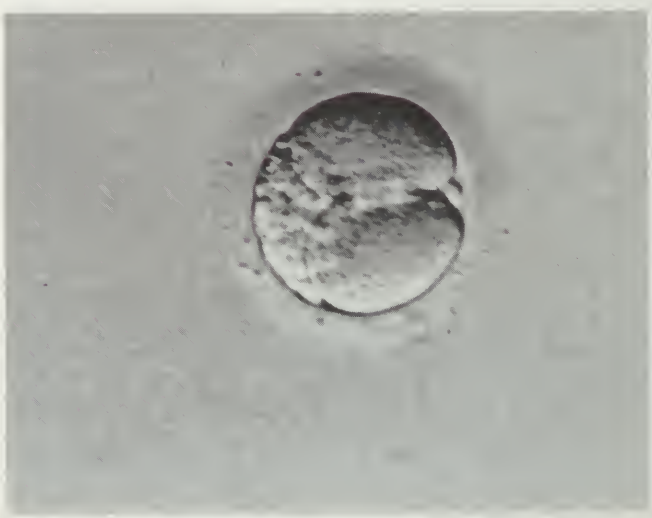

Figure 4. 2-cell human embryo prior to transfer.

volved in synchronizing donors and recipients in egg and embryo donor programs. Cryopreservation also may resolve the serious problems associated with oophorectomy and pelvic radiation or chemotherapy for patients desirous of preserving fertility.[15] It also raises the possibility of establishing a genetic diagnosis on a single blastomere, while leaving the remaining blastomeres of an embryo intact, at a stage when normal development will not be impaired by blastomere biopsy.

Success Rates and Pregnancy Outcome

The pregnancy rate per IVF attempt (15 to 25 percent) does not differ strikingly from that for each attempt at normal reproduction. If 100 couples were attempting pregnancy with unprotected intercourse in any one month of the year, only 25 of those couples would be expected to conceive. Factors as yet unknown may be involved in the selection process of gamete fertilization or implantation with one cycle of exposure. In addition, alteration of the uterine environment by the IVF follicular stimulation techniques may induce either a stage of endometrial advancement or luteal phase asynchrony, which may make embryo implantation difficult.

The risk of poor pregnancy outcome is only slightly higher in women who conceive through IVF-ET than in other women. The spontaneous miscarriage rate is approximately 30 percent per IVF cycle. This relatively high rate may be explained in part by the earlier detection of pregnancy in IVF patients.

The patient who conceives by IVF-ET is not considered to be at high risk unless she has some other obstetric risk factor. In many IVF programs including ours, the successful IVF patient may be managed by the referring obstetrician, who checks the progress of the pregnancy with ultrasonography as needed and refers the patient for amniocentesis if indicted for maternal age.

Certain patients are less likely to conceive through IVF than others: those with pelvic adhesions, limited ovarian function, multiple infertility factors, or advanced maternal age. The pregnancy rate in patients between the ages of 35 and 40 compares to that of patients 30 to 35 years of age, prompting research into aging as a factor in reproduction.

The GIFT Technique

Current methodologies of *in vitro* fertilization have fostered the development of a technique that may be an alternative to IVF-ET in cases in which tubal patency has been demonstrated.[16] Gamete Intrafallopian Transfer (GIFT) involves placement of both gametes (sperm and oocytes) into the fallopian tube through laparoscopy or minilaparotomy. Induction of follicular development is performed with an hMG/hCG regimen. Oocytes are obtained by laparoscopic follicular aspiration, and semen is prepared to yield a concentration of 100,000 washed sperm per microliter. On completion of follicular aspiration and oocyte inspection, the gametes are loaded into a catheter that is threaded into the aspirating needle. The needle is inserted into the operating channel of the laparoscope. The catheter tip is placed into the fimbriated end of the fallopian tube to a distance of approximately 1.5 cm, and the contents of the catheter are injected (Figure 5). The first GIFT procedure reported was successful, resulting in term twin females. The pregnancy rate at present is 35 percent. The GIFT technique may be a more physiologic approach than IVF since the ampullary region of the fallopian tube is the normal site of fertilization in the human.[17] Patients with unexplained infertility or mild endometriosis may be candidates for this procedure, since in these cases failure of spermatozoa to reach the tube may be the etiology of the infertility. A large series of studies of the GIFT procedure are in progress.

Alternate Forms of Reproduction

Basic IVF-ET is now accepted as a standard practice and can be used for the varied indications of intractable infertility. The concept of IVF has opened avenues of treatment for couples with a variety of previously uncorrectable problems such as absence of sperm, oocytes, or even the uterus or various combinations of these problems. Alternate avenues of IVF-ET include donation of sperm, oocytes, or embryos; cryopreservation of oocytes or embryos; or use of a surrogate uterus for gestation.

Many investigative observations of the interactions of the human sperm and oocyte and the early phases of human development have sprung from this technology; genetic analysis of the human blastomere, or blastomere biopsy, is one. This procedure presents unprecedented ethical dilemmas and responsibilities, but the information afforded by the study of human (rather than animal) cellular material may be most vital in the fields of genetic research and infertility.

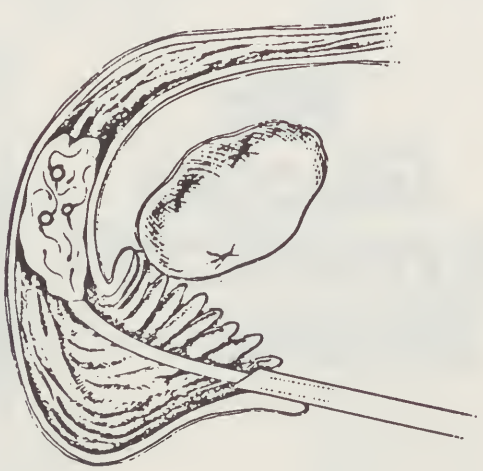

Figure 5. The GIFT procedure: cannulation of the fallopian tube.

New research and technologies will help more patients who were previously thought to be intractably infertile.

WANTED

Patriotic Physician to join
MARYLAND AIR NATIONAL GUARD
to protect the health of those who help to protect you.

Contact Salvatore J. DeMarco III, M.D. (301) 659-7222 for information.

We Guard America's Skies.

192nd Annual Meeting

of the

Medical and Chirurgical Faculty of Maryland

1990s- What Can We Expect?

Wednesday, Thursday, Friday

May 9, 10 & 11, 1990

Turf Valley Hotel and Country Club
Ellicott City, Maryland

Featuring:

- Wednesday's Plenery Speaker - *Lonnie R. Bristow* MD, AMA Trustee
- Friday's Symposium - **"What to Expect in the 1990s"**
  - *Thomas Reardon* MD, AMA - **"Physician Payment, Potential Changes: Issues and Answers"**
  - *Palma E. Formica* MD, AMA - **"Long Range Plans and Expectations"**
  - *Ross N. Rubin* Esq, AMA, *John Sewerd* MD, AMA and *John Zapp* DDS, AMA - **"Legislative Affairs"**
- Friday's Guest Lecturer-*Victor A. McKusick* MD, Prof. of Medical Genetics, JHU

Meeting Registration

____ Member of Med Chi (Includes Wed. & Thurs. lunch)	NO CHARGE	
____ Non-Member Physician (check category that applies)		
____ Registering for entire meeting (includes 1 lunch)	$200.00	$_____
(After April 25)	$220.00	$_____
____ Apply fee to first year's dues		
____ Credit hours only (per credit Hour)	$20.00	$_____
____ No CME credits, No lunch	NO CHARGE	
____ Resident and Students (Includes 1 lunch)	$30.00	$_____
____ Can apply to first year's dues		
____ Allied Health Professional w/ letter of accreditation & 1 lunch	$50.00	$_____
____ No CME credits, No lunch	NO CHARGE	

Meal Function Registration

____ Lunch, Wednesday, May 9 ____ Lunch, Thursday, May 10

NO CHARGE for Med Chi Members BUT reservations required.

Additional Tickets (Indicate number)

____ Lunch, Wednesday, May 9	$10.00	$_____
____ Lunch, Thursday, May 10	$10.00	$_____
____ Prayer Breakfast, Thursday, May 10, 7:15 a.m.	$12.00	$_____
____ Presidential Banquet, Friday, May 11, 6:30 p.m.	$65.00	$_____
TOTAL AMOUNT ENCLOSED		$_____

PLEASE TURN TO OPPOSITE SIDE AND COMPLETE.

Pre-Registration Form

Please check the lectures you are most likely to attend *(for the purpose of room assignments).*

Wednesday, May 9

2:00 - 3:45 p.m.

- ☐ Plenary Session - "Health Care Financing - An American Solution"

3:45 - 5:45 p.m.

- ☐ "Examination of the Expert Medical Witness: A Mock Trial"
- ☐ "Computers in Your Office"
- ☐ "Physician as an Employer in the 1990s"
- ☐ "The Anatomy of a Case"
- ☐ "Children of Working Parents"
- ☐ "The Disease of Addiction - Impact on Feelings"
- ☐ "Reconstruction of the Breast- An Evaluation of Advances and Persistent Problems"

Thursday, May 10

7:15 - 8:45 a.m.

- ☐ Prayer Breakfast - "How Long Have You Had This?"

8:45 - 10:15 a.m.

- ☐ "Physician Character & Personality Traits That Predict Less Than Adequate Practice Standards"
- ☐ "AIDS - A Medical and Legal Review and Update for the 1990s"
- ☐ "Prevention of Blindness by Diabetes"
- ☐ "Practical Techniques for Promoting Your Practice"

2:00 - 3:30

- ☐ "Managing Multiple Risks in Cardiovascular Diseases"
- ☐ "Voice Disorders: Their Recognition, Treatment, and Prevention"
- ☐ "Sick Building Syndrom: Environmental Causes of Respiratory & Skin Allergy Problems"
- ☐ "AIDS in the 1990s - Living Long and Living Well: A Case for Optimism"
- ☐ "The Physician as Gatekeeper - A Professional Contradiction"

8:45 - 12:15 p.m.

- ☐ "The Great Cholesterol Controversies"

10:45 - 12:15 p.m.

- ☐ "Tobacco Dependence as an Addiction"
- ☐ "Movement Disorders in Primary Care and Psychiatry"
- ☐ "The Care of the Alzheimers Patient After Diagnosis"
- ☐ "Panel on Issues in Managed Care in Maryland"

3:45 - 5:45 p.m.

- ☐ "Stroke Care in the 90s: An Update on the Management of Acute Stroke and Stroke Rehabilitation"
- ☐ "Analysis of Physician Practice Variations - Implications for the 1990s"
- ☐ "Hepatobiliary Imaging in Noncalculus Hepatobiliary Disease with Emphasis on Surgically Correctable Disorders"
- ☐ "Young Physicians in the 1990s"
- ☐ "Breast Cancer: The Value of Mammography"

Friday, May 11,1990

8:45 - 10:15 a.m.

- ☐ "Findings of the Statewide Quality Assurance Committee"
- ☐ "Common Sense Approach to the Management of Hypertension"
- ☐ "High Risk Infants"
- ☐ "Modern Management of Communicable Diseases"
- ☐ "Using the Computer for Your Continuing Medical Education"

8:45 - 12:15 p.m.

- ☐ "Symposium - What to Expect in the 1990s" (Physician Payment, Long Range Planning, Legislative Affairs)

10:45 - 12:15 p.m.

- ☐ "Recognition & Management of Melanoma and its Precursors"
- ☐ "Environmental and Occupational Health Threats"
- ☐ "Long-Term Care Insurance"

1:00 - 1:45 p.m.

- ☐ Victor A. McKusick Lecture

Bone Marrow Transplantation in Lysosomal Storage Diseases: A Prelude to Gene-Insertion Therapy

Andrew M. Yeager MD

From The Oncology Center and the Departments of Pediatrics and Neurology. Dr. Yeager is Pediatrician-in-Charge, The Johns Hopkins Bone Marrow Transplantation Program; Associate Professor of Oncology, Pediatrics, and Neurology, The Johns Hopkins University School of Medicine, Baltimore.

Supported in part by grant nos. RO1 NS14097 and P01 CA15396 from the National Institutes of Health, Department of Health and Human Services, Bethesda, MD, and by Basil O'Connor Starter Research Grant no. 5-485 from the March of Dimes Birth Defects Foundation, White Plains, NY. *Reprints: Dr. A.M. Yeager, Room 3-127, The Johns Hopkins Oncology Center, 600 N. Wolfe St., Baltimore, MD 21205.*

Allogeneic bone marrow transplantation is a therapeutic option for enzyme replacement in children with lysosomal storage diseases, for which no current conventional treatments are curative. Although marrow allografting is costly, intensive, and not risk free, strides are being made in the management and prevention of procedure-related complications.

Human lysosomal storage diseases include the mucopolysaccharidoses (Hurler, Hunter, and Maroteaux-Lamy syndromes) and the sphinogolipidoses (Gaucher disease, metachromatic leukodystrophy). These heritable conditions, usually autosomal recessive or linked to the X chromosome, are caused by deficiencies of specific acid hydrolases normally present in the lysosomes and are associated with significant morbidity and mortality in affected children. Manifestations of storage diseases are in large part attributable to accumulation in various tissues and organs of the substrate (or derivatives thereof), that otherwise would be degraded by the enzyme in which the patient is deficient. Depending on the lysosomal hydrolase deficiency and the nature of the substrate that accumulates, there may be organ enlargement (for example, hepatosplenomegaly), corneal clouding, limitation of joint mobility, or skeletal abnormalities. Demyelinating neuropathy may be a feature in some sphingolipid storage diseases; the loss of myelin sheaths is due to toxic effects of substrate derivatives such as psychosine in Krabbe leukodystrophy, leading to destruction of oligodendroglial and Schwann cells. The management of children with lysosmal hydrolase deficiency states has been limited to symptomatic supportive care. Many affected children die with progressive disease within the first decade of life; patients who reach adulthood are often profoundly impaired because of the multisystem deterioration.

We present the rationale for enzyme replacement therapy in these devastating storage diseases and the application of cellular grafts as a source of hydrolase in these conditions. We also focus on the use of bone marrow transplantation (BMT) as a self-renewing source of lysosomal enzyme.

Enzyme Replacement in Storage Diseases

Although numerous *in vitro* studies have demonstrated the uptake of exogenous hydrolases by enzymatically deficient cells, clinical trials of short-term intravenous enzyme infusion in various storage diseases in general have been unsuccessful. Several possible reasons for the failure of enzyme-replacement therapy in these conditions are: the lack of sufficient quantities of purified nonimmunogenic human hydrolase; the inability to attain normal plasma levels for prolonged periods of time; the rapid hepatic clearance of exogenous hydrolase from the circulation; and the impermeability of the blood-brain barrier to even therapeutic levels of enzyme in the plasma.[1] Another therapeutic alternative to enzyme infusion in storage diseases is to provide a tissue allograft from an enzymatically normal donor, as a viable cellular source of the deficient hydrolase. Unfortunately, attempts at enzyme replacement by allografts of normal skin, cultured fibroblasts, or amniotic epithelium at best have led to transient biochemical alterations but no objective clinical improvement.

Bone Marrow Transplantation: An Overview

Transplantation of bone marrow from a healthy donor (usually a fully histocompatible sib) provides a source of "stem cells," those primitive, pluripotent cells that, with the appropriate factors (such as the marrow microenvironment, stimulatory lymphokines and growth factors, and cellular interactions) will proliferate and differentiate into lymphoid, hematopoietic, and reticuloendothelial cell systems within the recipient.[2] Importantly, the stem cell is also capable of self-renewal and thus provides a sustained source of its own cell population.

After BMT, therefore, the marrow allograft recipient is a "chimera" (taken from the beast of Greek mythology with the head of one animal and the body of another), since the patient's hematopoietic system is of foreign (donor) origin: the circulating erythrocytes, leukocytes, platelets, and lymphocytes of the allogeneic BMT recipient are all donor in origin and type. In addition, monocyte/macrophage-derived cells such as hepatic Kupffer cells, pulmonary alveolar macrophages, and osteoclasts (which resorb and remodel bone) are repopulated with donor-derived cells. Since the normal donor cells also provide a self-renewing cellular source of hydrolase, BMT could be viewed as a form of enzyme replacement therapy in patients with various storage diseases.[3-5] In addition, preclinical studies and preliminary clinical reports suggest that phagocytic mononuclear cells in the central nervous system (CNS) also may be replaced by donor cells after BMT; this finding is especially relevant to the possible therapeutic role of BMT in the treatment of lysosomal storage diseases with CNS manifestations.

Satisfactory allogeneic BMT is dependent on two factors.[1] First, there must be a suitably histocompatible "match" between donor and recipient to minimize the risks of graft rejection or, more commonly, severe graft-versus-host disease (GVHD). A "perfect match" between donor and recipient is defined as identity of the HLA antigens (HLA-A, -B, -C, and -D/DR/DQ) by serological testing and by lack of reactivity between donor and recipient lymphocytes after co-incubation, that is, a negative mixed lymphocyte culture (MLC). In general, healthy sibs who are fully matched at the HLA loci and who demonstrate a negative MLC with the recipient are the preferred donors; in practice, there is a 25 to 40 percent chance that a sib is histocompatible. Although results of allogeneic BMT with related donors who are mismatched at up to one HLA locus are good, these transplants carry slightly higher risks of marrow graft rejection and GVHD, as indicated above. A great deal of interest recently has been directed in unrelated volunteer marrow donor registries, and the preliminary results of allografting with histocompatible unrelated donors are likewise encouraging.

The second requirement for successful BMT in genetic diseases is an adequate preparative regimen, that is, the pretransplant conditioning given to the marrow transplant recipient. The preparative regimen serves a dual purpose. First, it provides adequate, intensive immunosuppression to prevent rejection of the allograft by the host immune system, analogous to (but much more intensive than) the immunosuppression employed in solid organ transplantation. In general, high-dose intravenous cyclophosphamide (Cytoxan®) is used for this purpose. Second, the preparative regimen must ablate the host marrow to provide physical space and, therefore, a proliferative advantage to the infused donor stem cells. Methods to "displace" the host bone marrow - essentially, to induce marrow aplasia by elimination of host stem cells and committed hematopoietic progenitors. Total body irradiation often has been used for this purpose. Under the leadership of Dr. George Santos, Director of The Johns Hopkins Bone Marrow Transplantation Program, a preparative regimen that uses marrow-lethal chemotherapy instead of total body irradiation has been developed. This regimen, which consists of high-dose busulfan (Myleran®) and cyclophosphamide, has been effective in pre-BMT conditioning of patients with acute myeloid leukemia[6] and also has been used as an immunosuppressive/myeloablative regimen in children receiving allogeneic marrow grafts for beta-thalassemia major (Cooley's anemia).[7]

To prevent the development of acute graft-versus-host disease (GVHD), a consequence of disparity at minor histocompatibility antigens (which are not assessed by serologic HLA typing or by the MLC), post-BMT immunosuppression is warranted. Prophylaxis against acute GVHD facilitates development of tolerance of the proliferating donor immune system to the host tissues. Currently most BMT centers use the potent immunsuppressive agent cyclosporine (alone

or in combination with other agents such as low-dose methotrexate or corticosteroids) for several months after BMT to prevent or treat acute GVHD.

Allogeneic BMT has demonstrated therapeutic effectiveness in severe aplastic anemia and other bone marrow failure states and in hematologic neoplasia, such as acute leukemias and chronic myelogenous leukemia. In addition, marrow allografts may be curative in cellular immunodeficiency states such as the severe combine immunodeficiency and Wiskott-Aldrich syndromes by repopulation of the deficient or defective lymphoid system. Nevertheless, allogeneic BMT is not a risk-free procedure. Even with an allogeneic marrow transplant from a histocompatible sib donor, there is a 25 to 35 percent chance of death from transplant related complications, chief among them acute and chronic GVHD and the development of fatal opportunistic infections such as cytomegalovirus interstitial pneumonitis. This must be factored into the risk-benefit analyses when one considers BMT as a therapeutic option in human diseases.

BMT in Storage Diseases: Lessons from the Lab

A major drawback to the evaluation of the potential effectiveness of BMT in lysosomal storage diseases has been the lack of authentic animal models of these disorders. The ability of allogeneic BMT to normalize levels of hydrolase in tissues outside the CNS was initially demonstrated by Slavin and colleagues in the beta-glucuronidase-deficient mouse, but extrapolation of these data to the clinical situation are limited because beta-glucuronidase deficient mice do not have clinical manifestations of storage disease and have a normal lifespan even without marrow grafting.

In 1980, investigators at The Jackson Laboratory described a new autosomal recessive mutation called the "twitcher" mouse. Affected animals appear normal at birth but develop truncal tremor and limb paralysis by three to four weeks of age and die with failure to thrive and progressive neurodegeneration by five to seven weeks of age. Neuropathological abnormalities in twitcher mice include total demyelination of peripheral nerves and presence of characteristic "globoid cells" (phagocytic cells that contain myelin degradation products) within the central nervous system. Biochemically, these mice lack the lysosomal hydrolase galactosylceramidase, which is essential for myelin synthesis. In addition, psychosine (galactosylsphingosine) accumulates in twitcher mouse tissues; this compound is highly cytotoxic, especially to oligodendroglia and Schwann cells that are responsible for maintenance of myelin sheaths. From clinical, histopathological, and biochemical standpoints, therefore, the twitcher mutant appears to be an authentic preclinical model of the human sphingolipidosis Krabbe disease (galactosylceramidase deficiency; globoid cell leukodystrophy), and an ideal model in which to study the effects of enzyme replacement through BMT.

Beginning in 1982, our laboratory has undertaken comprehensive investigations of BMT in the twitcher mouse model of storage disease. Initially we demonstrated that BMT from enzymatically normal mice in twitchers with advanced neurodegeneration did not prolong survival, suggesting that the optimal time for intervention was in presymptomatic mice. Indeed, when BMT was carried out in 10-day-old twitcher mice (identified as enzymatically deficient by galactosylceramidase assays on homogenates of clipped tail tips), there was a two- to threefold prolongation of survival (90 to 120 days, versus 35 to 45 days in untransplanted animals).[8] Transplanted twitcher mice did not develop the characteristic hindlimb paralysis seen in untreated mice and also had improvement in their gait, foraging, and grooming behaviors. Histopathological examination indicated that a gradual remyelination occurred in the sciatic nerves of twitcher mice two to three months after BMT.[8] These neuropathological observations were then correlated with neurophysiological studies, which indicated that BMT stabilized sciatic nerve motor conduction velocities in twitchers.

The issue of entry of donor-derived enzyme and/or donor mononuclear cells into the CNS is especially critical in considering BMT for storage diseases with central nervous system manifestations. Using the twitcher mouse BMT model system, we recently found that galactosylceramidase appears in various twitcher mouse tissues, including the CNS, after transplantation of enzymatically normal donor bone marrow.[9] In addition to providing enzyme replacement in the CNS of twitcher mice, BMT also stabilized the levels of psychosine (the major toxic metabolite in globoid cell leukodystrophy) in the brains of transplanted twitcher mice to approximately one tenth of the levels observed in untreated animals.[9] Other investigators recently used our twitcher transplant model to demonstrate the appearance of donor mononuclear cells in the brains of twitcher mice after BMT, indicating a trafficking of donor cells across the blood-brain barrier.

Favorable effects of BMT from enzymatically normal donors subsequently have been reported in several other animal storage diseases, including feline mucopolysaccharidosis VI (a model of the Maroteaux-Lamy syndrome), canine mucopolysaccharidosis I (a model of the Hurler syndrome), and canine fucosidosis. Taken together, laboratory observations in the twitcher mouse and in these other animal model BMT systems are especially encouraging for the clinical application of BMT in children with lysosomal storage diseases.

Results of Clinical BMT

Initial reports from the Westminster (UK) marrow transplant program in 1981 indicated that BMT from normal related donors could provide enzyme replacement and favorable effects on clinical manifestations in children with mucopolysaccharidosis I (MPS I; the

Hurler syndrome),[10,11] and this encouraging experience has been confirmed at other transplant centers. After BMT, children with MPS I have had resolution of hepatosplenomegaly and corneal clouding and improvement in joint mobility. Biochemically, appearance of the deficient enzyme (alpha-L-iduronidase) in the donor-derived leukocytes was followed, several months later, by normalization of urinary excretion of substrate (glycosaminoglycans). At the minimum, children with MPS I have had stabilization of developmental quotient; in several instances, there even has been significant improvement.[12] Other mucopolysaccharidoses without CNS involvement, such as the Maroteaux-Lamy syndrome (MPS VI), have been successfully treated by allogeneic BMT[12,13] in these cases, the associated skeletal abnormalities may persist for several years after BMT before improvement.[13] It is not clear that severe mental retardation can be reversed in children with mucopolysaccharidoses in which the predominant manifestations are in the CNS (for example, Sanfilippo syndrome [MPS III]), although biochemical improvement (that is, appearance of enzyme, normalized urinary substrate excretion) will be observed after BMT in such patients.

Several sphingolipid storage diseases such as metachromatic leukodystrophy (MLD; arylsulfatase A deficiency) and Gaucher disease (glucocerebrosidase deficiency) also are characterized by clinical manifestations related to abnormal substrate accumulation (for example, sulfatide or glucocerebroside) within tissues. In MLD, as in the twitcher murine model, demyelination of peripheral nerves takes place. The favorable effects of BMT in the twitcher mouse appeared to justify judicious, critical studies of clinical BMT in MLD and other sphingolipidoses.

At The Johns Hopkins Oncology Center we have conducted allogeneic BMT from histocompatible related donors in two children with advanced MLD, using a preparative regimen of high-dose busulfan and cyclophosphamide. At the time of transplant, each child had substantial loss of motor skills and was unable to walk due to demyelinating neuropathy. In one of these patients, a two and one-half year-old girl, arylsulfatase A activity in the peripheral blood leukocytes was normal by three weeks after BMT; unfortunately, the patient died 50 days after BMT from overwhelming pneumonitis due to adenovirus. In the brief posttransplant period, we did not observe any objective clinical improvement in this child. The second patient, a five-year-old boy, also had appearance of donor-derived enzyme in the circulation within the first month after BMT; approximately 15 months after transplant, urinary sulfatide excretion decreased to normal levels. This child's motor nerve conduction velocities have stabilized, and he now has some movement and function in both upper and lower extremities. In addition, he has had no further deterioration in mental status.

Other centers have shown clinical and biochemical improvement in children who have received allogeneic BMT for MLD[14,15] or for Gaucher disease.[16,17] However, our observations and those of others strongly indicate that allogeneic BMT has very limited value when carried out in patients with advanced deterioration attributable to the storage disease; the biochemical success does not correlate with reversal of significant organ damage. Conversely, the pioneering studies of Krivit and colleagues at the University of Minnesota[15] demonstrated that allogeneic BMT can actually prevent the neurological deterioration in MLD when the transplant is carried out at the earliest stages of disease, ideally in a presymptomatic patient. Indeed, this setting of "minimal residual disease" represents the best opportunity for BMT to provide effective tissue repair in storage diseases.

Speculations for the Future

Allogeneic bone marrow transplantation represents a crude form of genetic therapy in storage diseases by replacing enzyme-deficient cells with normal ones. Rapid advances in molecular genetics include the genomic localization and cloning of several lysosomal hydrolases, as well as techniques for the introduction into cells and intracellular expression of exogenous genetic material. Refinements and combination of these highly sophisticated technologies will form the cornerstone for the ultimate somatic-cell therapy in human storage diseases by replacement of the specific cloned lysosomal hydrolase gene that is deficient or defective in the patient. It is envisioned that gene-replacement therapy will entail introduction of the normal gene into the patient's own (autologous) bone marrow cells and the intravenous infusion of these genetically modified stem cells into the patient. The need for and choice of a pre-autograft preparative regimen in children undergoing this gene-replacement therapy is unknown, but it is probable that some form of space making (for example, high-dose busulfan or total body irradiation) will be required to allow engraftment and proliferation of autologous stem cells into which the normal lysosomal hydrolase genes have been introduced.

Summary

Allogeneic BMT is now a therapeutic option for enzyme replacement in children with lysosomal storage diseases, for which no conventional treatments are curative. The best results are to be obtained in children who are asymptomatic or who have only the earliest and most subtle manifestations of disease; there is no benefit of BMT in patients with severe, progressive organ or tissue damage (for example, paralysis in the case of metachromatic leukodystrophy). This highly sophisticated procedure is available at only a limited number of specialized medical centers at this time. Marrow allografting is

costly, intensive, and not free of risks, but strides are being made in the management and prevention of procedure-related complications such as graft-versus-host disease and opportunistic infections. Use of unrelated marrow donor registries may allow more children with storage diseases to receive BMTs. Careful clinical studies of BMT in genetic diseases, with complementary comprehensive preclinical laboratory evaluations in animal models of disease and with particular attention to the long-term results in children who have received BMTs, will provide principles for the rational implementation of gene-replacement therapy in these otherwise devastating metabolic disorders of childhood.

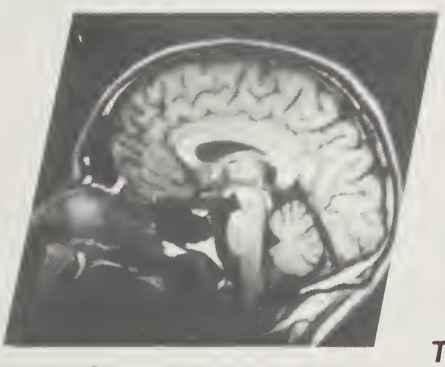
ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.



MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

We Could Give Your Talents Maximum Exposure on the Cover of *MMJ*

Jerrold M. Post MD, 1989 first place winner in the Color Category had his photo published on the December cover of MMJ.

Enter the TENTH ANNUAL MED-CHI PHOTO CONTEST

ENTER EARLY-- Deadline for Entries--APRIL 20, 1990
2 CATEGORIES: Black and White OR Color
First and Second Prizes Awarded in Each Category
Open to MED-CHI Members and Auxiliary Members
All Photographs will be displayed at the *1990 ANNUAL MEETING* at Turf Valley Hotel and Country Club.

MED-CHI Photo Contest Rules

Eligibility

All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

Contest Rules

1. Photographs may be submitted in two categories-- Black and White or Color.
2. Limit: three entries per person
3. Prints only, no smaller than 8x10 or larger than 11x14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on Friday, April 20, 1990.
7. Photographs entered in the contest will be on display at the Annual Meeting in May of 1990.
8. Prizes will be awarded to the FIRST AND SECOND place winners. Additional information about the prizes will be published in the Journal.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, May 9-11, 1990.
10. Photographs will NOT be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting at noon on Friday, May 11, or at the Faculty Building thereafter.
11. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

Laser Therapy in the Treatment Of Congenital Vascular Abnormalities

Renuka Diwan MD

From the Department of Dermatology, Division of Dermatologic Surgery, The Johns Hopkins Hospital, Baltimore.

Portwine stains, especially on the face, have serious psychological and emotional impact for affected children. Laser therapy has been the only effective means for treating these lesions. The argon laser has been the mainstay, but more recently the flashlamp-pumped pulsed dye laser has added significantly to the management of portwine stains as well as to the effective treatment of other vascular lesions such as telangiectasias and angiomas.

Congenital vascular abnormalities are found in 20 to 40 percent of newborns and form a wide spectrum of lesions. Hemangiomas constitute a significant proportion of these. The incidence of strawberry hemangiomas has been estimated to be 2.6 percent and that of portwine stains 0.3 percent.[1] The natural history of strawberry hemangiomas is one of eventual spontaneous resolution with some exceptions; in contrast, portwine stains are permanent. Because the majority of them are located on the face they cause significant disfigurement leading to social stigmatization of young children, which can have severe psychological and emotional impact.

Before the availability of newer laser systems, various approaches were tried to camouflage or treat these lesions including the skillful use of makeup, tattooing of the overlying skin with pigments to achieve a normal skin tone, cryotherapy, grenz rays, ionizing radiation with thorium X, and radical surgical resection followed by reconstruction. Each was less than ideal, and the search for better tools led to the development of laser systems. A variety of lasers have been evaluated for the treatment of portwine stains.

Principles and Mechanism

The ideal laser should produce irreversible destruction of the abnormal blood vessels of a portwine stain with no damage to other structures, without scarring or other adverse sequelae, and with the final result of normal skin. It is this goal that has led to the continuing search for better laser systems.

The principle behind the use of lasers is selective destruction of a target by selective absorption of laser energy. To achieve this the wavelength of the laser energy must correspond to the wavelength most selectively absorbed by the target. (The wavelength most selectively absorbed must be differentiated from the one best absorbed. The wavelength best absorbed by a given target also may be absorbed significantly by other targets leading to interference with energy delivery to the target.) Therefore, to obtain selective destruction of the abnormal vessels of the portwine stain the laser must use a wavelength that is selectively absorbed by the ectatic vessels.

Blood vessels contain oxyhemoglobin-containing erythrocytes. Oxyhemoglobin is a chromophore that can be selectively targeted in portwine stains. The absorption curve of oxyhemoglobin (Figure 1) shows three peaks (that is, preferential absorption) at the following wavelengths: a large peak at 418 nm (known as the Soret band) and two smaller peaks at 542 and 577 nm. Laser energy with a wavelength of 418 nm would be most efficiently absorbed by oxyhemoglobin but also would be significantly absorbed by epidermal melanin, leaving much less energy for absorption by oxyhemoglobin. Longer wavelengths are less efficiently absorbed by melanin and therefore would penetrate better. The optimal laser should emit a wavelength of 577 nm to reduce melanin interference while corresponding to an oxyhemoglobin peak.[2]

After absorption by oxyhemoglobin the light energy is converted to thermal energy. Heat generated within erythrocytes leads to their coagulation within the vessels, and conduction of heat to the vessel wall leads to its irreversible damage. Temperatures of 80-85° C are reached, resulting in melting of DNA and membrane disruption, and are regarded as an upper limit for survival of active cells.[3] Continued delivery of laser energy causes heat conduction beyond the confines of the blood vessels resulting in excessive dermal damage and increased risk of scarring. Thus, to maintain selective blood vessel destruction, laser energy must be delivered for a critical time only. Containment of the thermal energy within the target (in this case blood vessels) is known as thermal spatial confinement.[4] The period for which thermal spatial confinement is maintained is known as the thermal relaxation time. The thermal relaxation time for a given blood vessel can be calculated: for blood vessels of a portwine stain it is in the range of 1 to 10 msec, reflecting the variation in the vessels' size. The duration of the pulse of laser energy (pulse width) should therefore be less than 1 msec to obtain thermal spatial confinement.

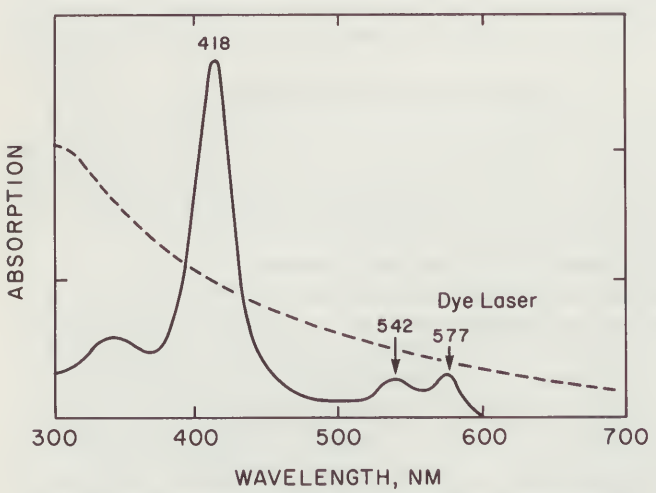

Figure 1. The absorption curves of oxyhemoglobin and melanin Oxyhemoglobin absorbs preferentially wavelengths of 418, 542 and 577 nm. Melanin interference decreases as wavelength increases.

Clinical Experience

The ruby laser was the first available medical laser. It was the first laser used for treating portwine stains but was replaced by the more effective argon, which has been the most widely used. Experience with the argon laser for treatment of portwine stains extends over almost twenty years.

Argon Laser

The argon laser is a low-power continuous-wave laser. The argon laser was chosen for its wavelength. This laser emits blue-green light with wavelengths in the range of 458 nm to 514 nm with 80 percent of the energy contained in the 488 and 514 nm peaks. These wavelengths correspond well to the absorption band of oxyhemoglobin. However, there is significant interference by epidermal melanin, which absorbs in this spectrum as well. The remaining energy is then absorbed by oxyhemoglobin in blood vessels of the portwine stain. The thermal energy generated destroys the blood vessels, but due to lack of thermal spatial confinement (because the energy cannot be pulsed) the epidermis, surrounding dermis, and adnexa also are destroyed by the heat.[5] Thus, nonselective damage occurs, and the wound (essentially a burn) heals in a month with the formation a hypopigmented scar lacking normal skin markings and texture.

Most studies[6-8] have reported good to excellent results in approximately 75 percent of portwine stains treated with the argon laser but usually without complete fading of the lesion. The lesions most likely to be treated successfully with the argon laser are those in older patients (35 years or older), dark red to purple in color, nonblanching, and histologically have at least 15 percent of their vessels filled with red blood cells.[9] Nodules and blebs that develop in portwine stains of older patients frequently respond well to the argon laser. Limitations of this laser have been a 25 percent rate of poor response with an associated 10 to 15 percent incidence of hypertrophic scarring.

The higher incidence of scarring in children along with a lower efficacy for the lighter, more blanching portwine stains usually found in childhood has led to limited use of argon laser with this age group. This has been a significant drawback because children are most affected by the psychological impact of portwine stains, and intervention at an early age would be most beneficial. Another side effect has been hypopigmentation due to interference by melanin absorption of the wave-lengths. The argon laser wavelengths do not penetrate beyond 0.10 mm into the dermis and are not effective for deeper vessels, thus there are only partial responses for deeper lesions.

Carbon Dioxide Laser

Because nonselective thermal damage resulted from the use of the argon laser, the carbon dioxide laser

(which also produced nonselective thermal injury) was evaluated for the treatment of portwine stains. This laser delivers infrared energy with a wavelength of 10,600 nm and is absorbed by water. Cellular water absorbs the energy and is heated to 100° C. Thus, vaporization of the tissue occurs and successive layers are vaporized until the vessels in the portwine stain are destroyed. The resulting wound is a burn, and like the argon laser wound, heals in three to four weeks with a hypopigmented scar that lacks normal skin markings and texture. It is a poor cosmetic result. Complications include hypertrophic scarring, especially in children. Treatment is done on an outpatient basis and requires the use of local anesthesia.

The neodymium-YAG laser and the carbon dioxide laser have been useful adjuncts to the argon laser for treating nodular portwine stains in older patients.[10] Despite the favorable results obtained with the argon laser its limitations led to the continuing search for more effective treatment systems. Newer laser systems have included the copper vapor laser and the flashlamp-pumped pulsed dye laser.

Flashlamp-Pumped Pulsed Tunable Dye Laser

One of the most significant developments in the field of dermatologic laser therapy has been the successful treatment of portwine stains with the flashlamp-pumped pulsed dye laser, specifically developed for the treatment of portwine stains.[11] This laser emits yellow light with a wavelength of 577 nm and a pulse width of 450 microsec. These parameters have brought it close to the ideal laser for the treatment of portwine stains. The wavelength corresponds to an oxyhemoglobin peak with the least melanin interference, and the pulse width is shorter than the thermal relaxation time calculated for vessels in a portwine stain.

After trials with varying pulse widths, an optimal width of 450 microsec was chosen over shorter pulse widths.[4,12] While histologic examination of lesions treated with very short pulse widths shows blood vessel disruption, the injury is reversible. It is possible that healing of abnormal vessels instead of their permanent destruction results in the observed decrease in efficacy with very short pulse widths. Histologic examination of portwine stains immediately after treatment with longer pulse widths reveals the presence of a normal epidermis, a coagulum of erythrocytes, platelets, and fibrin; destruction of endothelial cells, pericytes, and veil cells that constitute the vessel wall; and focal degeneration of perivascular collagen. Irreversible destruction of the vessel wall correlates with good clinical fading of the portwine stain, and lack of significant damage to the epidermis and surrounding dermis correlates with preservation of normal skin texture and color without scarring. The ectatic vessels of the hemangioma are replaced by histologically normal dermal blood vessels.

Treatment can be performed on patients of all ages, including infants only a few months old.[13] Its efficacy and safety in infants is one of its most important advantages because children can be treated before they enter school, preventing the psychological trauma that may develop in such situations. Outpatient treatment does not require anesthesia in adults.[4,14] The discomfort produced by each laser pulse is likened to a pinprick and can be tolerated by most adults and older children. Younger children often are frightened and difficult to control even with the help of their parents. Management of such children remains the subject of controversy: some authorities do not use any local or systemic medication, while other experienced specialists advocate general anesthesia to achieve maximum cooperation and control. Local anesthesia by nerve blocks or subcutaneous infiltration (without epinephrine), with or without sedation, is also useful for any patient who finds the discomfort difficult to tolerate.

Before initiating treatment, test spots are done to determine the lowest effective dose, and the test response is evaluated in three months. The immediate response to treatment is the development of purpura, which correlates with intravascular thrombus formation observed histologically, there being very little or no extravasation of blood. No postoperative care is necessary except in children for whom a dressing provides protection from trauma and resultant scarring. The purpura resolves in two weeks, and makeup can be used carefully to camouflage the purpura, if necessary.

Since lightening occurs over the three months following treatment, treated areas are retreated only after that period. Excellent results are achieved with sequential treatments (Figures 2 and 3) with complete disappearance of the portwine stain, with rare exceptions. The treated area has normal color, skin markings, and texture. Scarring does not occur unless the treated area is traumatized, as it can be in young children.

Portwine stains that have had partial response to treatment with other lasers or radiation can be treated with the pulsed dye laser. Because the pulsed dye laser is not as effective for nodular hemangiomas as it is for

Figure 2. Purple portwine hemangioma in a 27-year-old-woman*

* These figures were published in Garden JM, Tan OT, Parrish JA. The pulsed dye laser: Its use at 577 nm wavelength. J Dermatol Surg Oncol 1987; 13:134-38. Reprinted with permission.

the flat ones, the argon laser is still useful for nodules that develop in portwine stains of older patients, for venous lakes, and other similar larger ectasias.

Summary

Of the presently available modalities, the pulsed dye laser has had the best success in treating portwine stains. Its most important application has been in treating infants (as young as three months old) and in preventing their psychological and emotional trauma.[13] This is an important advance in the treatment of a disorder for which dermatologists and other physicians have not been able to offer any other treatment that is as effective. Its role in preventing the growth of strawberry hemangiomas by their early treatment needs to be investigated.

Treatment of portwine stains and other vascular lesions (such as multiple or resistant telangiectasias on the face (Figures 4 and 5) and trunk, and cherry angiomas) with the pulsed dye laser will soon be offered to patients by the department of dermatology at The Johns Hopkins Hospital. Outpatient facilities and support from the department of anesthesiology will allow optimum treatments of patients with individual needs.

Genetic Linkage Studies Of Bipolar Affective Disorder

Sylvia G. Simpson MD, Susan E. Folstein MD, and J. Raymond DePaulo Jr., MD

From The Johns Hopkins Hospital School of Medicine, Baltimore.

Underrecognition and undertreatment of affective disorders constitute a serious public health problem in this country. The recent availability of improved methods of genetic linkage analysis make the definition of the genetic basis of some types of bipolar affective disorders feasible within the foreseeable future.

Bipolar affective disorder, formerly known as manic-depressive illness, is characterized by episodes of mania and depression, both of which cause significant impairment. The illness affects about 1.5 million Americans at some time in their lives and takes a tremendous toll in terms of personal suffering, disruption of relationships and careers, loss of lives, and the economic cost of lost productivity.

Despite our ignorance of fundamental mechanisms underlying these clinical disorders, several remarkably effective treatments have been discovered, including tricyclic antidepressants, monoamine oxidase inhibitors, and electroconvulsive treatment (ECT) for depression and neuroleptic drugs, lithium, and carbamazepine for mania. Lithium and carbamazepine are also effective in preventing relapses of either depression or mania. Overall, about 80 percent of bipolar patients can expect an excellent response to treatment. However, only 20 to 30 percent of affected individuals get both accurate diagnosis and appropriate medical therapy.

About half of all individuals with major depression do not seek treatment. Those who do may not be accurately diagnosed or if diagnosed, may receive inappropriate or inadequate treatment. Manic patients often attract sufficient attention to become hospitalized but may be misdiagnosed as schizophrenic and miss the opportunity for lithium therapy. The need for a useful diagnostic test for these patients cannot be overemphasized.

Evidence of a genetic contribution to the etiology of affective disorders comes from family, twin, and adoption studies. Controlled family studies such as those by Gershon et al.[1] and Mendlewicz and Rainer[2] show dramatically increased rates of affective disorders in family members of affectively ill probands, compared with family members of probands who have other psychiatric disorders or no psychiatric disorder. Twin studies[3] show greater concordance for affective disorders among monozygotic than among dizygotic twins. An adoption study[4] showed that affective disorders were more common in adopted children whose biological parents had the illness, regardless of the health status of the adoptive parents. While there is considerable evidence for an important genetic contribution to the etiology of bipolar disorder, knowledge regarding the mode(s) of transmission is lacking.

Recent advances in molecular biology have led to a dramatic increase in knowledge regarding the genes and genetic mechanisms involved in simply inherited genetic diseases. These developments have led to a shift in emphasis from the mathematical estimation of recurrence risks and patterns of transmission (segregation analyses) to the search for genetic markers linked to genes for the major psychiatric disorders (linkage analyses). In linkage studies, evidence for or against a hypothesized location of a disease gene is obtained by following the distribution of the disease phenotypye and of a genetic marker among family members. If the marker and disease phenotype co-segregate so frequently that the odds against the co-segregation being due to chance exceed 95 percent, then they are considered to be linked. The likelihood of linkage is usually expressed as a logarithm to the base 10 of the odds ratio of the probability of linkage to the probability of no linkage and is called a LOD score. A LOD score of 3, which represents odds of 1000 to 1 favoring linkage, is the 95 percent confidence level used when testing one marker locus and one disease gene locus.

The earliest linkage studies of bipolar disorder used genetic traits as markers. Reliance on traits such as color blindness and classical protein markers such as G6PD as markers has been nearly obviated by the use of restriction fragment length polymorphisms (RFLPs).[5] RFLPs are variations in DNA fragments produced after DNA has been digested by enzymes (restriction endonucleases) that cut it at specific base sequences. The large number of RFLPs that occur in the population and the ease with which they can be detected have greatly increased the number of potential markers.

The new molecular genetic methods have yielded the greatest success for rare mendelian disorders for which the mode of inheritance was known and the phenotype clearly specified, as in cystic fibrosis and Huntington's disease.[6] For conditions like Huntington's, it is now possible to localize disease loci without knowledge of the pathophysiology of the disease and to develop a screening blood test for the disease without identifying the actual disease gene.

Seemingly contradictory findings have been emerging from linkage studies of bipolar affective disorder. The early bipolar linkage studies using phenotypic markers suggested that some bipolar families with no male-to-male transmission had an X-linked single-gene disorder.[7] In 1987 there were two reports of linkage of bipolar disorder to markers on the X-chromosome, one of which was based on RFLP markers[8] and the other on G6PD deficiency and color blindness.[9] However, other families without male-to-male transmission that were informative for one of these markers failed to show linkage;[10,11] in addition, many families were noted to have male-to-male transmission.

In 1987 Egeland and her group[12] reported finding linkage in an Old Order Amish family with bipolar disorder to RFLP markers on the short arm of chromosome 11. Since the initial study, clinical follow-up on members of the core pedigree has revealed that two previously unaffected indiviuals subsequently became ill.[13] These two recombinants dropped the LOD score below the level of significance. Genetic re-evaluation of the core pedigree including 10 members who had previously been incompletely genotyped decreased the LOD score even further, as did extending two branches of the family.

There has been been a recent report of a family in which affective disorder is co-segregating with a balanced 9/11 chromosomal translocation.[14] Chromosome analysis revealed that the breakpoint on chromosome 11 was at 11q22.3 and that the 11q23-11qter was translocated to chromosome 9p22. This finding is of considerable interest since the dopamine D2 receptor, a major site of action of neuroleptic medications used in the treatment of affective disorders and schizophrenia, recently has been mapped to the 11q22.3-11q23 junction.[15]

Linkage of bipolar disorder to a locus on chromosome 6 also has been reported in a set of small families,[16] but the finding has not been replicated.

These seemingly contradictory findings point out some of the major problems in doing linkage analyses in the major psychiatric disorders, particularly the affective disorders.

Difficulties in Genetic Linkage Research

The *lack of clear-cut mendelian patterns of inheritance* has impeded linkage studies in bipolar disorder. Studies to date indicate the bipolar disorders are probably a mix of oligogenic and single-gene forms. Currently linkage analyses are useful for studying only the single-gene forms.

Heterogeneity (a single phenotype being caused by any one of several genes) creates a major problem for linkage analyses since evidence in favor of linkage to a particular locus in several of the families may be canceled out by evidence against linkage at that locus in other families in which bipolar illness is associated with a different locus. The traditional approach used to deal with heterogeneity has been to study one large family. Using one large family, one may be able to find one locus associated with the condition, but it involves a great deal of work to find one, possibly rare, locus. Experience with the Old Order Amish family has shown that even this approach is fallible.

An alternative approach to the problem of heterogeneity is to study a set of small families with multiple affected individuals using a linkage map of DNA markers (RFLPs). In 1987 a useful linkage map of 403 polymorphic markers (including 393 RFLPs), which linked to 95 percent of the DNA in the human genome, became available.[17] Since then, many other informative, mapped RFLP markers have become available. Using new analytic methods such as simultaneous search and interval mapping[18] together with a

linkage map, it is possible to search simultaneously for several linked loci in a set of small families with multiple affected members.

Our linkage study of bipolar disorder, which began three years ago, was designed to create a clinical resource of 50 small families with a structure particularly informative for linkage studies: a treated BPI proband; two or more sibs affected with either BPI, BPII, or recurrent major depressions; two living parents, at least one of whom is unaffected; and sufficient other relatives to establish the phase of the markers. To find such families, we have screened the inpatient units, day treatment center, and outpatient clinics at the Phipps Clinic of The Johns Hopkins Hospital and the Francis Scott Key Medical Center. Our consultants in Iowa have screened the inpatient unit at the University of Iowa Psychiatric Hospital.

We are working in collaboration with Dr. Donis-Keller, now at Washington University, who has genotyped several of our families and found no evidence of linkage to the H-ras and INS loci on the short arm of chromosome 11.

Assortative mating,[19,20] another major problem encountered in linkage studies, refers to the marriage of two individuals with major affective disorders more often than would be expected by chance. This phenomenon results in two-sided families, that is, with affective disorders in both parental lines. Assortative mating may introduce two different disease genes into a family and presents a problem for linkage studies, which are efficient at detecting only one disease locus per family. Even if one is studying one large family, there may be some branches of the family that cannot be used without destroying the evidence for linkage if there are affected by affected matings.

In our linkage study, we have screened approximately 1,000 bipolar pedigrees. Most were excluded because they had insufficient numbers of affected members or unsuitable probands, or were obviously two-sided. After a second level of screening, we identified 45 apparently suitable families. Further evaluation revealed that 22 of these families were either uncooperative or unsuitable, leaving us with 23 families, half of whom appear to be clearly one-sided. To facilitate the exclusion of two-sided families, we interview the parents as soon as possible after a potentially suitable proband has been identified.

Aspects of our design may have increased the number of two-sided families we have been finding. Our requirement of three or more affected sibs may have biased our sample towards two-sided families. By recruiting the majority of the probands from the Johns Hopkins Hospital, we may have been selecting from a patient population biased toward the severe forms of the illness that are often the outcome of affected matings. We are making changes to address each of these issues.

Establishing the phenotype is critical to the success of any linkage study. Clinically, although severe cases are easily and reliably diagnosed, there is no clear separation between mildly affected and unaffected individuals. The formulation of specified diagnostic criteria has been associated with a substantial increase in the reliability of the direct assessment of affective disorders. In our bipolar study, clinical diagnoses are based on data from a structured interview: the Schedule for Affective Disorders and Schizophrenia-Lifetime version (SADS-L),[21] hospital records, and information from treating psychiatrists and family members. Diagnoses are made in accordance with the Research Diagnostic Criteria (RDC).[22] Prior to beginning our study we demonstrated good interrater reliability using the SADS interview and RDC with patients with a variety of diagnoses.

Diagnoses for all family members interviewed are reviewed by two psychiatrists other than the interviewer. If a consensus diagnosis cannot be reached for a case, that individual will not be included in the analyses. Consideration is given to severity factors such as number of symptoms, number of recurrences, and treatment history which for affective disorders have been shown to indicate stability of the diagnoses.[23]

Diagnosing an unaffected individual as affected (false positive) decreases the power of the linkage analysis method. Thus the diagnosticians must have a high threshold for calling a case. Patients with an uncertain phenotype should be excluded from the analyses and followed up at regular intervals to determine whether their status has changed to that of a case. For the same reason, every attempt must be made to screen out nongenetically caused cases, phenocopies that may be due to endocrine disorders, neurological disorders such as strokes and Parkinson's disease, and to pharmacological agents (for example, steroids, L-Dopa, and reserpine).

Diagnosing as unaffected someone who actually has the gene (false negative) usually results from lack of expression of the gene (incomplete penetrance). This can be corrected for by entering an estimate of penetrance into the linkage analyses.

Phenotyping and genotyping must be done independently to prevent either aspect of the study from being biased by the other.

Lack of replication has plagued linkage studies in affective disorders. Since this may be due in part to the variability among studies in the methodologies used, guidelines for conducting these studies have now been developed.[24]

Future Directions for Studies

Findings to date indicate that the genetics of bipolar illness are much more complicated than had been anticipated and that single-gene transmission may account for a small proportion of all cases compared to mutiple-gene forms. While this indicates we are still at a preliminary stage in unraveling the genetics of bipolar disorders, there are reasons for optimism.

One promising strategy is to look for linkage to candidate genes such as those for tryptophan and

tyrosine hydroxylase (enzymes involved in the formation of the neurotransmitters serotonin and norepinephrine that help regulate mood) and the dopamine D2 receptor, all of which have been localized to chromosome 11.

More resources are being devoted to genetic research into psychiatric as well as other disorders. The National Institute of Mental Health has funded a new genetics initiative for bipolar disorder, schizophrenia, and Alzheimer's disease. The four centers studying bipolar disorders will collect a total of 265 families, which should increase the likelihood of finding other loci that are linked to bipolar disorders.

An exciting new venture is the Genome Project whose mission is to sequence the entire human genome. This huge enterprise, which is projected to cost $3 billion over the next 10 years, will facilitate the mapping and isolation of genes and will lead to cloning of genes to determine the gene products, a prerequisite to devising rational treatments.

At some point in the future *all* the genetic subtypes of bipolar disorder will be identified. Perhaps in the not-too-distant future, the loci for the *most commonly occurring single-gene forms* of bipolar disorder will be found and those genes isolated and cloned, making early and accurate diagnosis and rational treatment a reality for many bipolar patients.

Although there has been enormous improvement in the safety and accuracy of our diagnostic approaches and in the precision and safety of our surgical techniques, the long-term survival of patients with malignant brain tumors remains dismal.
With an increased understanding of the fundamental biologic characteristics of brain tumors, we should be able to improve the outlook for these patients.

Progress has been made in the evaluation, diagnosis, and treatment of patients with brain tumors. Although Harvey Cushing joined the Hopkins staff in 1901, he did not perform his first brain tumor operation until 1905.[1] The first skull x-rays were performed in approximately 1900. Most of Cushing's intracranial operations were exploratory and palliative, and he had to rely on clinical judgment for localization. By applying Halsted's meticulous surgical techniques, Cushing reduced the mortality of intracranial tumor operations from 85 percent to approximately 10 percent.

Walter Dandy, Cushing's successor, developed pneumoencephalography to better localize lesions and demonstrated that many brain tumors could be cured by total resection rather than merely palliated by decompressive operations.[2] The introduction of glucocorticoids into neurosurgical practice in the late 1960s brought the neurosurgical operative mortality down from 30 percent to its current rate of less than 1 percent [3] During the past decade there has been enormous improvement in the safety and accuracy of our diagnostic approaches and in the precision and safety of our surgical techniques, which certainly lead to improved quality of life for patients with brain tumors. Nonetheless, we have not yet been able to affect the biology of the malignant brain tumor behavior; and, therefore, the long-term survival of patients with malignant brain tumors remains dismal.[4]

Diagnosis

The symptoms of most intracranial lesions are caused either by focal neurologic deficits due to the mass effect or by diffuse increased intracranial pressure. Signs and symptoms of increased intracranial pressure include headache (the presenting symptom

of approximately one-third of the patients with a brain tumor), nausea, vomiting, diplopia due to palsy of the trochlear or abducens nerves, and papilledema. The premier signs of increased intracranial pressure are altered mental status, lethargy, and obtundation. The headaches are characteristically worse in the morning because of differences in cerebrospinal fluid (CSF) circulation between the supine and upright positions. There is often a regional correlation to the headache, especially with frontal tumors causing frontal headaches and occipital lesions causing occipital or posterior cervical pain. This may be due to local stretching of pain fibers in the dura. There is an urgent need to begin treating patients who present with increased intracranial pressure.

A far better prognostic sign is a presentation with local symptoms, for example, seizures. Almost half the patients have experienced a seizure at the time of their first presentation. The seizure may be the focal Jacksonian type, which aids in localization, or the generalized grand mal type. Often, the first seizure is a momentary loss of alertness and may be ignored by the patient. Other focal signs observed in patients with supratentorial hemispheric tumors include personality changes, weakness, sensory loss, visual deficits, hearing changes, anosmia, speech deficits, memory deficits, and other defects in mental functions.

An important characteristic of the symptom complex in the patient with a brain tumor is the *relentless progression* of the symptoms and signs, which correlates with continued tumor growth.

The evaluation of a patient with a suspected tumor begins with a detailed history and neurologic examination. Approximately half the patients with a brain tumor have one of the following findings at the time of presentation: hemiparesis, hyperreflexia, cranial nerve palsy, mental alteration, or papilledema. The level of consciousness determines the urgency of work-up and treatment. The disoriented patient or one with a declining level of consciousness requires immediate evaluation and treatment to lower the intracranial pressure.

Adjuncts to the physical examination include visual field testing. This is useful in that the visual fibers can be specifically affected by local lesions in each of the cerebral lobes. Electroencephalography (EEG) is useful in managing patients who have seizures. In general, brain tumors produce a regional slowing of electrical activity. However, a specific epileptogenic focus may produce spikes or spike and wave foci. Examination of the CSF by lumbar puncture carries significant risk and should be performed only when intracranial mass effect or increased intracranial pressure has been definitively ruled out by neurologic examination and computed tomography (CT) scan or magnetic resource image (MRI). The primary indication for examination of CSF is to rule out meningitis or for evaluation of subarachnoid hemorrhage. CSF protein above 40 mg per dl is highly suggestive of a tumor, although it can be a consequence of bleeding or infection. Tumors may lower CSF sugar as do infections or viral encephalitis. CSF Millipore filtration for cytology as well as tissue culture are useful for the diagnosis of tumors in the CSF. Tumor markers such as alpha-fetoprotein, human chorionic gonadotropin (hCG), polyamines, and angiogenesis factor are useful for following tumor response to treatment.

Radiographic evaluation of the patient with a suspected brain tumor may begin with a CT scan or MRI. The CT scan demonstrates the configuration of the lesion, its relative vascularity and calcification, and its effects on surrounding structures. The edema and consequent mass effect also can be evaluated. The presence of increased intracranial pressure or hydrocephalus is also observed.

CT scans can be obtained in axial and coronal directions to better localize the tumor for surgical intervention. By marking the scalp while the patient is in the CT scanner, the topographic localization can be pinpointed. Three-dimensional images using multiplanar reconstruction are useful for surgical planning and for follow-up of therapeutic effects. Dynamic CT scanning, whereby a pulse of constant dye is injected with rapid sequential scanning, is useful for determining the vasculature of the tumor and for ruling out the presence of vascular lesions mimicking a tumor. A low-grade, well-differentiated astrocytoma occasionally may not be apparent on routine CT scanning. It is therefore necessary to follow some patients with sequential CT scans if their symptoms continue to develop. MRI with and without gadolinium enhancement is the most sensitive and precise method for tumor detection and delineation of the vasculature. Vascular lesions such as stroke often mimic the mass effect seen with brain tumors. These can be differentiated by sequential CT scans or MRIs. Strokes tend to resolve within a few weeks, whereas tumors progressively worsen.

Magnetic resonance imaging is playing an increasing role in the evaluation of intracranial lesions. MRI is frequently more accurate than CT scanning in defining distinct borders of lower-grade astrocytomas. This has led to an improvement in the ability to surgically resect low-grade astrocytomas. Spread of edema to the opposite hemisphere appears to signify a poorer prognosis.

Positron emission tomography (PET) scanning, while still experimental, holds the additional promise of using radioisotope-labeled metabolically active substances (for example, glucose or methionine) to evaluate the functional activity of a tumor.[5] Nuclear magnetic spectroscopy also holds the promise of evaluating the metabolic activity of a brain tumor, not just its structural anatomy.[6]

Cerebral angiography is only occasionally necessary. Its major role is to outline the detailed vascular supply to a tumor as an aid to surgical intervention.

Surgery

Despite the advances in diagnostic techniques, the

definitive diagnosis of a brain tumor cannot be made without pathologic examination of the tissue. The surgical goals are to remove as much tumor as is safely possible without creating a new neurologic deficit. In addition, if the tumor infiltrates through the frontal, temporal, or occipital lobes, a partial lobectomy may be beneficial for decompression. The intraoperative use of the microscope, laser, and ultrasonic aspirator have further improved the ability to remove tumors while preserving normal neurological function. In selected cases, an indwelling subdural electrode array can be implanted to physiologically define functional areas of brain before the definitive operation for the brain tumor is carried out. The neurophysiological data allows an aggressive neurosurgical attack while minimizing the risk of producing functional deficits.

Hydrocephalus can be relieved by either ventricular drainage or an internal shunt. For tumors located in a critical area of the brain (for example, the speech area or motor strip) or for deep-seated lesions, an open biopsy may be done through a small craniotomy with direct observation of the tissue to be resected.

A useful adjunct to surgical biopsy is intraoperative ultrasound. With this technique, a cyst or mass can be identified and the biopsy needle observed directly. A further refinement in biopsy technique is the stereotactic CT-guided biopsy. This approach is useful for deep-seated lesions located in critical areas.[8] The techniques are now so refined that a specific area of CT enhancement can be identified for biopsy.[9]

All surgical patients are treated prophylactically with antiseizure medication, usually phenytoin or phenobarbital, as well as with a corticosteroid, usually dexamethasone, 4 mg every 6 hours. If there is significant mass effect, the dose of steroid is increased. Appropriate antacids and H2 blockers are used with the steroids. One week after the operation, the steroid doses are tapered slowly and eventually discontinued, whereas the antiseizure medication generally is continued indefinitely.

Reoperation is reserved for patients who have benefited significantly from their prior surgery, are in good neurologic condition, have a local recurrence, and are not easily managed with steroids alone. Reoperation in these selected cases can significantly prolong both the length and quality of survival and may allow adjuvant therapies to be more effective.[10,11]

Stereotactic radiosurgery is now possible and allows for precise irradiation of small well-localized lesions.

Adjuvant Therapy

For malignant tumors, surgical therapy is followed by approximately 6000 cGy of radiation therapy. For patients with malignant gliomas, surgery plus radiation therapy improves the median survival from 14 weeks with surgery alone to 36 weeks. The addition of intravenous chemotherapy with either 1,3-bis-(2-chloroethyl)-1-nitrosourea (BCNU) or methyl-1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea (methyl-CCNU) does not significantly change median survival but does dramatically increase the proportion of patients surviving more than 18 months (27.2 percent with surgery, radiation therapy, and BCNU versus 4 percent for surgery and radiation therapy or BCNU alone).

Experimental Therapy

A variety of experimental protocols are available for malignant gliomas. Their efficacy remains to be determined.

Interstitial radiation currently is used to treat tumor recurrences.[12] This therapy is associated with a high percentage of patients suffering radiation necrosis to the surrounding brain. Reoperation commonly is required, but this complication is partially offset by the increased survival of these patients. Other experimental protocols involve intra-arterial chemotherapy, immunotherapy, hyperthermia, photoradiation, and manipulation of the blood-brain barrier.

At Johns Hopkins Hospital patients are offered a variety of experimental protocols to treat malignant gliomas. After maximal surgical resection, two cycles of a three-day infusion of cisplatinum and BCNU are given prior to radiation therapy. Recurrences are being treated with carboplatinum, a platinum derivative with less neurotoxicity and better brain penetration.

An entirely new method of drug delivery to the brain is being evaluated:[13-14] a biocompatible, biodegradable polymer (polyanhydride) delivers chemotherapy to the brain. A Phase I study involving 21 patients at five medical centers showed these polymers were safe when implanted at the time of surgery.[15] A prospective placebo-controlled randomized study is under way to determine if this method can effectively deliver high doses of BCNU chemotherapy while minimizing systemic exposure. Such an approach opens the door for targeted therapy to specific locations in the brain.

Summary

Thus, there have been enormous changes since Cushing's time in our ability to evaluate and treat brain tumors. While these advances have allowed cures for patients with benign brain tumors, they have not yet changed the long-range outlook for patients with malignant lesions.

Newer approaches, such as the development of new chemotherapeutic agents, immunotherapeutic agents, biological response modifiers, drugs that could inhibit neovascularization of tumors, or better methods of drug delivery, need to be developed and tested. With an increased understanding of the fundamental biologic characteristics of brain tumors, we should be able to improve the outlook for these patients.

A MESSAGE FOR THE HEARING IMPAIRED

The Resound Hearing Aid, using the technology developed by ATT-Bell Lab and Rodney Perkins, M.D. (Stanford University) is a hearing device of unsurpassed cosmesis and quality. For those who qualify, this device provides superior performance, comfort and acceptance when compared to all the existing electroacoustic devices for the hearing impaired. A digital hearing aid using the Texas Instruments TM 532020 digital signal processor programmed specifically for the hearing aid user to match their individual need.

The device is implanted through a minor recontour surgical procedure of the ear done under local outpatient surgery. Following this the high performance sound processing device is placed deep in the ear canal near the ear drum. The procedure is now being done at Harbor Hospital in Baltimore, Maryland.

The Resound has the ability to compensate for the distortion of sound recruitment common to regular hearing aid users. The Resound adjusts the intensity for each frequency to fit into the individuals comfortable hearing range. Thus, the distortion with high tones of speech, the loss of consonants and indistinctness of speech, the loss of directionality and the wind noise are practically eliminated with the Resound. The programming of the device is done by Dr. Kathryn Copmann, Ph.D. audiologist and the evaluation and implantation is done surgically by Otolaryngologist Lewis B. Newberg, M.D.

To date the patients that have been seen and operated on are all quite satisfied with the quality of sound; and cosmetically were quite surprised and pleased.

In addition to being able to offer the Resound Hearing device, a number of additional services are available including transtympanic and operative electrocochleography for Menieres disease and Audiant bone conduction hearing devices and cochlear implants. A full range of rehabilitative ancillary support are available for those who diagnostically qualify for these procedures.

Tumors of the Skull Base

Don M. Long MD, PhD and Douglas E. Mattox MD

From the Center for Skull Base Surgery, The Johns Hopkins Medical Institutions, Department of Neurosurgery and Otolaryngology/Head and Neck Surgery.

Recognition of the many benign and malignant tumors that occur in the skull base is now simple, given three-dimensional CT scanning and MRI with enhancement. Recent developments in surgical technique have allowed these tumors to be approached, but only in the past two to three years has radical surgery been possible.

It is traditional to divide tumors of the skull into those which are primary and secondary and to further divide these categories into benign and malignant. Primary benign tumors of the skull are chondroma, osteoma, and giant cell tumor. Primary malignant tumors include chondrosarcoma, osteogenic sarcoma, fibrosarcoma, and giant cell tumor. Chordoma can be considered benign or malignant. More common tumors include meningiomas, tumors of the pituitary, and tumors of the glomus jugulare, and schwannomas of the acoustic nerve. Malignant secondary tumors are nearly all metastatic or invasive from the nasopharynx or paranasal sinuses.[1]

A group of unusual diseases simulate skull/base tumors including osteopetrosis, Paget's disease, mucocele, and fibrous dysplasia.

Many lesions are classified according to their radiographic appearance. It is traditional to describe them as osteolytic or radiolucent, osteoblastic or sclerotic, and mixed. Osteolytic lesions are chondroma, giant cell tumor, chondrosarcoma, osteogenic sarcoma, chordoma, meningioma, glomus jugulare tumor, metastatic carcinoma, and locally invasive carcinoma. Paget's disease, mucocele, and fibrous dysplasia also present with radiolucency. The osteoblastic lesions are osteoma, meningioma, metastatic carcinomas, osteopetrosis, Paget's disease, and fibrous dysplasia. Mixed lytic blastic lesions include osteogenic sarcoma, meningioma, metastatic carcinoma, Paget's disease, and fibrous dysplasia.[1,2]

Primary Benign Tumors

Chondroma Chondromas are tumors of young adults and occur equally in the sexes. Most occur in the nose or paranasal sinuses. Typically these present with sinus-related symptoms. The more unusual spheno-occipital lesions typically extend into the parasellar area or the cerebellopontine angle. They may mimic meningiomas of the medial sphenoid wing and present with extra-ocular muscle palsies, trigeminal pain, and proptosis. Tumors of the

cerebellopontine angle cause 5th, 7th or 8th nerve dysfunction. Lower cranial nerve palsies characterize tumors that occur around the jugulare bulb.

Imaging studies demonstrate a lytic lesion with sharp margins and stippled calcification within. Treatment of these tumors is total surgical removal. A few will undergo malignant degeneration.

Osteomas Osteomas most commonly are found in the paranasal sinuses. The osteomas that arise from the skull base usually project internally and produce symptoms by compression of adjacent neural structure. By x-ray the osteoma is a well-defined, smoothly homogeneous increased bone density. The treatment is extensive surgical removal.

Giant cell tumor Most giant cell tumors are found in the mandible, and a few are of bone destruction. The treatment of choice is local excision. There is apparently considerable overlap between benign and malignant forms. Radiation therapy may produce sarcomatous degeneration and is not used except for obviously malignant tumors.

Primary Malignant Tumors

Chondrosarcoma These tumors usually present in adult life and most frequently occur in the skull base. Pain is the most common complaint, and the history is often very long. The tumors may be large before they are found, and metastases are frequent.

X-ray demonstrates irregular and poorly defined bone destruction. CT or MRI may show a soft tissue component, and there are often stippled calcifications within the area of bone destruction.

Radical surgical resection is the treatment of choice, and if margins are obtained, a cure is possible. X-ray therapy is recommended if resection is incomplete.

Osteogenic sarcoma This common primary malignant tumor is extremely rare in the skull. It occurs in young adults, though it may complicate late Paget's disease or occur following radiotherapy. These tumors grow rapidly, and local pain is the most common problem. Early lung metastases are common.

Osteogenic sarcoma can be recognized as a large lytic lesion with poorly defined margin and a sun ray appearance of bony spicules. The treatment is radical resection, followed by radiation therapy. The prognosis is extremely poor, and long-term survival is less than 10 percent.

Fibrosarcoma These rare tumors produce irregular lytic lesions that destroy a well-defined area of the skull base. The appropriate treatment is radical surgery, followed by radiation. Long-term survival is the rule, in contrast to osteogenic sarcoma.

Chordoma Chordomas arise from notochordal remnants in the clivus. They occur in the third or fourth decade, and most are spinal tumors. About 30 percent occur at the cranial base. A significant number metastasize: the average survival of the patients with untreated tumor is 30 months. The most common clinical symptom is local pain. Cranial nerve involvement is also common, and compression of the brain stem may occur.

The characteristic picture on plain x-ray is destruction of the basisphenoid. Adjacent bone may be sclerotic. There may be a large soft tissue mass. Computerized tomography (CT) scan is best to demonstrate the bony abnormality. Magnetic resonance imaging (MRI) enhanced with gadolinium is the best way to visualize the soft tissue component of the tumor.

The treatment of basisphenoid chordomas is frustrating. Local recurrence is the rule, and all therapy has been palliative. The best approach now is radical surgery. (While the role of radiation therapy is unclear, heavy particle radiation is under trial.) Surgery extends the life of patients from 30 to 55 or 60 months. Our current procedure of choice is a radical transfacial or translabio-glossal-pharyngeal approach with maximum effort to remove as much tumor as possible at the first operation. The major issue in surgery is to avoid injury to cranial nerves.

Intracranial Tumors Secondarily Involving the Skull Base

Tumors of the glomus jugulare Tumors in the region of the glomus jugulare are similar to the paragangliomas that occur elsewhere in the body. They arise in relation to chromaffins cells in the jugular bulb and/or in the ear. Over half appear to be restricted to the middle ear. These are called Class 1; Class 2, 3, and 4 tumors involve the bone locally around the jugular bulb. Class 5 tumors extend into the petrous bone, and Class 6 tumors are those large enough to extend across the midline of the skull.

Patients present with a variety of complaints. Hearing loss is the most common. Pain in the ear and tinnitus are frequent. Progressive involvement of lower cranial nerves may occur early. When there is a significant intracranial mass, gait disturbance, ataxia, nystagmus, and increased intracranial pressure or hemiparesis may occur.

The physical examination frequently discovers a bruit. A bluish mass may be seen in the ear, and neurological examination usually demonstrates cranial nerve findings from 5 through 12 in various combinations.

Imaging studies demonstrate enlargement of the jugular foramen and in associated erosion. The soft tissue mass is best seen with MRI. Angiography is reserved for therapeutic embolization and is not required for diagnosis.

Radical surgery is the appropriate treatment for these tumors, and most can be cured with one or more operations. For all tumors large enough to extend intracranially, we employ a two-stage operation. At the first stage, the posterior fossa is opened, though the tumor is not removed. A fascial graft is taken from the leg and used to cover the tumor. Cranial nerves and blood vessels are isolated on the inside of the graft and

the tumor is then external. This false dura will produce a seal of cerebrospinal fluid and protect the brain stem, cranial nerves, and intracranial vessels from the definitive surgery to remove the tumor. Approximately one month after the first-stage operation, the patient undergoes angiography and the feeding vessels of these vascular tumors are embolized. The following day the patient goes to the operating room, and a lateral extradural approach is used to completely remove the tumor.[3]

The outcome of this surgery is encouraging. Occasionally small residuals cannot be identified, and reoperation is required to remove additional or recurrent tumor. Radiation therapy may be useful to prevent recurrence.

Because these tumors have a great propensity to recur, even with apparent gross total removal, we continue regular scans for an indefinite period.

Meningiomas of the skull base Meningiomas occur from the anterior fossa to the foramen magnum along the midline. The most common compress the anterior visual apparatus, and the next most common group occur on the upper clivus, near the posterior clinoid process. Most symptoms relate to compression of the cranial nerves where the tumor is located. Those meningiomas occurring around the anterior visual apparatus present with painless progressive visual loss or paralysis of one or more extraocular muscles (see Figure 1). Tumors of the upper clivus present with trigeminal pain or sensory loss in the face, extra-ocular muscle palsies, and paresis of one or both lower extremities. This may be subtle, and a gait disturbance may be the only finding (Figure 2). Meningiomas that occur in the cerebellopontine angle cause abnormalities of 7th and 8th nerve function, while those that occur lower near the jugular bulb usually present with pain and deficits of 9, 10, 11, and 12th cranial nerve function. These tumors can grow to enormous size before they are detected.

MRI with gadolinium is diagnostic in virtually all patients. The decision-making process for treatment of these meningiomas is often difficult. They frequently occur in elderly patients. Enormous tumors can have minimal symptoms and do not necessarily require treatment. We generally do not operate on these tumors simply because they are found. Tumors requiring treatment usually cause more or progressive symptoms and usually are found in younger individuals.

The best current therapy is radical surgical removal. Cranial nerve deficits, even long-standing, frequently can be relieved. Many of these tumors can be cured by radical surgery without lasting deficit. Those tumors that envelop cranial nerves or surround blood vessels may not be curable. Particularly in elderly individuals, palliation by subtotal removal is the best and safest course for the patient. X-ray therapy is then used to control any residual tumor. The x-ray therapy can be given immediately after surgery, or it may be withheld until there is some evidence of tumor regrowth.[1]

Schwannomas of the acoustic nerve The typical cerebellopontine angle tumor is the acoustic schwannoma often miscalled acoustic neuroma. These tumors occur in all age groups and are a common cause of progressive hearing loss. With the high-quality imaging now available, there is no reason for such tumors to be missed. Any patient without an obvious otological reason for unilateral hearing loss should be imaged by MRI with gadolinium. The tumors appear as brightly enhanced areas, and the diagnosis is virtually certain.

As these tumors grow, paresis of the face secondary

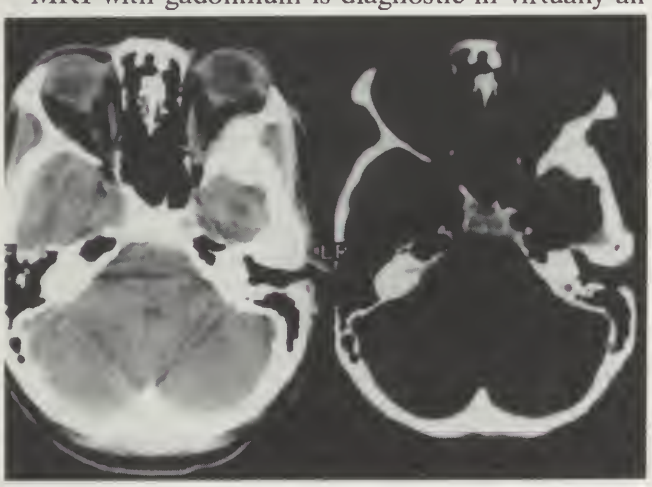

Figure 1. CT of skull base. Scan on the left shows striking overgrowth of left sphenoid bone producing proptoses. Bone window on right demonstrates the contrast in bone thickness; normal right and sclerotic left side. Treated by lateral pterygotemporal decompression.

Figure 2. MR of large basal meningioma (white mass) displacing brain stem and surrounding basilar artery. Total removal by posterior fossa route was possible.

to 7th nerve involvement may occur. Extension of the tumors will produce hypesthesia of the face and loss of 9, 10, 11, and 12th nerve function. When the tumors grow large enough to compress the brain stem, contralateral hemiparesis may occur, and unilateral cerebellar dysfunction will develop late in the course of untreated tumors.

These tumors come in many different sizes. Since the natural history of the tumors is one of steady growth, when discovered their treatment is usually indicated. This is not necessarily true for elderly patients with small tumors. Such patients can be followed with regular scanning and surgery deferred until the tumor grows.

A special situation occurs in Von Recklinghausen's disease where bilateral tumors are the rule. Since preservation of hearing is not common after surgery, removal of both tumors means almost certain deafness. We usually try to remove the larger tumor and preserve 8th nerve continuity so that a hearing aid can be used. The second surgery is withheld until the tumor begins to impair hearing seriously or grows to be a threat to life and function. During the interval, it is important the patient learns the appropriate communication techniques for the deaf.

The surgical procedure and the outcome for the patient are predicated upon tumor size. There are three basic approaches:

1. *Middle fossa* This surgical procedure is done by a small temporal craniotomy that exposes the petrous bone. The area over the tumor is drilled away and the tumor removed. Used for very small tumors, this approach has the possibility of saving hearing.

2. *Translabyrinthine* Used for tumors of all sizes, this operation is particularly effective for small and medium tumors. The petrous bone is removed by drilling, much as in mastoidectomy. The tumor is then removed. The operation has the virtue of being relatively nontraumatic to the patient since literally no cerebellum or brain stem area is exposed. On the other hand, hearing always is sacrificed because of the removal of the petrous bone and its contents. We reserve this approach for elderly patients with small or medium tumors and younger patients who have lost hearing.

3. *Posterior fossa* The traditional neurosurgical operation is through the posterior fossa. The approach is unilateral. The cerebellum is retracted, and the tumor can be exposed with a real but small risk of neural injury. The goal is total removal.

Intracapsular removal for palliation Occasionally, in an extremely large tumor, especially in an elderly patient, it is wiser not to carry out gross total removal of the tumor, but to remove the majority of the tumor leaving the capsule intact. This decreases the risk of cranial nerve injury and eliminates the need for dissection of tumor from brain stem and major vessels. Recurrence probably will occur, but reoperation with intracapsular removal is quite safe and can be repeated as necessary.[3]

Outcome of Acoustic Tumor Surgery

In the not-too-distant past, surgery of the acoustic tumor was dangerous and nearly always associated with permanent loss of 7th nerve function. The advent of microsurgical techniques and better instrumentation has essentially eliminated the major risks. In over 400 cases using our current approaches, we have had no surgical deaths. Injury to brain stem or blood vessels supplying the brain stem used to be a catastrophic occurrence that regularly complicated surgery for large acoustic tumors. One patient became permanently hemiplegic following an apparently uneventful removal of an acoustic tumor. Injury to the anterior/inferior cerebellar artery is the usual postulated cause.

The major risks to patients are cranial nerve dysfunction. Fifth nerve dysfunction on a permanent basis is extremely rare. No patient in our series has a significant residual dysfunction. Loss of 7th nerve continuity used to be virtually certain with all operations, now it is rare. We have deliberately divided the nerve to obtain a total tumor removal or been unable to preserve its continuity during tumor dissection in between 2 and 3 percent of patients. This has occurred only with the largest tumors, and primary repair of the 7th nerve has brought about recurrence of function in over half these patients. Temporary 7th nerve dysfunction is much more common and may occur in as many as half of patients with large tumors. It is much less common with smaller tumors. While recovery is the rule, it may require weeks to many months. In elderly patients, recovery may take a year or more.

Hearing loss is the major consequence of removal of these tumors. Patients who are deaf almost never have any hearing restored. It is occasionally possible to save functional hearing with smaller tumors but very rarely with larger tumors. However, we advise patients to expect deafness following surgery. Preservation or restoration of hearing is the major challenge for new developments in surgical technique. Vestibular dysfunction almost always occurs, but it is improved by therapy, rarely lasting more than a few months except in elderly patients. Deficits of 9th, 10th, 11th, or 12th cranial nerve functions are not uncommon following removal of large tumors because these nerves often are distorted and compressed by the tumor mass. However, recovery is the rule, and we have no patient with a permanent palsy of one of these nerves.

Rarely, the 4th cranial nerve will be adherent to the top of a large tumor. Injury to the nerve may cause diplopia. This is extremely rare, and we have no patient in whom it has been permanent.

Stereotactic radiosurgery offers a new approach to these tumors. Tumors of no more than 2 cm to 3 cm could be irradiated by this technique. The outcome for such patients is uncertain, and the technique is being explored and evaluated in a number of centers.

Cure is now the rule for acoustic tumors. Nevertheless, to be certain that recurrence does not occur, we

scan these patients at yearly intervals for five years and then once every several years thereafter. As yet, we have not had a recurrence in a patient with an apparent total removal.

Radical Operations for Skull Base Tumors

Anterior approaches to the skull base include a radical combined craniotomy and transnasal procedure, the transseptal/transnasal approach to the pituitary region, and midface degloving.[3,4]

Radical surgery for lesions of the anterior skull base This radical operation is used for sinus carcinoma usually involving the ethmoid sinuses. Two teams of surgeons carry out a large bifrontal craniotomy and a transnasal approach to the sinus. The neurosurgical team resects the tumor intracranially, and the entire mass is removed through the nose by the head and neck surgery team. This combined operation has greatly improved the cure rate for these malignant tumors.

Transnasal/transseptal approach to the pituitary gland This is now the standard approach for pituitary tumors and tumors in the general area of the pituitary. The incision is made beneath the lip so there is no external scar, and the exposure is through the midline by removing the nasal septum. The sphenoid sinus is opened, readily exposing tumors of the pituitary area.

Midfacial degloving The midfacial degloving approach provides excellent exposure of the nasal and paranasal sinus cavities, the nasopharynx, rostrum sphenoidale, sella, and clivus. It can be combined with frontal craniotomy for tumors of the ethmoid and cribriform plate; however, invasion of the anterior ethmoid, frontal sinus, or orbit are indications for the more traditional craniofacial resection. The immediate advantages of the procedure include bilateral exposure and avoidance of external scars.

Midfacial degloving is ideal for lesions of the sphenoid, sella, planum sphenoidale, and upper clivus. Wide exposure of the nasal cavity is obtained by removal of the inferior turbinate and the party wall between the maxillary sinus and the nose (medial maxillectomy). This maneuver provides exposure of the entire ipsilateral nasal cavity, nasal septum, sphenoid rostrum, and clivus. If needed for full exposure of the tumor, an identical removal of bone can be performed on the opposite side, or the nasal septum can be reflected or resected to provide exposure of the contralateral nasal cavity.

Infratemporal fossa approaches The lateral infratemporal fossa approaches were developed for lesions of the temporal bone, infratemporal fossa, clivus, and parasellar region. The exposure is obtained by removing the bone of the temporal bone and bone at the base of the skull. The advantages of this approach are early identification and protection of the carotid artery in the temporal bone and skull base, and the exposure is extradural.

Fisch has divided the lateral approach to the skull base into Types A, B, and C, which provide progressively more anterior exposure of the skull base. The Type A approach is used for tumors of the temporal bone and jugular bulb, primarily glomus temporal tumors. The Type B approach extends the exposure to include the apical portion of the temporal bone and the clivus. The Type C approach includes the nasopharynx and parasellar region. The most important difference between these approaches is that the facial nerve must be mobilized and permanently transposed anterior for exposure of the jugular foramen (Type A), but it is left *in situ* in the Types B and C procedures.

All patients having obliteration of the middle ear space suffer a conductive hearing loss. Some transient weakness of facial movement is common (but not universal) after anterior transposition of the facial nerve. The cosmetic deformity is minimal since the zygomatic arch is replaced.

Craniofacial resection The indications for anterior craniofacial resections are benign and malignant tumors of the fronto-spheno-ethmoid region invading the anterior skull base. The prognosis is determined primarily by the histologic type and extent of the tumor; it is relatively good for well-differentiated epithelial tumors (adenocarcinoma, squamous cell carcinoma, esthesioneuroblastoma) and poor for anaplastic carcinomas and sarcomas. The resection can be combined with unilateral orbital exenteration, but invasion of brain parenchyma, extension within the pterygoid muscles, and distant metastases are considered contraindications to the procedure.

Midline labiomandibulotomy approach to the clivus (Trotter approach) The midline transoral approach is useful for extradural lesions of the clivus and upper cervical spine. The most frequent indications are craniocervical chordomas and structural spinal problems, including decompression of basilar impression, fusion of odontoid fractures, and decompression or rheumatoid myelopathy. Shortcomings of the transporal route include a long working distance to the surgical field and contamination of the wound by oral secretions intraoperatively and possibly postoperatively. However, recent advances, including microsurgical technique with long surgical instruments and modern methods of closure, have improved the safety and application of this approach.

Conclusions

Many benign and malignant tumors occur in the skull base. Their recognition is now simple, given three-dimensional CT scanning and MRI with enhancement. Recent developments in surgical technique have allowed these tumors to be approached for the first time in the past ten years, but only in the past two to three years has radical surgery been possible. The techniques evolved in a few centers are gradually spreading to be used by many surgeons. The basic approach to all these tumors is the same. Radical removal with decompression of neural and vascular

structures is necessary for symptomatic relief and for cure.

The malignant tumors kill by local recurrence, not metastases, in most instances. Complete removal of the malignant tumors is unlikely, and surgery is supplemented by radiotherapy.

Most benign tumors are relatively indolent, so even incomplete removal may result in prolonged palliation. The surgical techniques employed are uncommon. The skills of several different surgical disciplines are required for their satisfactory treatment. The Center for Skull Base Surgery at Johns Hopkins uses the team approach consisting of Neurosurgery, Neurotology/Head and Neck Surgery, Neuroophthalmology, and Plastic Surgery. Both surgery and anesthesia are long and tedious. Specialized anesthesia is important; most of these patients require a dedicated neurological intensive care unit. Patients often are ill for a significant period of time after surgery because of their cranial nerve deficits, and their respiratory care is critical. Nevertheless, the outcome for many is gratifying. The great advances in diagnostic imaging, anesthetic and surgical techniques, and postoperative care of the recent past have made surgery of skull base tumors a reality. Those tumors thought to be inoperable only a few years ago, can now be treated effectively with minimal mortality and reasonable morbidity. The skull base team concept has been central to evolving reasonable therapy for these hitherto untreatable tumors.[3]

Carcinoma of the Pancreas: Are We Making Progress?

John L. Cameron MD, FACS

From the Department of Surgery, The Johns Hopkins Medical Institutions, Baltimore. Dr. Cameron is the Warfield M. Firor Professor and Chairman, Department of Surgery, The Johns Hopkins University; and Chief of Surgery, The Johns Hopkins Hospital, Baltimore.

Over the past several decades no disease has frustrated clinicians more than carcinoma of the pancreas. At the time of diagnosis most patients have been unresectable. Recent reports suggest that when resection is possible, pancreaticoduodenectomy can be performed safely and survival extended by adjuvant therapy.

The incidence of carcinoma of the pancreas has increased threefold over the past 40 years. There are now 25,000 new cases diagnosed annually. This represents only 2 or 3 percent of all cancers, but because of its almost uniform fatality, it is the fourth leading cause of cancer death.

Only a few of the risk factors for carcinoma of the pancreas have been defined: males are more at risk than females; blacks more than whites. It is clearly associated with cigarette smoking. Diabetes, at least in the female, appears to be a risk factor. Chronic pancreatitis probably increases the risk of subsequently developing a carcinoma of the pancreas, but the role of alcohol and coffee have not been clearly defined.

Over the past several decades no disease has frustrated clinicians more than carcinoma of the pancreas. At the time of diagnosis most patients have been unresectable. Of those patients subjected to resection, the hospital mortality has been excessively high. Of the small number of patients with carcinoma of the pancreas who successfully underwent resection, virtually none survived five years. In addition, patients dying from the disease often had uncontrollable and severe abdominal and back pain; it has been a most difficult disease to manage. However, recent reports from Hopkins[1] and other institutions[2,3] suggest that when resection is possible, it can be performed safely and that following resection more patients are surviving longer periods.

Surgical Resection

The first successful resection of a periampullary carcinoma was reported in 1899 by Dr. William S. Halsted,[4] the first Chief of Surgery at The Johns Hopkins Hospital. A 60-year-old woman with obstructive jaundice was examined and found to have a small ampullary cancer. Dr. Halsted performed a local resection, the patient's jaundice cleared, and she lived approximately six months before dying from recurrent cancer.

The first successful pancreaticoduodenectomy performed in this

country for a periampullary carcinoma was reported by Whipple and his associates in 1935.[5] The operation was performed in two stages. The first stage consisted of a cholecystogastrostomy and a gastrojejunostomy to decompress the hyperbilirubinemia and to allow the patient's nutritional status to improve. During the second stage a small regional resection of the second portion of the duodenum and a part of the head of the pancreas was done.

The first one-stage pancreaticoduodenectomy was reported by Dr. I. Ridgeway Trimble, from Hopkins, in 1941.[6] In addition to performing the procedure in one stage, he advocated using the biliary tree instead of the gallbladder to restore biliary-enteric continuity.

The operative procedure evolved over the next several decades. By the 1970s a pancreaticoduodenectomy generally meant resecting the distal half of the stomach, all the duodenum, the gallbladder and distal biliary tree, and the head, neck, and uncinate process of the pancreas. Although many means of reconstruction are possible, the most common were an end-to-end pancreaticojejunostomy, an end-to-side hepaticojejunostomy, and a gastrojejunostomy.

During the 1960s and 1970s many physicians and some surgeons believed the pancreaticoduodenectomy should be abandoned for all periampullary carcinomas, and particularly for carcinoma of the head of the pancreas. The operative morbidity was excessive, and the hospital mortality in most series was in the range of 25 percent.

Recently, however, reports have documented that the excessive morbidity and mortality of this procedure have decreased and that now the operation can be performed safely.[1,2,3] Our experience with periampullary carcinomas at The Johns Hopkins Hospital clearly shows this trend (Table).

Between 1969 and 1980, 41 patients underwent a pancreaticoduodenectomy for a periampullary carcinoma. The mean operative time was nine hours, each operative procedure required over six units of blood replacement, and the hospital mortality was 24 percent. These operations were performed by 22 different surgeons. Between 1981 and 1986 dramatic changes occurred: 47 patients underwent a pancreaticoduodenectomy for a periampullary carcinoma; 30 percent of these had a pylorus-preserving modification, which obviated the need for a hemigastrectomy. Blood loss decreased significantly: the number of units of blood replaced dropped to 3.6. Operative time decreased to less than eight hours, and the hospital mortality dropped dramatically to 2 percent. This trend has continued to the present. Between 1986 and 1989, 55 additional patients have undergone a pancreaticoduodenectomy for a periampullary carcinoma. We are now performing the pylorus preservation modification in 80 percent of all procedures. Blood loss has decreased still further: now only one unit of blood is required per operative procedure. Operative time has decreased to below seven hours, and the mortality has remained less than 5 percent.

Table. Pancreaticoduodenectomy for Periampullary Carcinoma, The Johns Hopkins Hospital

	1969-1980	1981-1986	1986-1989
Patients	41	47	55
Pylorus preserving modification	0	30%	80%
Operative blood loss	3200 ml	1700 ml	800 ml
Operative blood replacement	6.3 u	3.6 u	1.1 u
Operative time	9.0 hr	7.8 hr	6.8 hr
Operations/year	3.4	7.8	18.0
Hospital mortality	24%	2%	4%

Several factors are responsible for this dramatic drop in hospital mortality. First, more pancreaticoduodenectomies are being performed each year. Between 1969 and 1980, less than four resections were performed each year. Between 1981 and 1986 this increased to eight per year, and now we are performing approximately 20 pancreaticoduodenectomies per year for periampullary carcinoma. In addition, a small number of surgeons experienced in pancreatic and biliary surgery are performing all the procedures. Other factors, including better nutritional support and better surgical intensive care units, have helped contributed to the decrease in hospital mortality.

It can now be said with certainty we have an operative procedure for patients with periampullary carcinoma that can be performed safely and that achieves adequate local control.

Long-Term Survival

In 1986 when the long-term survival for patients at The Johns Hopkins Hospital with periampullary carcinoma was examined, we were not surprised to find that patients who had undergone a successful pancreaticoduodenectomy for duodenal cancer, ampullary cancer, and distal bile duct cancer had a five-year survival in the range of 40 percent. It was surprising, however, to find that for patients with adenocarcinoma of the head of the pancreas, the five-year survival was 18 percent.[1] Previously most institutions in this country had reported five-year survivals of less than 5 percent, with most series having no five-year survivors. We recently extended our data evaluation to include 85 consecutive patients with adenocarcinoma of the head of the pancreas, and survival continues to be in the range of 20 percent.

Important factors in survival appear to be size of the primary lesion in the head of the pancreas, and the presence or absence of lymph nodes. If the primary tumor is less than 2 cm in diameter, five-year survival is clearly superior when compared to those patients with tumors greater than 2 cm in diameter. Lymph node status is even more important. Five-year survival approaches 50 percent in the absence of positive nodes

(Figure). If positive lymph nodes are present, five-year survival drops to less than 5 percent. An additional positive factor for long-term survival appears to be receiving two or fewer units of blood during the operative procedure. (Transfusions during the operative procedure have been found to adversely influence survival with other tumors as well.) Undoubtedly there are other factors responsible for the improvement in survival now seen for carcinoma of the head of the pancreas, but further data analysis will be necessary to clearly define them. Whether we are being more selective in performing pancreaticoduodenectomies on more favorable patients, whether the biology of the tumor has changed, or whether we are managing patients better is not clear. It is clear, however, that patients with carcinoma of the head of the pancreas who undergo a successful pancreaticoduodenectomy are surviving longer.

Adjuvant Therapy

One of the most exciting advances in recent years in the management of carcinoma of the pancreas has been the finding by the NIH-supported Gastrointestinal Tumor Study Group that adjuvant therapy can be effective in extending survival for patients who successfully undergo pancreaticoduodenectomy.[7] This important study demonstrated that survival time can be doubled if external beam radiotherapy and chemotherapy (5-FU) are given postoperatively. In those patients receiving adjuvant therapy post-pancreaticoduodenectomy, five-year survival was in the range of 15 percent, again confirming the impression from Hopkins and other centers that patients with carcinoma of the head of the pancreas are surviving longer following pancreaticoduodenectomy. This single study evaluating adjuvant therapy requires confirmation, but it is very suggestive that we may be entering an era in which adjuvant therapy will play an important role in managing patients with carcinoma of the head of the pancreas.

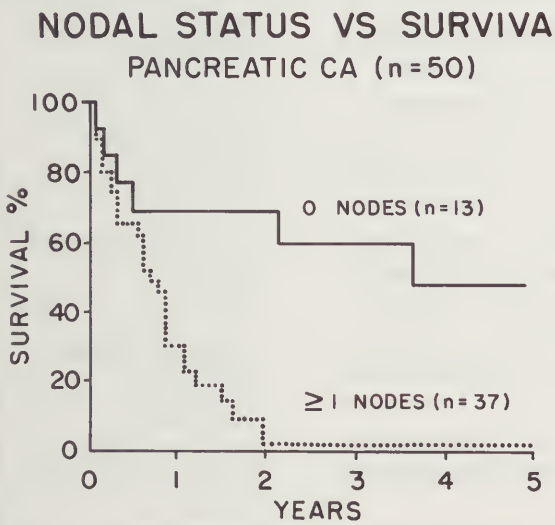

Figure. Five-year actuarial survival curves following pancreaticoduodenectomy for pancreatic cancer. Five-year survival approaches 50 percent when regional lymph nodes are negative but drops to below 5 percent when they contain tumor (Ann Surg 1987; 206:363).

Future Trends

It has taken over 50 years to learn how to do the operative procedure first proposed by Whipple, but the pancreaticoduodenectomy now can be done safely with a hospital mortality of less than 5 percent. In addition, it has proved to be a very effective operative procedure if performed before nodal spread. A challenge therefore will be to search for a tumor marker than can help identify larger numbers of patients with carcinoma of the head of the pancreas prior to regional nodal spread. Furthermore, the demonstration that adjuvant therapy can be effective in prolonging survival gives great hope for further developments in treatment. It is time for the management of carcinoma of the head of the pancreas to be centralized, so that all patients can be included in adjuvant regimens with the hope for more rapid progress. For the first time since 1899, when periampullary carcinoma first was successfully resected,[4] and 55 years from the time the first regional resection was performed,[5] progress is being made in the management of carcinoma of the head of the pancreas.

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $7 million for individual doctors and $13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

Pneumocystis Carinii Pneumonia: Diagnosis And Management

Richard E. Chaisson MD and Mark D. Smith MD, MBA

From the AIDS Service, The Johns Hopkins Hospital, 1830 E. Monument St. - Ste. 7400, Baltimore.

As management of HIV infection becomes more proactive, early identification of persons at risk for PCP and initiation of preventive therapy will become more routine, and the clinical impact of P. carinii may be ameliorated.

Pneumocystis carinii is a unicellular organism that has been categorized historically among the protozoa and more recently among the yeast.[1,2] Prior to the advent of the acquired immunodeficiency syndrome (AIDS) epidemic in the 1980s, *P. carinii* was an unusual cause of human disease, associated with an interstitial pneumonia in individuals with lymphoreticular malignancies or iatrogenic immunosuppression. With the HIV and AIDS epidemic, *P. carinii* pneumonia (PCP) has become an increasingly common entity encountered in clinical practice as well as a diagnostic and therapeutic challenge for clinicians. Numerous clinical and laboratory advances in recent years have resulted in a better understanding of the organism and the diseases it causes, and in the clinical management of patients with PCP.

Epidemiology

P. carinii is widely distributed in nature and causes asymptomatic infection by early adulthood in the majority of most populations studied. Reactivation of *P. carinii* can occur as a result of defects in cellular immunity, particularly helper T-lymphocyte function. Consequently, PCP serves as a biologic and immunologic marker of immunodeficiency in persons infected with HIV, and its occurrence appears to reflect host immune status rather than demographic, behavioral, or other biological factors. Of the 115,000 cases of AIDS reported to the US Centers for Disease Control by November 30, 1989, approximately 60 percent (69,000) had PCP as their initial AIDS-defining illness. Of patients with an initial episode of PCP, up to 60 percent will have a recurrent episode of PCP within 12 months, in the absence of suppressive therapy.[3,4] Moreover, of the 40 percent of AIDS patients with an initial AIDS-defining diagnosis other than PCP, it is estimated that 50 percent ultimately will develop PCP in the absence of chemoprophylaxis. Thus, we estimate that as a result of the AIDS epidemic, there have been more than 100,000 cases of PCP in the United States in the past decade.

In many areas where HIV is prevalent, PCP has become a leading cause of community acquired pneumonia. At Johns Hopkins Hospital, for example, there were approximately 100 admis-

sions for PCP in 1988 as compared to 125 admissions for pneumococcal pneumonia during the same year.[5]

In developing countries where HIV is prevalent, the frequency of PCP is reported to be substantially lower than in North America and Europe. Several factors may explain this apparent discrepancy. First, the likelihood of opportunistic infections in persons with HIV infection is dependent on both the relative immunocompetence of the host and the virulence of the infecting pathogen. In developing countries, where infection with *Mycobacterium tuberculosis* is endemic, clinical disease from reactivation of tuberculosis may occur prior to the development of immunodeficiency sufficient to result in PCP.[6] Moreover, lethal infections caused by pyogenic bacteria may be more prevalent in developing countries and may occur prior to the time when an infected individual would be susceptible to PCP.[7] Hence, tuberculosis and non-pneumocystis pneumonia are the major causes of HIV-associated pulmonary disease morbidity and mortality in developing countries and appear to outrank PCP in frequency. Second, the diagnosis of PCP (discussed below) can be difficult, requiring skilled personnel and sophisticated laboratory equipment. Because these resources are lacking in many developing countries it is likely PCP is underdiagnosed in these settings.

Pathophysiology

P. carinii is an intra-alveolar pathogen that when reactivated causes an interstitial pneumonitis.[8] Replication of *P. carinii* within the alveoli results in a protein-rich exudate, comprised of *P. carinii* trophozoites and cysts. Accumulation of the exudate causes decreases in total lung capacity and vital capacity and a reduction of oxygen transport across the alveolar capillary membrane, reflected in a reduction of the diffusing capacity for carbon monoxide (DLCO). As the pneumonitis progresses, invasion of the alveolar membrane may occur, resulting in interstitial inflammation, edema, and fibrosis.[8] As infection worsens, disruption of the alveolar capillary membranes results in a physiologic state similar to the adult respiratory distress syndrome.[9,10]

Clinical Presentation

PCP in patients with HIV infection is associated primarily with the insidious onset of constitutional and respiratory symptoms culminating in a frank pneumonia. Compared to patients with PCP associated with other causes of immunodeficiency, HIV patients with PCP have a longer prodrome of symptoms (28 vs 5 days) and less severe symptoms.[11] Presenting symptoms include fever, night sweats, nonproductive cough, and progressive dyspnea. Patients presenting with PCP have frequently experienced significant weight loss, often have oral candidiasis, but otherwise may have no notable abnormalities on physical examination. Auscultation of the chest is usually normal. Because of the nonspecific nature of the presenting signs and symptoms, careful evaluation and the establishment of a specific diagnosis are essential.

Differential Diagnosis and Evaluation

The differential diagnosis of pulmonary disease in persons with HIV infection is given in Table 1. While PCP is the most common cause of pneumonia in patients with AIDS and advanced HIV infection, other potential causes of pneumonitis must be given serious consideration. Tuberculosis may have atypical features in persons with HIV infection and should be vigorously sought in the evaluation.[6,12] Persons with a high probability of prior *M. tuberculosis* infection (for example, immigrants from endemic areas, IV drug users, racial/ethnic minorities) are at highest risk of AIDS-associated tuberculosis.[13] Tuberculin skin testing, while very important, may fail to diagnose tuberculous infection because of HIV-related anergy. Community acquired, pyogenic pneumonia may occur at any time during HIV infection and results from defects in humoral immunity.[14] Compared with PCP, bacterial pneumonia tends to have a more abrupt onset, be associated with a productive cough and chest pain, and produce localized abnormalities on examination of the chest.[15] Nonspecific interstitial pneumonitis is characterized by interstitial inflammation in the absence of a demonstrable pathogen.[16]

After a history and physical examination have been performed, patients suspected of having HIV-related pulmonary disease should be evaluated with a chest radiograph. Radiographic patterns commonly seen in patients with HIV infection are listed in Table 2 along with their most common causes. Patients with a radiograph that suggests PCP should undergo sputum induction to establish a diagnosis. Patients with the radiographic appearance of a bacterial or mycobacterial pneumonia can be evaluated with appropriate stains and cultures of expectorated sputum. If the chest radiograph is normal, further evaluation with noninvasive tests is appropriate in order to determine the likelihood of a pulmonary opportunistic infection. The algorithm in Figure 1 is used at our institution for the efficient and sensitive evaluation of patients with suspected AIDS-related pulmonary disease.

Pulmonary function testing is a sensitive method for detecting pulmonary opportunistic infections in

Table 1. Differential Diagnosis of Pulmonary Diseases in Persons with HIV Infection

1. *Pneumocystis carinii*

5. Cytomegalovirus
6. Kaposi's sarcoma
7. Nonspecific interstitial pneumonitis
8. Lymphocytic interstitial pneumonitis

patients with HIV infection. In particular, abnormalities of gas exchange can distinguish patients with and without opportunistic pneumonia. The diffusing capacity for carbon monoxide (DLCO) can detect impairment in gas transport in the lung.[17] When the DLCO is less than 80 percent of that predicted for age, when corrected for hemoglobin, PCP or another infection is likely. Likewise, pulmonary uptake of ^{67}Gallium-citrate 24 to 72 hours after injection is indicative of opportunistic infection. If the DLCO is greater than 80 percent predicted and Gallium lung scanning is negative, then the likelihood of pulmonary infection is less than 1 percent. Because neither DLCO nor Gallium scanning can distinguish between specific infections, an abnormality on either of these tests should prompt a more definitive diagnostic procedure.

Samples of induced sputum from patients with HIV-related lung disease can be used to definitively diagnose PCP and other pulmonary infections.[17] The use of a standardized protocol for the induction of sputum and preparation of specimens is essential for obtaining accurate, reliable results.[18] A number of stains will identify *P. carinii* in sputum. Diff-Quik, a modified Giemsa stain, is an inexpensive and sensitive test for identifying *Pneumocystis* cysts and trophozoites (Figure 2). Considerable experience is important in evaluating slides as the organism may be elusive. Other useful histologic stains include Gomori-silver-methenamine, toluidine blue-O and Gram-Weigert. Recently, immunofluorescence stains using monoclonal antibodies against *P. carinii* have been developed, increasing the ease and sensitivity of sputum induction.[19,20] An indirect immunofluorescence assay (IFA) for *P. carinii* was found in one study to increase the yield of induced sputum from 79 percent with Diff-Quik to 91 percent with IFA.[19] A simpler, single-step direct fluorescence assay has recently been developed. The sensitivity of this assay is equivalent to Diff-Quik but it requires less time and effort.[20] The use of a histologic and immunofluorescence stain together is preferred in our laboratory and many others.

In addition to special studies for *Pneumocystis*, induced sputum may be examined for acid-fast bacilli and fungi and cultured for mycobacteria, fungi, and viruses. Induced purulent sputum should be Gram-stained and cultured for bacteria; *P. carinii* stains should not be performed on these specimens as polymorphonuclear leucocytes and exudate interfere with stains for *P. carinii*.

If a specific diagnosis is not established on induced sputum, a more definitive diagnostic procedure should be performed.[17] Fiberoptic bronchoscopy with bronchoalveolar lavage (BAL) is the preferred method for diagnosing AIDS-related pulmonary disease. The same stains and cultures used for induced sputum can be used for BAL fluid. Sputum induction alone should never be used to rule out PCP or other infections. In one study, 46 percent of patients with a negative induced sputum had PCP diagnosed at bronchoscopy.[21] Thus, while induced sputum may attain a yield of 80 to 90 percent, the negative predictive value of induced sputum is only about 50 percent. If no diagnosis is made by BAL, then a repeat bronchos-

copy and transbronchial biopsy may be performed. The yield of BAL and biopsy together approaches 100 percent. Rarely, patients deteriorating with an undiagnosed pulmonary process may benefit from open lung biopsy.

Therapy

The availability of a murine model of PCP has played a major role in developing treatment regimens for PCP.[8] More recently, a culture system for *P. carinii* and isolation of *P. carinii* dihydrofolate reductase have augmented the search for additional therapies.

Several advances in the drug therapy of acute PCP have been made in recent years. Table 3 lists the drugs used to treat PCP. Trimethoprim-sulfamethoxazole (TMP-SMX) is the gold standard of treatment.[22] The drugs may be administered intravenously or orally at doses of 15 mg/kg day of trimethoprim. Early trials and clinical experience using higher doses (20 mg/kg/day trimethoprim) showed a very high rate of adverse reactions.[23] Use of the lower dose with dose adjustment for toxicity results in more successful completion of therapy.[24] Adverse reactions include anemia, granulocytopenia, hepatitis, rash, and fever. Pentamidine isoethionate has been shown equally effective as TMP-SMX in clinical trials. Toxicity of pentamidine, which includes neutropenia, hepatitis, azotemia, and hypoglycemia, may be reduced by using a lower-dose, 3mg/kg per day.[25] The efficacy of the lower-dose regime, however, is not known. A standard course of anti-*Pneumocystis* therapy is two to three weeks.

The combination of dapsone and trimethoprim has been shown in clinical trials to be as safe as TMP-SMX and significantly less toxic in treating patients with mild PCP ($PaO_2 > 60$ torr).[26,27] Moreover, this regimen is attractive because it can be given on an ambulatory basis. While patients generally have fewer adverse effects, cutaneous reactions, anemia, and methemoglobinemia do occur. Dapsone should not be given to patients with G-6-PD deficiency.

A number of investigational therapies for PCP are available for selected patients. Aerosolized pentamidine (600 mg/day given via a Respigard II nebulizer) was shown in an open trial to be highly effective and extremely well-tolerated in patients with mild to moderate acute PCP ($PaO_2 > 50$ torr).[28] A large-scale, randomized clinical trial comparing aerosol pentamidine with TMP-SMX has been completed recently, but the findings have not been released.

The combination of primaquine (15-30 mg base/day) and clindamycin has shown promise as salvage therapy for patients who failed or were intolerant to other therapies for PCP.[29] Larger, controlled clinical trials of this regimen are under way.

Other investigational agents also have been evaluated in uncontrolled trials. Trimetrexate, a methotrexate analogue with considerable activity against *P. carinii* dihydrofolate reductase, was found to be moderately effective in an open trial as salvage therapy or initial therapy for PCP.[30] Eflornithine (DFMO) has been given with some efficacy to a number of patients with AIDS-related PCP who failed other therapies. However, lack of a standardized protocol makes assessment of the data difficult.

Table 3. Treatment Regimens for PCP

Agent(s)	Dose and Route
Accepted	
Trimethoprim-sulfamethoxazole	15 mg/kg/day-75/kg/day IV or p.o.
Pentamidine isoethionate	4 mg/kg/day IV
Dapsone-trimethoprim	4-100 mg/day p.o. 15-20 mg/kg/day
Experimental	
Pentamidine isoethionate	600 mg/day nebulized
Trimetrexate	30-45 mg/M^2/day
Primaquine-clindamycin	15-30 mg/day-300-600 mg q 6-8h p.o. and IV or p.o.
Eflornithine (DFMO)	

Adjunctive Therapy

In addition to antimicrobial therapy, other supportive measures are useful in managing patients with acute PCP. Supplemental oxygen is frequently needed; a variety of delivery systems can maintain the PaO_2 above 60 torr. Patients with severe PCP may benefit from continuous positive airway pressure. When respiratory failure occurs, mechanical ventilation with use of relatively large tidal volumes (12-15 cc/kg) and positive end-expiratory pressure is indicated. Because severe PCP can cause noncardiogenic pulmonary edema, careful fluid management and judicious use of diuretics are beneficial.

There is considerable controversy regarding the use of corticosteriods in patients with severe PCP. Several unpublished clinical trials reportedly have conflicting results from administration of corticosteriods to patients with PCP. While there may be some benefits to early use of high-dose corticosteriods to prevent development of respiratory failure in patients with PCP, their use after the onset of respiratory insufficiency does not appear effective. Routine use of corticosteriods in all patients with PCP is not warranted at this time.

Prevention of PCP

Because PCP can be predicted to some extent in patients with advanced HIV infection, chemoprophylaxis to prevent PCP is a rational strategy. HIV seropositive persons with low CD-4+ lymphocyte counts ($<200mm^3$) and patients who have had an episode of PCP or another AIDS-associated opportunistic infection are at high risk of PCP. Prevention of PCP and other opportunistic infections in patients with HIV disease was reviewed in the February issue of *MMJ*.[31] In brief, both TMP-

SMX (5 mg TMP/kg/day) and aerosolized pentamidine (600 mg via the Respiragard II nebulizer every 4 weeks) have proved efficacious in reducing the incidence of PCP in patients with HIV.[4,22,31-34]

There is increasing evidence that the use of PCP prophylaxis and antiretroviral chemotherapy have improved survival of patients following an initial episode of PCP.[35] For example, prior to 1985, the median survival of patients diagnosed with PCP was 10 months in one study.[36] In 1987, the median survival increased to 18 months,[37] presumably as a result of the introduction of zidovudine and more widespread use of antimicrobial agents to prevent PCP recurrences. As the management of HIV infection becomes more proactive, early identification of persons at risk for PCP and initiation of preventive therapy will become more routine, and the clinical impact of *P. carinii* may be ameliorated.

Management of Sickle Cell Anemia in Children

George J. Dover MD

Dr. Dover is Professor of Pediatrics, The Johns Hopkins University Medical School.

Approximately 1 in 500 black American births results in children who have sickle cell (SS) disease; they are rarely symptomatic until 6 months of age. The mortality rate of SS in children under age 12 is between 10 and 15 percent. Half this mortality occurs before age 2, and most is due to overwhelming infections.

Sickle cell (SS) disease is a genetic disorder involving adult hemoglobin, a tetramer of two alpha and two beta globin molecules. In SS disease both beta globin molecules contain a valine at the sixth amino acid position rather than a glutamine. The precise amino acid substitution has been known for over 30 years.[1] This abnormal hemoglobin, designated sickle hemoglobin (Hb S, $\alpha_2 \beta^S{}_2$), under conditions of low pH, low oxygen tensions, or dehydration tends to polymerize within the red cell, leading to marked distortion of the shape of the red cell and increased rigidity of that cell. Red cells containing only Hb S have a shortened survival time, leading to a chronic hemolytic anemia. Furthermore, since these abnormal red cells cannot easily traverse small precapillary arterioles, individuals with SS disease often have acute and chronic vaso-occlusive episodes resulting in pain and ongoing vital organ destruction.

Sickle cell disease is extremely common in the black population. Approximately 1 in 10 (around 8 percent) of black Americans are carriers for one abnormal sickle gene (Hb AS, $\alpha_2, \beta^A{}_2, \alpha_2 \beta^S{}_2$). Carriers for sickle cell disease, termed sickle trait, are not anemic and essentially are asymptomatic. Approximately 1 in 500 births in the American black population results in children who are homozygous for the beta-S globin mutation, sickle cell anemia. Other racial groups, including Mediterranean populations (Italians and Greeks), Eastern Asian populations, and Indian populations have lower frequencies of SS disease.

The complications of SS disease in children are quite different from those seen in adults. Because of very high fetal hemoglobin (Hb F) levels at birth, children with sickle cell disease are rarely symptomatic until after six months of age. They do, however, begin to develop anemia around 12 weeks old. The earliest vaso-occlusive events seen in SS disease are sudden painful swelling of the hands and the feet (hand-foot syndrome). Colic-like symptomatology has often been described in children with SS disease under 1 year old. When the child is older the vaso-occlusive crises take on more characteristic forms of acute pain and fever

both in the extremities and the abdomen and may mimic acute osteomyelitis or an acute abdomen.

Children with SS disease also are predisposed to pulmonary complications. Sudden onset of chest pain, respiratory distress, and infiltrates on a chest x-ray, however, can be due to either acute infection or infarctions of the lungs. For this reason, this complication often is referred to as chest syndrome. Another complication of sickle cell disease in childhood is the presentation of strokes. Between 5 and 10 percent of children with SS disease may present with headaches, seizures, or sudden hemiplegia indicating vaso-occlusive phenomena involving the large vessels of the brain.

Beginning at 3 months old SS children also develop functional asplenia. At this time the spleen may be enlarged but is unable to filter and remove bacteria from the blood. This functional asplenia leads to a marked increased in susceptibility to infections, particularly to highly encapsulated organisms such as *S. pneumoniae* and *Hemophilus influenzae*. The mortality rate for SS children under age 12 is between 10 and 15 percent. Half this mortality occurs before age 2, and most mortality is due to overwhelming infections.

Proved Therapies

Table 1 lists the proven effective forms of therapy for SS children. It is paradoxical that a disease for which we have known the genetic mutation for over 30 years does not have more definitive therapies. Although the abnormalities of both the red cell and the hemoglobin within the red cell have been well established, preventive measures for the more severe problems such as vaso-occlusive crises and chronic organ damage are not available.

Prenatal Diagnosis

Landmark contributions to the prenatal diagnosis of sickle cell disease have been made by Dr. Haig Kazazian at Johns Hopkins University.[2] Because the precise mutation in the DNA nucleotide sequence is known, it is quite easy using modern molecular biology techniques to determine whether a fetus carries the gene for sickle cell disease in the heterozygous state (sickle trait) or in the homozygous state (SS disease). The use of chorionic villus biopsy, polymerase chain reaction amplification of the beta-globin region, and nonradioactive labeling techniques allows a prenatal diagnostic laboratory accurately to determine the genotype of fetus. Although the technology for prenatal diagnosis of SS disease has been available for over 10 years, it is not as widely used as is testing for other genetic disorders. This undoubtedly relates to the perceived variability in the severity of SS disease by physicians and families, the lack of education of the at-risk populations regarding prenatal diagnosis, and incomplete identification of carrier status of potential parents.

Table 1. Proved Therapies for Sickle Cell Desease

Prenatal diagnosis
Neonatal screening, genetic counseling and education
Comprehensive well-child care
Penicillin prophylaxis
Vaccines against H. influenzae and S. Pneumoniae

Newborn Screening

Techniques available to screen newborn blood for the presence of Hb S have been present for over 15 years. However, routine neonatal screening for sickle cell disease and other hemoglobinopathies did not gain wide acceptance until approximately 5 years ago. In the early 1980s it became apparent that neonatal diagnosis of children with SS disease significantly decreased morbidity and mortality.[3] Recently, the recognition that prophylactic antibiotic therapy offers significant protection to infants with SS disease[4] has led to the conclusion that all children at risk should be screened routinely in the newborn period.[5] The Maryland State Health Department under the direction of Dr. Susan Panny, Chief of the Division of Heredity Disorders of the Maryland Department of Health and Mental Hygiene, began pilot studies (in July 1985) to screen all newborns in Maryland. Since then over 200 children with sickle cell disease have been identified (Table 2).

The present mechanism for newborn screening includes isoelectric focusing of samples of blood obtained in the nursery as a part of the routine genetic screening performed in all children. Results of hemoglobin screening are known within one week of arrival in the State Health Department. The physician of record at the hospital of birth and the family are notified of abnormal results by the state hemoglobinopathy program nurse coordinator.

Initial newborn screening tests have approximately a 10 to 15 percent rate of false-positives. In some children the presence of normal adult hemoglobin (Hb A), is below the level that can be detected by isoelectric focusing. Therefore, some children who produce both Hb A and Hb S (sickle trait) are incorrectly suspected of having SS disease. For this reason, a second screening test is requested on all suspected SS infants after one month of age. By one month, sufficient Hb A is present in sickle trait children to allow the isoelectric

Table 2. Newborn Screening in Maryland

Year	Total Screened	SS Disease*
1986	63,777	42
1987	66,215	56
1988	68,449	45
1989 (to July)	35,017	16

*Includes diagnoses of SS, SC, and S-Beta Thalassemia

focusing technique to distinguish SS disease from sickle trait.

With confirmation on the second test that the child has sickle cell anemia, the family and physicians are notified that the child should be referred to one of six pediatric hematology consultation services in Maryland or the District of Columbia (Johns Hopkins University Medical School, Department of Pediatrics; University of Maryland Medical School, Department of Pediatrics; Sinai Hospital, Department of Pediatrics; Howard University Sickle Cell Center; Georgetown University Hospital; and the Children's Hospital National Medical Center). The role of these centers is to confirm the diagnosis of SS disease, to educate the parents about the early problems of SS disease including the importance of antibiotic prophylaxis, and to provide genetic counseling for the families of affected SS children.

Early identification of children with SS disease is only part of the newborn screening program in Maryland. Another important part of the program is the education of the parents of SS newborns at the referring hematology centers and the genetic counseling of these families. This is an ongoing process delivered by the hematology centers and state-funded community directed groups such as the Association for Sickle Cell Services, Education, Research, and Treatment (ASSERT). An integral part of the ongoing care of children identified in the newborn screening programs are the state public health nurses who help coordinate referral to appropriate primary care physicians and arrange follow up to appropriate sickle cell referral centers

Comprehensive Well-Child Care

Prior to the era of antibiotic prophylaxis or pneumococcal vaccines, it was documented that the mortality and morbidity of SS disease in children could be reduced significantly by early diagnosis and referral of SS children to comprehensive well-child care programs in which routine immunizations and health assessments are available.[3] In Maryland, if a child is diagnosed as having significant hemoglobinopathy such as SS disease, they automatically qualify for Children's Medical Services (CMS). CMS will cover payment for all routine pediatric care, vaccinations, and health assessments for children with sickle cell disease as well as subspecialty care for acute problems and periodic evaluations by pediatric hematology centers.

Penicillin Prophylaxis

Infection is the most common cause of death in children with SS disease. The risk of pneumococcal sepsis is 400 times that of normal children. In 1985 the results of a nationwide controlled clinical trial of penicillin prophylaxis in children with SS disease were completed.[4] This study confirmed that twice-daily oral penicillin markedly reduces if not eliminates the attack rate for pneumococcal infections in children with sickle cell disease (Table 3). In infancy, penicillin is given in liquid form, and prescriptions must be refilled on a 10-day to 2-week basis. When the children become older they can be switched to tablets (which do not necessitate such frequent prescription refills). It is unknown at what age penicillin prophylaxis should be discontinued.

It is generally accepted that the increase attack rate of pneumococcal infections seems to be highest in the children under 4 years old. Whether children on penicillin prophylaxis will continue to be susceptible for longer periods of time is under investigation. At present, most centers recommend continuation of penicillin prophylaxis until after the second booster vaccination for pneumococcal vaccines, usually performed at the age of 4 to 6 years.

It must be emphasized that the physician cannot assume that children with SS disease are on penicillin. Compliance with this regimen is likely to be as low as that seen in other well-documented programs involving prophylactic antibiotics, for example, rheumatic heart disease. Several studies indicate that noncompliance with prophylactic antibiotics may be anywhere from 50 to 75 percent of cases. It therefore is not surprising that cases of pneumococcal infections continue to occur in Maryland and throughout the country. In most of these cases penicillin prophylaxis had not been given to the children prior to the onset of infection.

It also should be emphasized that prophylaxis with antibiotics other than penicillin is *not* indicated. Although it is clear that penicillin prophylaxis will not protect against *H. influenzae* infections, the safety or efficacy of prophylactic broad-spectrum antibiotics in SS disease is unknown and should not be attempted. It is hoped the increased vulnerability to *H. influenzae* infections will be corrected with the newer forms of vaccinations.

Pneumococcal and Hemophilus Influenza Vaccinations

In 1977 Ammann reported the effectiveness of a polyvalent pneumococcal vaccine in older children with SS disease.[6] The present pneumococcal vaccines include antigens to 23 different serotypes of *S. pneumoniae*. Unfortunately, young children with sickle cell disease do not respond as well to the vaccine as do older ones. The present recommendation is that all SS children at the age of two should be given pneumococcal vaccine. It is clear that the response

Table 3. Penicillin Prophylaxis in SS Disease

Age	Dose
<3 yrs.	125 mg B.I.D. orally
3-5 yrs.	250 mg B.I.D. orally

rate to the vaccine is suboptimal. Penicillin prophylaxis should be continued after the pneumococcal vaccine. A booster dose of the vaccine between four and six years of age leads to a more uniform response and is not associated with any significant side effects. As with penicillin prophylaxis, there are clear cases of pneumococcal infections documented in Maryland and nationwide following vaccination with the present vaccines. Therefore, the physician taking care of a child with SS disease cannot be certain that an immunized child is protected from all pneumococcal infections.

It is now recommended that all SS children be given the *H. influenzae* vaccine at 18 months old. There is no prospective data available determining whether SS children have a decreased attack rate to *H. influenzae* following this vaccine. Early results seem to indicate that a *H. influenzae* vaccine may soon be available for children at around six months of age. These early vaccines will improve the protection of SS infants who are more susceptible to *H. influenzae* infections.

Transfusions

There are relatively few indications for transfusion in children with SS disease. Routine vaso-occlusive crises and periodic infections are not indications for transfusion. Children with SS disease will rarely develop bone marrow aplasia (aplastic crisis). Most recently it has been shown that parvovirus, the etiologic agent of Fifths disease, can cause aplastic crisis in SS children. Other viruses (including the EB virus and hepatitis virus) also have been implicated in the cause of aplastic crises in SS children. SS children with aplastic crises will present with profound anemia and absent or low reticulocyte counts. Transfusion in these children is indicated, particularly when the anemia is associated with fever or with heart failure. In addition, children who present with chest syndrome with significant hypoxia (arterial pO_2 less than 75) may require either simple transfusions or exchange transfusions. SS children who present with clear evidence of strokes require immediate exchange transfusions to quickly reduce their percent Hb S.

Chronic transfusion programs rarely are indicated in SS children because of significant risk of iron overload, alloimmunization, and transfusion-related virus infections. At present, stroke is the only indication for chronic transfusions of SS children. The natural history of strokes in SS children is that they will repeat usually within a year following the initial stroke. Often the second stroke will be more severe, leaving the SS child with a greater neurologic deficit.

Periodic transfusions for SS children are indicated when surgery requiring general anesthesia is anticipated. Under strictly controlled ventilation during operative procedures SS children do not have problems. However, during the immediate postoperative period, when a child may be in pain or heavily sedated, SS children are a great risk of becoming hypoxic. At present SS children followed at The Johns Hopkins University Medical School are given a series of transfusions to reduce their percent sickle hemoglobin to less than 40 percent prior to any elective surgery. Should emergency surgery be necessary, exchange transfusions are performed to reduce sickle hemoglobin levels to less than 40 percent.

Experimental Therapies: Adult Trials

No effective forms of therapy are available that will prevent either acute vaso-occlusive crises or ongoing continuous organ damage in individuals with SS disease. Investigators at The Johns Hopkins University Medical School (Dr. Samuel Charache and Dr. George Dover) have been involved in the development of drugs that might prevent such complications. It should be emphasized that all clinical trials with these experimental drugs are performed in adults; they will not be available to children until their safety and efficacy have been demonstrated in the adult trials. The therapeutic principal behind the research trials at Johns Hopkins is the observation that some drugs increase fetal hemoglobin (Hb F) production in SS individuals. The presence of Hb F in the red cell decreases the tendency of Hb S to polymerize. Levels of Hb F of between 20 to 25 percent within the red cell clearly prevent sickling. Although Hb F levels in SS individuals are higher than in a normal population (Hb F averages around 6 percent in SS patients as compared to less than 1 percent in normal adults), these levels are not sufficient to protect SS individuals from the sickling process. However, rare individuals who have greater than 20 percent Hb F seem to have extremely mild (if not absent) disease. Furthermore, some investigators have shown that individuals with greater than 15 percent Hb F may be less symptomatic than those with lower levels of Hb F.

Drs. Charache and Dover were the first to treat an SS adult with an anticancer drug previously shown in low dosage to increase Hb F in animals.[7] When 5-azacytidine was given to individuals at Johns Hopkins with SS disease, elevations in Hb F were increased to above 20 percent. Patients treated for over two years seem to show a decrease in vaso-occlusive crises. However, no control clinical trials were done with this drug, and improvement may have been due to a placebo effect. In 1982 it became apparent that another drug, hydroxyurea, could also increase Hb F production (see Figure). Since then laboratories under the direction of Dr. Dover at Johns Hopkins have coordinated and followed over 75 SS patients on a variety of protocols with hydroxyurea. At present, a multicenter clinical trial is being coordinated by Drs. Charache and Dover to determine the safest therapeutic dose of hydroxyurea that can be given to patients with SS disease. This trial will be completed in 1990, and if the results

seem encouraging, a definitive control clinical trial of hydroxyurea will be performed. The intent is to raise the Hb F levels high enough with hydroxyurea to reduce sickling to the extent that vaso-occlusive crisis and ongoing organ damage will be reduced in these patients. If the controlled clinical trial is approved, it will take at least three to five years to be completed.

Summary

The etiology and much of the pathophysiology of SS disease has been clearly elucidated over the last 25 to 30 years. Unfortunately, this knowledge has not led to proved effective therapies that prevent vaso-occlusive crises and ongoing organ damage. Our failure to develop effective therapies for SS disease some 30 years after we elucidated this disorder's precise etiology should serve as a warning that therapy for genetic disorders does not always rapidly follow understanding of etiology.

Much improvement has been made in our ability to diagnose SS disease prenatally or in newborns. We have further learned that comprehensive well-child health programs that include prophylactic penicillin and effective vaccinations reduce the morbidity and mortality of SS disease in children. Acceptance of these effective forms of therapy evolved in the 1980s. We hope new therapies, possibly with agents that increase Hb F production, will become available in the 1990s.

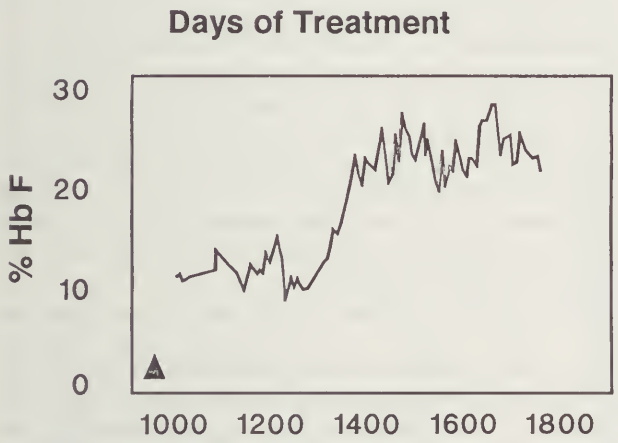

Figure. Changes in Percent Hb F of SS Adult Patient Treated with Hydroxyurea. From day 800 to 1,260 the patient was on oral Hydroxyurea 3 or 4 days a week. From day 1,260 to 1,800 the Hydroxyurea was given daily (7 days a week). The triangle indicates pretherapy Hb F level.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Med-Chi members reading papers before organizations are invited to submit their papers to the MMJ *for consideration for publication.*

The *Maryland Medical Journal* is the monthly publication of the Medical and Chirurgical Faculty of Maryland. Its goals are educational and informative: the publishing of scientific articles and other technical information as well as editorials, special articles (evaluations, position papers, reviews of nonscientific subjects), membership news, notices of medical events, legislative and governmental news, meetings, continuing education courses, and programs and policies of the Faculty.

Manuscripts may be sent to Editor *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by the editor, editorial board members, and guest reviewers. The final decision is reserved for the Editor.

Specifications

When submitting manuscripts for review by *MMJ*'s Editorial Board, please send an IBM compatible floppy disk with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request, *MMJ* will return your disk after your article is published or if your manuscript is not accepted. Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with margins of a least one inch. Number pages consecutively. Please submit two additional copies.

Include in the manuscript the concise title, full name of the author (or authors) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

An introductory synopsis/abstract of approximately 100-150 words is required.

Race, creed, color, national origin, or religion shall not be included in descriptions of case reports unless such information is a necessary contribution to clinical understanding.

Tables are to be typed on separate sheets of paper, numbered, and have a brief descriptive title. The Editor reserves the right to edit tables. Be sure that statistics are consistent in both tables and text.

References are limited to those citations noted in the text. References are to be typed double-spaced and numbered consecutively as they appear in text. They will be examined critically at the time of review and must be kept to a minimum. The number of references is generally limited to 20 in major contributions and fewer in shorter articles. Exceptions may be made if appropriate in the opinion of the reviewing editor. Personal communications and unpublished data should not be included. The following are necessary: names of all authors, complete title of article cited (lower case), name of journal abbreviated according to *Index Medicus*, volume number, first and last page numbers, and year of publication. For more extensive information about preparing medical articles for publication, the editors suggest the International Committee of Medical Journal Editors: Uniform requirements for manuscripts submitted to biomedical journals. The complete document is available in the June 1982 issue of the *Annals of Internal Medicine*.

Illustrations are material that cannot be set in type. *Photographic material* must be submitted as high-contrast, glossy prints. *Drawings and graphs* must be done professionally in india ink on high-grade white drawing paper or be computer generated. **Omit illustrations that do not increase understanding of text, and limit them to a reasonable number.** Four or fewer illustrations should be adequate for a manuscript of 4 to 5 typed pages. Identification should be typed on a gummed label and affixed to the back of each illustration: figure number, title of manuscript, name of senior author, and arrow indicating top. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs and drawings. **Cost of printing color photographs must be borne by the author.**

Recognizable photos of patients are to be masked and should carry with them written permission for publication.

Permissions. When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright. Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

Editorial Responsibility

Manuscripts are subject to editorial modification and such revisions necessary to bring them into conformity with *MMJ* style.

Galley proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Statements made or opinions expressed by any contributor in any article or feature published in *MMJ* are the sole responsibility of the author. ■

Thrombolytic Therapy For Myocardial Infarction

Alan D. Guerci MD

Dr. Guerci is Associate Professor of Medicine, The Johns Hopkins Medical Institutions, Baltimore.

Thrombolytic therapy has provided a practical means of reducing infarct size and infarct-related mortality. Clinicians must weigh the aparent risks and benefits of thrombolytic therapy: if the ischemic region is large, if treatment can be applied early enough to salvage ischemic mycardium, and if there is no obvious risk of life-threatening hemorrhage, it is likely the patient will benefit from thrombolytic therapy.

In the decade since DeWood and colleagues demonstrated that thrombotic occlusion of epicardial coronary arteries is the proximate pathophysiologic event in the overwhelming majority of acute myocardial infarctions, more than 40,000 patients have been enrolled in randomized trials of thrombolytic therapy, which have established conclusively that the administration of thrombolytic agents in the first four to six hours of myocardial infarction reduces mortality.[1-5] This reduction in mortality is concentrated among patients with anterior infarction and those treated very early. The latter observations raise a series of important questions. Will thrombolytic therapy preserve left ventricular function or reduce mortality among patients with inferior infarction, the elderly, patients with non-ST segment elevation infarcts, or patients presenting late (more than six hours after the onset of symptoms)? What is appropriate adjunctive medical therapy to prevent reinfarction and death after thrombolysis? Is it possible, on the basis of available data, to identify a thrombolytic drug of choice?

Inferior Infarction

GISSI and ISIS-2 reported a mortality rate of 8 percent for patients with inferior infarction not receiving thrombolytic therapy and 7 percent for those treated with streptokinase.[1,2] Although this difference was not statistically significant ($p = 0.09$), large numbers of patients with inferior infarction probably benefited from thrombolytic therapy in these two trials. In GISSI, patients were eligible for entry as much as 12 hours after the onset of symptoms, but benefit was confined to patients treated within 6 hours. In ISIS-2, benefit was greatest when treatment was initiated within 3 hours of the onset of infarction, and benefit decreased steadily thereafter. The investigators in these trials have reported mortality according to infarct location and time to treatment but not both. Thus, it seems highly likely that the benefit of streptokinase in patients with inferior infarction was diluted by the inclusion of large numbers of patients more than 6 hours after symptom onset. It is just as likely that treatment of patients with inferior infarction within 3 or 4 hours will reduce mortality risk.

A second line of evidence supporting the conclusion that thrombolytic therapy may reduce the morbidity and mortality in inferior myocardial infarction is derived from the relationship between the size of an ischemic region and the benefit of thrombolytic therapy. Experimental and clinical studies have shown repeatedly that the size of an ischemic region, its inverse, ejection fraction, or clinical variables related to ejection fraction (such as heart rate and blood pressure) more accurately predict the risk of death than does a simple classification of patients according to infarct location (Table 1).[6] Thus, for the typical patient with inferior infarction, who comes to medical attention two to four hours after the onset of symptoms, size of the ischemic region is the overwhelming determinant of benefit from thrombolytic therapy. A suggested list of patients with inferior infarction likely to benefit from thrombolytic therapy appears in Table 2. For the most part, these considerations apply to patients who can be treated within the four- to six-hour period within which human myocardial ischemia is thought to be reversible.

Hemodynamic compromise unresponsive to atropine should be considered as de facto evidence of a large ischemic region and life-threatening ventricular dysfunction. This may take the form of lung congestion if the left ventricle is involved or hypotension in the case of large right ventricular infarcts. Even in the absence of overt hemodynamic compromise, patients with widespread ST segment deviations should be regarded as having larger rather than smaller infarctions. This includes patients with ST segment elevation in leads V5 and V6 (in addition to leads 2, 3, and AVF), or, alternatively, patients with widespread precordial or lateral ST segment depression in addition to inferior ST segment elevation.

In the absence of specific contraindications, patients with previous anterior or lateral myocardial infarction also should be considered for thrombolytic therapy. Even when hemodynamically compensated, most such patients have fair or even poor left ventricular function. It is reasonable to believe that small amounts of myocardial salvage will substantially improve the functional status and life expectancy of such patients.

The last group of patients within the inferior infarction group generally considered eligible for thrombolytic therapy are the very young. Most young Americans with acute myocardial infarction have one or more risk factors, which make it likely they will sustain recurrent infarction in other locations in the years ahead. Even if thrombolytic therapy for inferior infarction does not substantially affect the short-term prognosis for such a patient, preservation of some inferior wall motion may substantially improve the long-term prognosis.

The Elderly

Treatment of elderly patients is an important issue because age, along with infarct size, is one of the two most powerful determinants of the mortality risk of acute myocardial infarction. Although the reduction in all-cause mortality achieved with streptokinase in the GISSI trial in patients over the age of 75 was not quite significant, there was a significant reduction with streptokinase in more than 3,400 patients over the age of 70 in ISIS-2 (Table 3). Highly significant reductions in mortality were reported in patients aged 65 to 75 in the ASSET study of tPA [3] and in patients aged 65 to 70 in the AIMS trial of APSAC.[5] Thus, there is abundant evidence of treatment-associated reduction in mortality in patients up to age 75, and there are, at a minimum, strong trends toward reduced mortality in patients over the age of 75.

There is a widespread misconception in this country that patients over the age of 75 are somehow not eligible for thrombolytic therapy. This misunderstanding seems attributable to the fact that many of the trials, and especially the NIH-sponsored Thrombolysis in Myocardial Infarction (TIMI) studies, have excluded patients over age 75. However, these ex-

Table 1. Relationship of Electrocardiographic Leads with ST Elevation to Mortality in Acute Myocardial Infarction

Number of Leads with ST Elevation	Mortality (%)	
	Streptokinase	Placebo
2 or 3	6.1	6.8
4 or 5	7.7	11.5
6 or 7	12.1	16.6
8 or 9	19.5	23.9

Table 3. All Cause Mortality Among Elderly Patients in the Four Largest Randomized Trials of Thrombolytic Therapy

Study	Age	Mortality (%)		P-Value
		Control	Treatment	
Streptokinase:				
GISSI	>75	33	29	0.12
ISIS-2	>70	22	18	<0.02
tPA:				
ASSET	65-75	16	11	0.001
APSAC:				
AIMS	65-70	30	12	0.005

clusions have more to do with the logistics of randomized clinical trials and the decision by the TIMI study group to focus its attention on the value of highly invasive adjunctive therapy than on the inherent suitability of patients over the age of 75 for thrombolytic therapy.

As stated above, the evidence for benefit consists of a strong trend toward reduced mortality in more than 1,000 patients over the age of 75 in GISSI and a significant reduction in mortality in some 3,400 patients over the age of 70 in ISIS-2. Indeed, it seems probable that pooling of data from these two studies for patients over the age of 75 would yield a significant difference in favor of treatment. There is no evidence of increased mortality among elderly patients treated with thrombolytic agents, provided that the usual screening for patients at risk of serious bleeding occurs. In fact, the allegation of an increased bleeding risk in elderly patients is not fully substantiated. Investigators from Duke University and the TIMI study group have reported some increased risk of bleeding in elderly patients treated with tPA, but much of this excess bleeding occurred in conjunction with emergency or urgent angiography. In connection with a noninvasive approach to thrombolytic therapy, the ISIS-2 investigators reported that "there was no (significant) excess of bleeds among the 401 who are aged 80 or over... no evidence that the risk of treatment, in particular cerebral haemorrhage or other bleeding, were related to age."

A prudent interpretation of these data would include acknowledgment of the possibility of some increased risk of hemorrhage in elderly patients treated with thrombolytic therapy. However, there is no evidence that this risk of bleeding is prohibitive. The problem, then, seems to be one of refinement of patient-selection criteria. Patients should be in good general health, the infarct should be larger rather than smaller, and treatment should begin sooner rather than later.

Non-ST Segment Elevation Infarction

GISSI and ISIS-2 reported no reduction in mortality when patients with ischemic myocardial pain and ST segment depression were treated with streptokinase. In that most patients with ST segment depression infarction do not have total thrombotic occlusion of infarct artery, this result is perhaps not surprising. On the other hand, patients with total occlusion of the circumflex coronary artery or its major branches not infrequently present with ischemic myocardial pain, precordial ST segment depressions, and no ST segment elevations. It is therefore somewhat perplexing that there was not even a trend toward reduced mortality with treatment in this subgroup. Be that as it may, the available data do not support the widespread application of thrombolytic therapy to patients with ST segment depression infarcts. Exceptions to this rule would include patients with known high-grade circumflex disease, in whom ST segment depression in the precordial leads could reasonably be attributed to true posterior transmural ischemia, and patients with widespread ST segment depression and hemodynamic compromise. The latter group comprises patients with left main disease, its equivalent, or high-grade proximal LAD disease. The usual treatment for these patients is insertion of an aortic counterpulsation balloon and emergency cardiac catheterization, with definitive therapy based on the results of the coronary arteriogram. In community hospitals that do not offer aortic balloon counterpulsation, the very high mortality rate associated with this particular presentation would seem to justify administration of thrombolytic therapy as a temporizing measure until the patient can be transferred to a tertiary center.

Late Treatment

ISIS-2 reported a significant reduction in mortality when patients were treated with streptokinase 6 to 24 hours after the onset of infarction, but the GISSI investigators observed no reduction in mortality when streptokinase was given 6 to 12 hours after the onset of infarction. Table 4 lists the combined results of the GISSI and ISIS-2 6- to 12-hour treatment groups as well as the results of treatment at 12 to 24 hours from the ISIS-2 study. Together, these studies indicate fairly strong but ultimately nonsignificant trends toward reduced mortality with streptokinase. Whether this statistical nonsignificance is due to inadequate sample size, insufficient quantities of viable myocardium at these late points in time, or other factors is unknown.

Two statements can be made with regard to late treatment. First, ongoing chest pain is probably a symptom of active ischemia, and clinicians should pay as much heed as to the patient's description of severity of pain as to when the pain began. For the rare patient who presents with ongoing, severe ischemic myocardial pain, ST segment elevations, and well-preserved R-waves, thrombolytic therapy is probably beneficial even when started late.

A second group likely to benefit includes patients with large infarcts, usually anterior infarcts, treated at 6 to 12 hours. Two lines of evidence support this approach. First, animal studies have shown consistently that late reperfusion (reperfusion too late to salvage ischemic myocardium) reduces infarct expansion. Infarct expansion is a pathologist's term for thinning and dilatation of an infarcted segment. Basically, it means aneurysm formation, which is thought to be reduced by late reperfusion because the restoration of blood flow permits accelerated scar formation. Since

Table 4. Relationship Between Time to Treatment and Mortality in GISSI and ISIS-2

Time to Treatment	Mortality (%)		P-Value
	Control	Streptokinase	
6-12 hours	12.9	11.5	0.12
12-24 hours	10.8	8.7	0.08

aneurysm formation in humans is strongly associated with congestive heart failure and sudden cardiac death, late reperfusion may substantially improve the functional status and life expectancy of such patients.

A second justification for late treatment comes from the Western Washington trial of intracoronary streptokinase. In this study, patients were eligible for entry as much as 12 hours after symptom onset. Mean time to treatment was 4.6 hours and mean time to recanalization was almost 6 hours. As in the case of other studies of reperfusion at 5 to 6 hours, there was no improvement in left ventricular function. However, patients whose infarct arteries were reperfused by streptokinase had an in-hospital mortality rate of 4 percent, whereas patients with persistent total occlusion of the infarct artery had an in-hospital mortality rate of 11 percent.[7]

Physicians considering late treatment of patients should bear the following in mind. First, the benefit of late treatment is not "proved" in the usual statistical sense. Although a strong argument can be made for application of thrombolytic therapy 6 to 12 hours into the course of myocardial infarction, patients certainly should not be subjected to excessive risk. Thus, patients should have none of the known or suspected risk factors for serious bleeding. These include recent head trauma or surgery, recent TIA, or stroke, active peptic ulcer disease, recent major surgery, and probably a history of severe and uncontrolled hypertension. Second, it should be remembered that aneurysm formation is a fairly common complication of anterior infarcts but a rare complication of inferior infarcts. Thus, treatment probably should be confined to patients with evidence of intermediate to large anterior infarctions and large inferior infarctions.

Adjunctive Therapy

In conjunction with streptokinase, aspirin and heparin have both been shown to reduce the risks of mortality and nonfatal reinfarction.[2,8] Whether there is added benefit when aspirin and heparin are given together is unknown. This question should be answered in the near future by the ongoing GISSI-2 trial.

Heparin has been shown to prevent reocclusion after treatment with tPA.[9] As in the case of streptokinase, whether aspirin offers additional benefit is unknown. The risk of intracranial hemorrhage appears to be around 0.5 percent when tPA and heparin are given together and aspirin is added on the second hospital day. The risk of intracranial hemorrhage increases to 1 percent when heparin, aspirin, and tPA are given simultaneously. Whether this increase in intracranial hemorrhage is offset by a reduction in overall mortality is unknown.

The risks and benefits of heparin and aspirin in patients treated with APSAC remain unknown.

Drug of Choice

It is not known whether the apparent coronary thrombolytic superiority of tPA will lead to further reductions in mortality when compared to streptokinase. What is known about this highly controversial subject is that the coronary patency rates 90 to 120 minutes after treatment with tPA are higher than those 90 to 120 minutes after treatment with streptokinase. Representative figures would be 80 and 60 percent, respectively.[10-15] As arbitrary as choice of a 90 to 120 minute observation time for thrombolytic effectiveness might seem to be, it is highly predictive of subsequent clinical outcome. Patency 90 to 120 minutes after initiation of therapy has been consistently associated with improved left ventricular function and/or reduced hospital mortality. The implication of these observations alone would seem to support selection of tPA in patients with acute myocardial infarction. However, angiography performed 24 to 48 hours after treatment show similar patency rates (around 85 percent) for both agents. Thus, the superiority of tPAs may have more to do with the speed of reperfusion than with ultimate patency rates. What is not known is how much clinical benefit will be derived by reperfusion 2 to 24 hours after treatment. Moreover, optimal regimens for each of these drugs have not been established.

The most impressive results of treatment with streptokinase have been reported from Auckland, New Zealand.[16,17] In a placebo-controlled trial of streptokinase that reported dramatic benefit, and in a comparative study of streptokinase and tPA that found no difference in subsequent left ventricular function, the New Zealand investigators gave 1.5 million units of streptokinase over 30 minutes. This contrasts with the 60-minute infusion recommended by the Food and Drug Administration (because it was found to be effective in the GISSI trial). In both New Zealand trials, patients underwent coronary arteriography and left ventriculography three weeks after hospital admission. Thus, the patency rate associated with this accelerated infusion of streptokinase is unknown.

Similarly, several groups of investigators have experimented with accelerated infusions of tPA. These include reports of an 80 percent patency rate 60 minutes after a 50 mg intravenous bolus and 87 percent patency rates 90 minutes after a 90-minute infusion of 100 mg of tPA.[18,19] Both these infusions are substantially different from the 3-hour, 100 mg dosing regimen recommended by the FDA. It should be understood that FDA approval of a drug indicates a judgment by the FDA that a particular drug regimen is effective and reasonably safe, not a judgment that the FDA knows the best drug regimen. The FDA's recommendation for tPA dosing, for example, was based on trials from Johns Hopkins and Sydney, Australia in which 100 mg of tPA given over 3 hours was found to be associated with significant preservation of left ventricular function.[20,21]

Conclusion

The 1980s were an exciting time for cardiologists, as thrombolytic therapy, for the first time, provided a practical means of reducing infarct size and infarct-related mortality. As with other treatments, clinicians must weigh the apparent risks and benefits of thrombolytic therapy. If the ischemic region is large, if treatment can be applied early enough to salvage ischemic myocardium, and if there is no obvious risk of life-threatening hemorrhage, it is likely that the patient will benefit from thrombolytic therapy.

PHYSICIANS
Come Grow With Us...

We are looking for physicians in:
- **Orthopedics**
- **Pediatrics**
- **Family Practice**
- **Emergency Medicine**

Nestled in the Eastern Panhandle of West Virginia, Jefferson Memorial Hospital is a non-profit community hospital serving the health care needs for over 75 years. Located in the fastest growing county of the State – it is just minutes from Virginia and Maryland – 60 miles from D.C. amidst the Blue Ridge Mountains and Shenandoah River: truly the best of both worlds at your doorstep.

Hoping to increase our medical staff to keep pace with our growth, it's no wonder Jefferson County is "on the map."

JEFFERSON MEMORIAL HOSPITAL
P.O. Box 1228 — *1 Hour from DC*
Charles Town,WV 25414 — *15 minutes from VA*
(304) 725-3411 Ext. 210 — *15 minutes from MD*

Please direct all inquiries to:
Mr. James Bryan, Administrator

Free office space, relocation expenses, malpractice assistance and guaranteed salary await your arrival to one of the best kept secrets in the State.

Catastrophic Illness is Rare and the Treatment is Critical.

You know the patient. The one with chronic psychosis that hasn't responded to general inpatient care. The patient has comprehensive coverage so you've been able to admit him time and time again for inpatient care. But there's been little if any improvement, and you're frustrated. It's time to refer him to a hospital that is committed to treating the long term refractory patient and has the resources to do it. Sheppard Pratt.

Today's literature discourages long term hospitalization, and we agree. That same literature does, however acknowledge that a small group of chronic patients cannot be treated any other way. In 1984, Sheppard Pratt opened an 18 bed unit that treats only those types of patients.

We are not talking about custodial care nor do we treat patients who spend years talking about delusions. We provide long term, active, behavioral, psychopharmacological treatment for those patients who can genuinely be helped.

In addition to managing systematic and aggressive medication trials, our patients live within an established token economy. Patient education and social skills programming, and specialized activity therapy are provided daily throughout treatment. Formalized psychoeducation is also a vital component of treatment and family involvement. Comprehensive discharge planning is given attention equal to inpatient care. Sheppard Pratt provides many options for aftercare including a quarterway house, supervised housing, vocational training, outpatient therapy and medications management, and day hospitals.

Sheppard Pratt is a comprehensive network of psychiatric services. In addition to our 322 bed hospital we maintain the 16 bed Mt. Airy House, numerous community outreach programs and the National Center for Human Development. For more than 100 years, Sheppard Pratt has earned its reputation for providing quality care to the chronically ill patient. And during these difficult economic times, we remain loyal to that heritage.

For further information or to make a referral contact the Adult Admissions Office at:
(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

Disorders of Carbohydrate Absorption in Clinical Practice

Ramon G. Montes MD and Jay A. Perman MD

From the Division of Pediatric Gastroenterology/Nutrition, The Johns Hopkins Hospital, Baltimore. *A portion of the work described in this article was supported by the Dome Corporation.*

The most important of the genetically determined causes of carbohydrate malabsorption, lactase deficiency, affects the majority of the world's adults. Management of carbohydrate malabsorption consists of temporary or permanent removal of the offending sugar from the patient's diet or providing the sugar in a more digestible form.

Malabsorption of dietary sugars may cause symptoms of diarrhea, flatulence, bloating, and abdominal pain. Intolerance to sugars results from primary heritable deficiencies of enzymes and transport processes required for their assimilation or secondary to intestinal mucosal injury.

Physiology of Carbohydrate Digestion and Absorption

The average Western diet contains 40 to 60 percent of calories as carbohydrate, of which approximately half is starch. The disaccharides lactose and sucrose are additional important components of dietary sugar content, and lactose is generally the principal carbohydrate ingested in early infancy. Additional sugars in the diet include fructose, found in fruits and soft drinks, and nondigestible sugars including cellulose, stachyose, and raffinose.[1]

All ingested carbohydrates must be hydrolyzed to the monosaccharides glucose, galactose, and fructose prior to absorption and transport across the enterocyte (Figure 1). The luminal action of salivary and pancreatic amylase (as well as breast milk amylase in infants) splits starches, which are polymers of glucose, into shorter chains that then can be further cleaved to free glucose by glycosidase enzymes at the brush border surface of the enterocyte.[2] Several distinct glycosidases are located in the microvillus membrane of the small intestinal absorptive cell, the most clinically relevant being the glucoamylase-maltase complex and the disaccharidases, sucrase-isomaltase or sucrase-alpha-dextrinase and lactase. These enzymes are glycosylated protein complexes anchored to the brush border, with the catalytic sites protruding toward the lumen.

The glucoamylase-maltase complex is responsible for the final hydrolysis of small glucose polymers derived from starches into free glucose and for 20 percent of the maltose digestion; it is an important alternate pathway for starch digestion when pancreatic amylase is absent or reduced. The major portion of the maltose and all branched glucose polymers or alpha-dextrins resulting

from the initial hydrolysis of starches are further hydrolyzed by the action of the dimer sucrase-alpha-dextrinase. The sucrase moiety of this dimer enzyme hydrolyzes sucrose to glucose and fructose. Lactase hydrolyzes lactose into its component monosaccharides, glucose and galactose.[1]

Monosaccharides released by the activity of brush border enzymes are then absorbed and transported across the enterocyte. Glucose and galactose share an energy-dependent transport mechanism linked to sodium, which increases the affinity of the carrier for glucose. Fructose is absorbed by an independent transport mechanism, and its absorption appears to occur by facilitated diffusion.[3]

The capacity for hydrolysis of glucose polymers and sucrose exceeds the capacity for absorption of the component monosaccharides. That is to say, brush border amylase and sucrase activities are present in excess relative to the rate of absorption of their constituent hexoses. In contrast, lactase activity is the rate-limiting step in digestion of lactose,[1] and release of glucose and galactose proceeds at a rate insufficient to give maximal rates of active transport. Accordingly, injury to the small intestinal mucosa typically will result in lactose malabsorption while assimilation of other sugars may remain intact. Greater reserve of sucrase-alpha-dextrinase and glucoamylase activities permits continued hydrolysis of their substrates except in conditions of severe mucosal damage.

Consequences of Malabsorption

Carbohydrate malabsorption may lead to intolerance, defined as some combination of watery diarrhea, bloating, crampy pain, and flatulence occurring after the ingestion of a particular sugar that escapes small bowel absorption. Mechanisms associated with carbohydrate malabsorption are illustrated in Figure 2. Unabsorbed carbohydrates in the small bowel and colon exert significant osmotic pressure, resulting in secretion of fluid and electrolytes into the lumen, and in some cases a watery fecal output.[2] A portion of the sugar entering the colon is fermented by colonic bacteria with production of lactic and other short-chain organic acids. These acids may exacerbate symptoms, since they are osmotically active and stimulate colonic motility. However, the colonic mucosa is capable of absorbing significant amounts of the volatile fatty acids produced by fermentation, thereby reducing the osmotic load and thus the potential fluid loss in the stool. The extent to which these fatty acids are metabolized following their absorption also represents a salvage pathway for calories that otherwise would be lost. The remaining organic acids excreted in the feces account for the acidic stools associated with carbohydrate malabsorption. Fermentation also results in production of the gases hydrogen (H_2), methane, and carbon dioxide, which may lead to abdominal distention and flatulence. These gases readily diffuse into the portal circulation and eventually are exhaled.[4] The presence of H_2 in expired air as an index of carbohydrate malabsorption is discussed below.

A number of variables in addition to the digestive and absorptive capacity of an individual for a given sugar substrate determine whether malabsorption produces symptoms in a given patient. These variables are listed in Table 1 and form the basis by which many individuals with lactose malabsorption attributable to "adult onset" lactase deficiency tolerate nutritionally

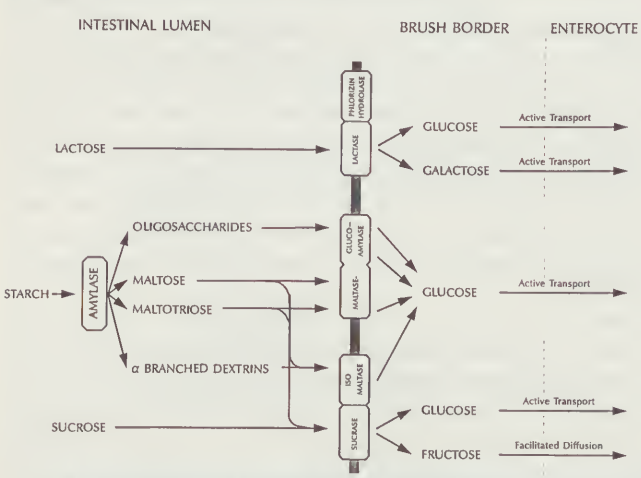

Figure 1. Carbohydrate digestion and absorption

Table 1. Factors Influencing Degree of Carbohydrate Intolerance

- Intestinal digestive and absorptive capacity
- Amount of carbohydrate ingested
- Rate of delivery of carbohydrate to small intestine
  - Alterations in gastric emptying
  - Enteral tube feedings - bolus vs. continuous drip
- Response of small intestine to osmotic load
- Metabolic activity of the colonic flora
  - Regulation of colonic wastage and diarrhea
- Absorptive capacity of the colon
  - Water
  - Short-chain organic acids
- Patient subjectivity and psychodynamics

significant amounts of milk without developing marked symptoms.[4]

Disorders of Carbohydrate Malabsorption

Alterations of carbohydrate digestion and absorption may be determined genetically or result secondarily to a variety of conditions. Examples are indicated in Table 2. Ontogenetic forms of sugar malabsorption in infancy are attributable to immaturity of digestive functions. For example, transient lactose malabsorption occurs in premature infants until lactase activity matures, and a degree of starch maldigestion occurs in the first six months of life[3] because of decreased secretion of pancreatic amylase.

Primary lactase nonpersistence, also known as primary lactase deficiency or primary adult-type hypolactasia, is the most important of the genetically determined causes of carbohydrate malabsorption. This deficiency results from a postweaning decline in intestinal lactase activity. The decline begins at varying ages depending on the ethnic group but usually after age five. Lactase deficiency has been associated with both diarrhea and recurrent abdominal pain in childhood.[5,6]

The majority of the world's adult population is lactase deficient, as indicated in Table 3.[2,7] The two adult human lactase phenotypes (either high or low activity) are attributable to different alleles of a regulatory gene at one autosomal locus. The effect of the allele causing persistence of lactase activity is dominant to the allele causing decline of lactase activity; therefore, primary lactase nonpersistence is the recessive phenotype.[1,7]

Congenital forms of disaccharidase and transport deficiencies are much rarer but include glucose-galactose malabsorption and sucrase-isomaltase deficiency. These conditions present with diarrhea following ingestion of the offending sugar. Thus, glucose-galactose malabsorption presents at birth in an infant fed breast milk or a standard lactose-containing formula, and fructose is the only carbohydrate that can be tolerated. Sucrase-isomaltase deficiency may present later in infancy upon the introduction of sucrose-containing formula or fruits. This condition is more common among Greenland and Canadian Eskimos and Canadian Indians, and incidences as high as 10 percent are reported.[1]

Malabsorption of sugar is very common in a number of intestinal diseases that cause intestinal mucosal damage or atrophy, as indicated in Table 2. Injury to the brush border by infectious agents, notably rotavirus and *Giardia lamblia*, commonly cause transient intolerance to lactose.[3] Contamination of the small bowel by bacteria, associated with diabetes and other disorders affecting intestinal motility and in immunodeficiency syndromes, often leads to disaccharidase deficiencies and to impaired monosaccharide transport. Bacterial proteases and glycosidases degrade brush border enzymes, and products of bacterial metabolism including deconjugated bile acids interfere with glucose transport.[1,8] The infant with short bowel also malabsorbs carbohydrate because of insufficient surface area to which carbohydrates may be exposed for enzymatic digestion and transport. Mucosal damage induced by other dietary components, as in immune-mediated cow milk-and soy protein-sensitive enteropathy and in celiac disease, also will frequently lead to sugar malabsorption.[3] Pancreatic insufficiency occurring in cystic fibrosis results in maldigestion of starch due to reduced or absent pancreatic amylase, but its magnitude and clinical significance are under investigation.[9,10] Carbohydrate malabsorption also has been reported in the acquired immunodeficiency syndrome.[5] Our preliminary data indicate that lactase deficiency is common in infants with AIDS.

Table 2. Examples of Conditions Associated with Carbohydrate Malabsorption

Primary
Congenital lactase deficiency
Glucose-galactose malabsorption
Sucrase-isomaltase deficiency
Primary lactase nonpersistence ("adult onset")
Ontogenetic
Lactase deficiency of the premature infant
Deficiency of pancreatic amylase in infancy
Secondary
Cow milk- and soy protein-sensitive enteropathy
Gluten-sensitive enteropathy
Contaminated small bowel syndrome
Giardia lamblia infestation
Rotavirus infection
Short gut syndrome

Table 3. Prevalence of Lactose Malabsorption in Selected Ethnic Groups

Nationality	Percent	Nationality	Percent
Americans		Danes	3
Caucasians	19	British	6
Blacks	65	Germans	15
Indians	95	Spaniards	15
Eskimos	83	Soviets (Leningrad)	15
Mexican-Americans	52	Israelis	66
Mexicans	83	Arabs	80
Canadians		Central Africa (Bantu)	95
Caucasians	6	Indians (overseas)	75
Indians	63	Vietnamese (USA)	100
Swedes	1	Thais	98

Diagnosis of Carbohydrate Malabsorption

Recent data indicate that patients and physicians often have difficulty accurately relating gastrointestinal symptoms to specific dietary sugar intake.[11] The diagnosis of carbohydrate malabsorption should accordingly be established objectively by simple diagnostic tests. Futhermore, restriction of specific carbohydrates in the diet often represents a considerable task on the part of the patient and therefore should be undertaken when justified by testing. Accurate diagnosis in infants is particularly necessary for proper selection of the formula among the wide variety of

choices now available for treatment of carbohydrate and other nutrient malabsorption.

Diagnosis of specific carbohydrate malabsorption previously relied on measurement of disaccharidase activity in mucosal biopsies obtained from proximal small intestine. Aside from being invasive, this technique does not reflect total mucosal hydrolytic capacity but may be useful in the diagnosis of congenital deficiencies.[2] Widely applied traditional oral tolerance tests are dependent on the extent of blood glucose increase following administration of a specific sugar. These provide no information as to whether the sugar has been incompletely absorbed and require frequent blood sampling. Moreover, the results can be affected by alterations in gastric emptying, intestinal motility, and intermediary glucose metabolism.[2] Both false-positive and negative results have been reported in adults and up to 30 percent of children tested.[1,12]

Measurement of parameters directly related to the fate of carbohydrates reaching the colon provides a better indication of incomplete absorption. These are listed in Table 4. Tests for reducing sugars in the stool and fecal pH are useful office or bedside screening methods but require the presence of the suspected carbohydrate in the patient's diet.

Table 4. Methods for Detecting Carbohydrate Malabsorption

Test	Technique	Result
Sugar in feces	1. Place small amount of liquid stool in test tube 2. Dilute with twice its volume of water 3. Place 15 drops of the resulting suspension in a second test tube together with a Clinitest® tablet 4. Compare the resulting color with the chart provided for testing of urine Note: Sucrose is not a reducing sugar. Test for sucrose malabsorption requires 1N HCl instead of water, followed by brief boiling.	Negative $\leq$ 0.25% Equivocal 0.25%-0.5% Positive $\geq$ 0.5%
Fecal pH	1. Dip Nitrazine® paper into liquid part of stool 2. Compare resulting color of paper with chart provided	Positive $\leq$ 5.5
Breath hydrogen	1. Patient is fasted (overnight if possible) 2. Obtain fasting sample of expired air 3. Administer oral load of test sugar, usually 2 g/kg; maximum 50 g as 20% solution. Doses and concentration should be reduced when severe intolerance is suspected	Negative < 10 ppm above baseline Equivocal 10-20 ppm Positive > 20 ppm

Breath Hydrogen Test

The breath hydrogen test, which is based on production of H_2 by colonic bacteria during fermentation of malabsorbed sugar, is the most reliable means of identifying carbohydrate malabsorption. This test is used extensively in adult and pediatric gastroenterologic practice at The Johns Hopkins Medical Institutions. Recent innovations have permitted its use in the practitioner's office and in the home.

Hydrogen in expired air occurs as a result of absorption of a portion of the H_2 produced in the intestinal lumen when sugar is malabsorbed. Breath H_2 analysis offers several advantages for the detection of carbohydrate malabsorption in adults and children. Breath is sampled noninvasively, permitting frequent repetition of measurements. No separation steps are required prior to analysis of the sample, thus allowing rapid measurement. In addition, breath samples can be stored in simple collection systems and analyzed at central facilities at a later time.

The test generally is performed after an overnight fast, by obtaining samples of expired air before and at thirty minute intervals for three hours following administration of aqueous sugar solutions. A longer testing period is needed if the test substrate is administered in a complex meal such as yogurt. Substrate selection, form, and dosage are flexible. The conventional dose of lactose for investigation of lactose malabsorption is 2 g/kg (maximum 50 g) given as a 20 percent solution (10 percent in infants under 6 months or if severe intolerance is suspected). Testing also can be done using formula, milk, or yogurt as the source of the test carbohydrate. The breath can be collected by a simple nasal prong into which the patient breathes normally and does not require active cooperation by the subject (Figure 3). The examiner aspirates small volumes of air into a plastic syringe with each expiration, until a sufficient volume for analysis is collected.

Samples stored in the plastic collection syringes are stable for at least eight hours, longer if sealed or refrigerated. Alternatively, the samples can be easily transferred to special nonsterile vacutainers in which stability has been documented for periods exceeding thirty days.

The ease of sampling and feasibility of sample storage has led to our recent development of a breath collection kit that can be packaged and mailed, permitting home or office testing of lactose and other sugar intolerance. The kit includes test carbohydrate, the nasal prong, collection syringes, special vacutainers for storage, and mailing materials, along with simple instructions for their use (Figure 4). The stored breath samples are then sent to the central laboratory for analysis. Carbon dioxide concentration in the sample is used as an internal standard for quality control and to normalize H_2 values in individual samples.[13] In this way breath H_2 testing can now be widely available as a practical diagnostic tool.

Analysis of H_2 in breath samples is accomplished by

gas chromatography. Instruments for this purpose are commercially available and may be practical for centers performing frequent tests.

A positive test is indicated by a rise in H_2 concentration of 20 or more parts per million (ppm) above the baseline, defined as the lowest value obtained at any sampling time. A breath H_2 rise in the first 120 minutes following ingestion of substrate can completely discriminate biopsy-proved isolated lactase-insufficient subjects from lactase-sufficient subjects.[5] High fasting H_2 concentrations or an early H_2 rise in the first 30 minutes after substrate ingestion may indicate small bowel bacterial overgrowth. Fasting H_2 concentration is particularly useful for this purpose if the pretest dinner meal is standardized to red meat and rice as the only source of carbohydrate.[14] False-negative tests attributable to inability of colonic bacterial flora to produce H_2 from unabsorbed carbohydrates occur infrequently,[1] and sometimes may be associated with prior antibiotic usage. Applications of breath H_2 testing are summarized in Table 5.

Management of Carbohydrate Malabsorption

Treatment of sugar malabsorption requires reduction or removal of the offending sugar from the patient's diet. In infancy, lactose and other disaccharide malabsorption is usually secondary and therefore transient, and numerous proprietary formulas permit specific choices to modify the infant's carbohydrate intake (Table 6).[3] Congenital sucrase-isomaltase deficiency is managed with

Table 5. Specific Applications of Breath Hydrogen Tests

Detection of	Substrate
Starch malabsorption	Rice starch
Disaccharidase deficiency	
Lactase	Lactose
Sucrase	Sucrose
Monosaccharide malabsorption	
Glucose	Glucose
Fructose	Fructose
Small bowel bacterial overgrowth	Glucose or lactose
Mouth-to-cecum transit time	Lactulose

MJ3232A®	2.8% tapioca starch
Provimin®	2 g citrate per 100g powder

lactose-containing formulas and avoidance of sucrose-containing foods. Glucose-galactose malabsorption is treated by eliminating all dietary carbohydrate except fructose, and carbohydrate-free formulas to which fructose is added can be used in these patients. Ontogenetic lactose malabsorption in premature infants currently is managed by using glucose polymers as the source of at least 50 percent of the carbohydrate in proprietary formulas designed for these babies.

In older children and adults with primary lactase deficiency, avoidance of foods rich in lactose including fresh or powdered milk and milk pudding is often sufficient, since many patients will tolerate foods with smaller amounts of lactose such as cheese.[1] Total elimination of lactose or dairy products is rarely necessary, and may compromise the patient's nutritional status, particularly in children. Alternatives for patients who want to consume milk or in whom adequate calcium intake cannot be achieved by other means include prehydrolyzed milk treated with microbial-derived lactase enzyme or ingestion of this enzyme with milk products at mealtime. Yogurt containing active live culture from which microbial lactase is released is often well tolerated by lactase-deficient individuals.[4] The calcium in this product is normally absorbed by lactose malabsorbers.[1] Frozen yogurts appear not to confer the beneficial effect of standard yogurt.

Summary

Carbohydrate malabsorption is a common clinical problem seen in a variety of settings. In infancy, it is the nutrient most likely to influence tolerance to a particular formula in a number of conditions that cause secondary sugar malabsorption. Genetically determined "adult onset" lactose malabsorption is very prevalent and may present with nonspecific gastrointestinal complaints. In all cases, a precise diagnosis can be established by appropriate tests. The breath hydrogen test is the most accurate and least invasive of these and is now available for home or office use. Management of carbohydrate malabsorption consists of temporary or permanent removal of the offending sugar from the patient's diet, or as in the case of lactose intolerance, providing the sugar in a more digestible form to help relieve the patient's symptoms.

Preservation of Sexual Function in Men During Radical Pelvic Surgery

Patrick C. Walsh MD, Charles B. Brendler MD, Thomas Chang PhD, Fray F. Marshall MD, Jacek I. Mostwin MD, Ray Stutzman MD, and Peter N. Schlegel MD

From the James Buchanan Brady Urological Institute of The Johns Hopkins Medical Institutions, Baltimore. Reprints: Patrick C. Walsh MD, Brady Urological Institute, Marburg 134, The Johns Hopkins Hospital, Baltimore, MD 21205.

Recent neuroanatomical findings making it possible to intraoperatively identify the branches of the pelvic plexus that innervate the corpora cavernosa have been used to modify standard radical prostatectomy and cystoprostatectomy to prevent postoperative sexual dysfunction.

In the past, sexual dysfunction was a common complication following radical pelvic surgery of all types: radical prostatectomy, radical cystoprostatectomy, and abdominoperineal resection. Despite the common occurrence of this complication, only recently was it clear why impotence occurred or how it could be prevented. In 1982 a study from The Johns Hopkins Medical Institutions demonstrated that impotence following radical prostatectomy occurred secondary to injury to the branches of the pelvic plexus that innervate the corpora cavernosa.[1] As a result, minor modifications in the surgical procedure were proposed, based on sound anatomical and pathological principles,[2,3] in order to avoid this complication. Over the past eight years these modifications have been employed extensively during radical prostatectomy[4-9] and cystoprostatectomy.[10-11] We outline the anatomical considerations necessary for preservation of sexual function, the surgical technique and results with radical prostatectomy and cystoprostatectomy, and the possible application of this knowledge to rectal resection.

Anatomical Considerations

Penile erection is mediated by a coordinated vascular and neurological event that results in increased inflow of blood to the corpora cavernosa, dilation of venous sinosoids within the penis, and decreased venous outflow from the corpora cavernosa. Neurological input is primarily from the parasympathetic component of the autonomic nervous system. Emission and ejaculation are mediated predominantly by sympathetic nerves that travel from the thoracolumbar region of the spinal cord along the sympathetic ganglia and down the hypogastric nerves to the pelvic plexus.

Detailed understanding of the exact location of the pelvic plexus and the important branches providing innervation to the corpora cavernosa has only recently been possible.[1-3,11,12] The pelvic plexus is formed by parasympathetic visceral efferent

preganglionic fibers (the pelvic nerve or nervi erigentes) that arise from the sacral center (S2 to S4) and sympathetic fibers arising from the thoracolumbar region via the hypogastric nerve (Figure). The pelvic plexus is located retroperitoneally on the lateral wall of the rectum 5 to 11 cm from the anal verge with its midpoint related to the tip of the seminal vesicle, forming a fenestrated rectangular plate situated in the sagittal plane. Branches from the pelvic plexus provide innervation to the rectum, bladder, prostate, seminal vesicles, urethra, and corpora cavernosa. The cavernous branches travel in a direct route from the pelvic plexus toward the posterolateral base of the prostate, gradually coalescing from a group of fibers approximately 12 mm wide to a more organized bundle approximately 6 mm wide at the level of the prostate. At this point the cavernous nerves travel in association with the capsular arteries and veins of the prostate in the lateral pelvic fascia outside the prostatic capsule and Denonvilliers' fascia. They ascend from the level of the apex of the prostate posterolaterally to the urethra where they penetrate the urogenital diaphragm. Note that the bulk of the pelvic plexus is located lateral and posterior to the seminal vesicles. Thus, the seminal vesicles can be used as a landmark intraoperatively to identify the pelvic plexus, which is imbedded in thick fascia and perforated by branches of the inferior vesical artery and vein suppling the rectum, bladder, and prostate. The cavernous nerves also can be identified intraoperatively, as they travel posterolaterally to the prostate on the anterolateral surface of the rectum by their rather constant association with the capsular arteries and veins of the prostate. This association of the cavernous nerves with the capsular vessels of the prostate (the neurovascular bundle) provides the macroscopic landmark that aids in the identification of these microscopic nerves.[2,4,12]

Operative Technique for Radical Retropubic Prostatectomy and Cystoprostatectomy

Based upon these findings, it is possible to identify the location of the pelvic plexus and cavernous nerves intraoperatively and to make an informed decision whether it is safe to preserve these anatomical structures or necessary to excise them widely with the specimen. In all surgical procedures for cancer, the major goal is excision of all the tumor; preservation of sexual function is of secondary consideration. Previously, impotence following radical prostatectomy occurred secondary to injury to the branches of the corpora cavernosa at one of three steps during standard radical prostatectomy:

1. Apical dissection with transsection of the urethra

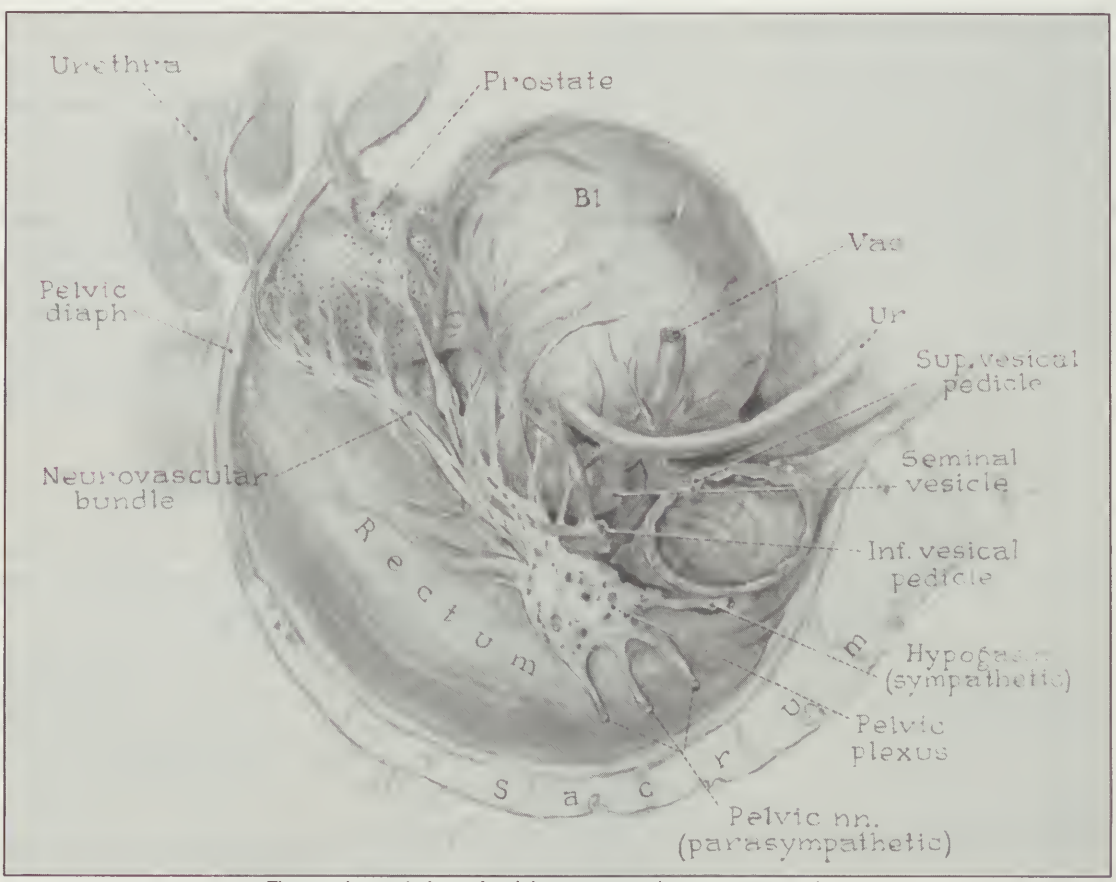

Figure. Lateral view of pelvic organs and neuroanatomy in man as reconstructed based on cadaveric dissections. (Reprinted with permission from J Urol 1987;138:1402-1406)

2. Separation of the prostate from the rectum
3. Division of the lateral pedicle[1,2]

There is no evidence that the neurovascular bundles were completely resected during standard radical prostatectomies.[2,7,8] Instead, they were inadvertently or unknowingly injured during the steps that were performed without precise identification and resection of the neurovascular bundles.

In 1979 the anatomy of the dorsal vein complex and Santorini's plexus was clarified, and modifications in the surgical procedure were proposed to reduce blood loss and improve surgical exposure.[13] These changes made it possible to visualize the neurovascular bundles intraoperatively. Previously many surgeons dreaded this operation because of the profound blood loss encountered when the dorsal vein complex was transected at the apex of the prostate. However, once the exact anatomy of the dorsal vein was understood, it became possible to ligate and accurately control bleeding from this complex. After a bloodless field is achieved, the urethra is transected and the prostate is separated from the rectum in the midline. At this point the neurovascular bundles are identified, a step that had not been performed before. Here the surgeon determines the proximity of the neurovascular bundles to the tumor and decides whether they must be excised or can be safely preserved without compromising the cancer operation. If the decision is made to excise the neurovascular bundle on the side of the tumor, the neurovascular bundle on the contralateral side usually can be preserved. With excision of the neurovascular bundle it is now possible to obtain wider soft tissue margins than were formerly attained with standard radical prostatectomy.[6-9] The specific operative steps in this surgical procedure have been detailed elsewhere.[2,3,14]

In patients undergoing radical cystoprostatectomy, the usual bilateral pelvic lymph node dissection is performed, the ureters divided, the obliterated umbilical and superior vesical arteries transected, and the plane between the bladder and rectum developed by incising the peritoneum at the apex of the rectovesical cul-de-sac. Once this is accomplished, the surgeon may remove the specimen in a retrograde fashion using the steps described above for radical retropubic prostatectomy.[4,10,11] Alternately, the dissection can continue from above with ligation of the posterior pedicles along the lateral surface of the seminal vesicle, thus avoiding injury to the pelvic plexus.[11]

Results Following Radical Prostatectomy

Preservation of Sexual Function We recently published a follow-up evaluation on 320 men, followed postoperatively from 1 to 5 years.[9] Of these 320 men, 259 were potent preoperatively and had sexual partners. Postoperatively, 74 percent (192) are potent. Potency, defined as the ability to achieve an erection sufficient for vaginal penetration and orgasm, returns gradually over the first two years following surgery.[8] Potency was correlated with both the age of the patient and the stage of the disease: it returned in 100 percent of men age 30 to 39; 79 percent of men 40 to 49; 85 percent of men 50 to 59; 64 percent of men 60 to 69; and 14 percent of men 70 to 75. Also, potency returned in 93 percent of patients with stage A1 disease, 72 percent of stage A2, 92 percent of stage B1 N, 72 percent of stage B1, and 56 percent of stage B2 patients.

The tumor was confined within the capsule in virtually all men with stage A1 disease, so it is reasonable to assume that both neurovascular bundles can be preserved completely in most men with this stage of disease. This factor is responsible for the excellent return of sexual function among patients with stage A1 disease. On the other hand, the reduced rate of potency in men with stage B2 disease indicates that attempts at resection of more advanced tumors result in greater injury to the cavernous nerves. In cases where it was necessary to excise one neurovascular bundle, 69 percent of men are potent postoperatively.[6] Thus, one can conclude that potency can be maintained following radical prostatectomy even when it is necessary to excise one neurovascular bundle widely.

Cancer Control For over 80 years radical prostatectomies were performed without knowledge of why impotence occurred or how it could be prevented. Thus, it is not surprising this innovation in surgical technique might raise the question of whether cancer control has been compromised. At the outset it should be clear that this is a total radical prostatectomy, not a lumpectomy. If the operation is performed correctly it should be as effective (if not more effective) in removing tumors than prior attempts using a less anatomic approach that relied on blind, blunt dissection. As outlined earlier, the cavernous nerves are located outside the capsule of the prostate and Denonvilliers' fascia.[1,2,12] This is the first principle on which this procedure was devised. Consequently, if all of the tumor was located intracapsularly, it should be possible to preserve sexual function in every patient without injury to these nerves. However, despite current attempts at staging prostatic cancer, the tumor often penetrates the prostatic capsule and into adjacent soft tissue. During standard radical perineal prostatectomies, in the past, the lateral pelvic fascia was reflected off the prostate in an effort to avoid injury to the dorsal vein of the penis and to Santorini's plexus.[2,7-9] Thus, the excellent long-term control of disease reported following radical perineal prostatectomy has been achieved without routine resection of the lateral pelvic fascia and neurovascular bundles. Also, the descriptions of radical retropubic prostatectomy available in standard textbooks provide no evidence that the neurovascular bundles were completely resected during the retropubic approach. These observations have been confirmed by examining specimens removed by the standard radical perineal and retropubic approaches.[2,7] One of the advantages of the anatomical

approach to radical prostatectomy is the accurate control of blood loss, which provides a clear surgical field. When this technique is used, all structures are visualized clearly and a decision can be made, based on the operative findings, as to whether the structures can be preserved or must be resected with the specimen. In this manner, a wider margin of resection can be achieved than was possible using blunt dissection.[6]

Ever since this new surgical approach was developed, the pathologists at The Johns Hopkins Hospital have carefully examined all step-sectioned radical prostatectomy specimens. Early in our experience, pathologists compared prostatic specimens removed by the standard radical perineal technique, the standard radical retropubic technique, and the nerve-sparing operation to determine the amount of periprostatic tissue and skeletal muscle that was removed.[2] These findings confirmed the anatomical observations mentioned above and suggested that less periprostatic tissue and skeletal muscle was removed with the radical perineal approach than with either of the retropubic approaches, but that none of the techniques appeared to compromise the adequacy of the removal of limited cancer of the prostate.

We subsequently evaluated pathologic specimens from the first 100 consecutive patients who underwent nerve-sparing radical retropubic prostatectomy.[5] Although 41 percent of the patients had established capsular penetration, only seven had positive surgical margins. All of these seven patients had extensive extraprostatic involvement by tumor and five had involvement of the seminal vesicles, poor prognostic findings. In none of these cases were the surgical margins positive only at the site of the nerve-sparing modification. On the basis of these findings, there was no indication that the nerve-sparing modification compromised the adequacy of the removal of cancer, which was determined primarily by the extent of the tumor rather than by the operative technique.

We recently reviewed the pathologic findings in 414 consecutive radical prostatectomies performed for clinical stage A and B carcinoma.[9] Ten percent of the patients had positive surgical margins. The frequency of positive surgical margins was always the same or less than the percentage of patients with positive seminal vesicles and very similar to the percentage of patients with positive lymph nodes. These data appear to confirm our initial impression that patients with positive surgical margins have extensive disease and are in a very high-risk group for the subsequent development of distant metastases. It is likely that no surgical procedure will eliminate all tumor in this small, unfavorable subset of patients. Two recent studies from other institutions confirm these findings.[15,16]

The true efficacy of this procedure will be established only when long-term follow-up evaluations have been performed to determine whether the control of local disease and distant metastases is similar to that achieved with standard radical prostatectomy. Because adjunctive therapy does not influence long-term tumor-free survival, we have avoided the use of adjuvant radiotherapy or hormonal therapy, and we shall be able to evaluate the true impact of radical prostatectomy on the control of prostatic cancer alone.

Because the clinical course of prostatic cancer patients can be protracted and because fifteen-year tumor free survival must be demonstrated before one can categorically conclude that a patient is cured, it will take many years to make a final judgment. However, an earlier more sensitive predictor of cancer control is the rate of local recurrence. Schellhamer[17] has reported a 10 percent rate of local recurrence in the first five years in patients with clinical stage A and B disease and with longer follow-up of fifteen years the total failure rate only increased to 15 percent; 75 percent of the local failures were seen in the first five years with the other 25 percent presenting in the second five years. We recently evaluated the actuarial five-year local failure rate in the 320 patients in this series who have been followed from one to six years. The actuarial[18] overall local recurrence rate (with or without distant metastases) at five years is 10 percent.[19] Of the 10 patients who developed local recurrence, one had a tumor pathologically confined to the prostate, seven had established penetration through the prostatic capsule into soft tissue with or without positive surgical margins, one had microscopic involvement of the seminal vesicles, and one had positive lymph nodes. Four of these ten patients also had distant metastases. In five of the ten cases, the neurovascular bundle was partially or completely excised on the side of the lesion in an attempt to obtain a wider surgical margin. Based on our experience prior to the development of the nerve-sparing technique, approximately 10 percent of patients treated at this institution develop local recurrence as the first sign of failure postoperatively in the first five years. Consequently, the results using this new technique so far are consistent with our past experience and the cases reported in the literature. However, longer follow-up of this group of patients will be necessary to confirm these findings.

Results of Radical Cystoprostatectomy for Bladder Cancer

Over the past five years, 25 men who were potent preoperatively have undergone radical cystoprostatectomy for the treatment of invasive transitional cell carcinoma of the bladder.[11] Pathologic evaluation of all specimens demonstrated negative surgical margins and no patient has developed local recurrence of tumor. Of the patients who had cystectomy alone, 83 percent are potent. Among patients who also underwent urethrectomy, all are able to have erections postoperatively, and 40 percent have erections that are sufficient for intercourse. The potent patients in this group had the urethrectomy performed 4 to 15 months after the cystectomy.

Discussion

There is an aphorism "You only see what you look for, and you only look for what you know." This saying applies to the pelvic plexus and cavernous nerves that in the past were concealed by the dense pelvic fascia and intertwining branches of the inferior vesical vessels. With the identification of macroscopic landmarks it is now possible to identify these structures intraoperatively and to make an informed decision whether these structures need to be sacrificed or whether they can be safely preserved during the dissection. Based on our present experience with men undergoing radical retropubic prostatectomy and radical cystoprostatectomy this knowledge has enabled sexual function to be preserved in a majority of patients and at the same time enabled the surgeon to provide wider margins of excision where necessary. With wider application of these principles to colorectal surgery, similar favorable impact on the quality of life and improved surgical exposure may be possible.

Advances in Diagnosis and Treatment of Glaucoma

Harry A. Quigley MD

From the Glaucoma Service, Wilmer Institute, The Johns Hopkins University School of Medicine, Baltimore. Reprints: Maumenee B-110, Wilmer Institute, Johns Hopkins University School of Medicine, Baltimore, MD 21205.

More changes have occurred in the last 10 years in the diagnosis and treatment of glaucoma than occurred in the previous 100 years. Emphasis in diagnosis and follow-up has shifted from measurement of the intraocular pressure to detection and assessment of damage to the optic nerve, objectively and subjectively.

In the last 10 years new medical therapies for open-angle glaucoma have emerged (particularly topical beta blockers) that have made practical the treatment of earlier stages of disease. Clinical trials challenge the traditional hierarchy of therapeutic sequencing that ranked drops and pills first, laser surgery second, and operative surgery third. In the treatment of angle-closure glaucoma, the major change has been the development of laser surgery to produce iridectomies, replacing operative procedures.

Diagnosis of Open-Angle Glaucoma

Glaucoma traditionally has been thought of as having two features: intraocular pressure above the statistically normal range and a characteristic physical change in the optic disc due to loss of nerve fiber substance and deepening. In parallel with the latter, there is a loss of mid-peripheral vision that ultimately spreads to involved loss of all vision.

In the last 20 years, data from clinical studies have fundamentally changed our understanding of glaucoma. Most importantly, if one follows a large cohort of persons with statistically elevated intraocular pressure but no optic nerve damage, the vast majority of such "ocular hypertensives" survive 5 to 10 years without evidence of visual field loss.[1] To be precise, only 1 percent per year appear to be undergoing damage. It is clear that many eyes tolerate modest elevation of intraocular pressure without injury.

Second, a minority of persons with optic nerve damage of the glaucoma type have intraocular pressures in the statistically normal range. Because of this group, it is now understood that the risk of losing vision from glaucoma is a nonlinear function of eye pressure, and the damage probability increases almost exponentially with increasing intraocular pressure.[2]

These observations have important implications for the identification of glaucoma patients. If one screens the population for glaucoma by performing intraocular pressure measurements alone, a substantial number of true glaucoma patients are passed as normal (since their pressures are normal), while a large number

of ocular hypertensive persons are found, many of whom have no substantial short-term risk of developing optic nerve damage. While they certainly merit follow-up as glaucoma suspects, they represent more than ten times as many persons as those with elevated eye pressure and existing damage in a visual field test (that is, the true glaucomas).

Thus, screening by measurement of eye pressure alone is a poor means to find glaucoma. It misses from one-third to one-half of true glaucoma patients on a single random measurement, and it identifies ten times as many suspects as truly damaged persons. Pressure screening is not worthless: it simply has an unacceptably low sensitivity and specificity.

Observation of the Optic Disc

The most rewarding means to identify persons with glaucoma by screening may be the examination of the optic disc. The appearance of the disc in glaucoma has been known from many years. It combines two features of the disease: loss of optic nerve fibers and physical excavation of the disc. The normal disc has a pink rim of tissue and a central pale area of leftover space called the cup. The cup is the space not needed for fibers to fill the opening in the eyewall for optic nerve fibers to leave the eye. In glaucoma, nerve fibers are lost, leading to thinning of the pink rim and enlargement of the cup. Furthermore, the cup undergoes a deepening and an undermining that is characteristic for a backward compression of the disc tissues in glaucoma (Figure 1). While this appearance is occasionally mimicked by normal optic discs, it represents a fundamentally sound method for identification of the glaucoma patient. It is especially important to recognize substantial asymmetry between the two discs in the same person. This results from the typical unilateral onset of nerve damage in glaucoma, with one eye's cup enlarging in its disc before its fellow does.

The last five years have seen the application of image analysis techniques (developed for military satellite observations) to the quantification of the surface topography of the optic nerve head in glaucoma (Fig-

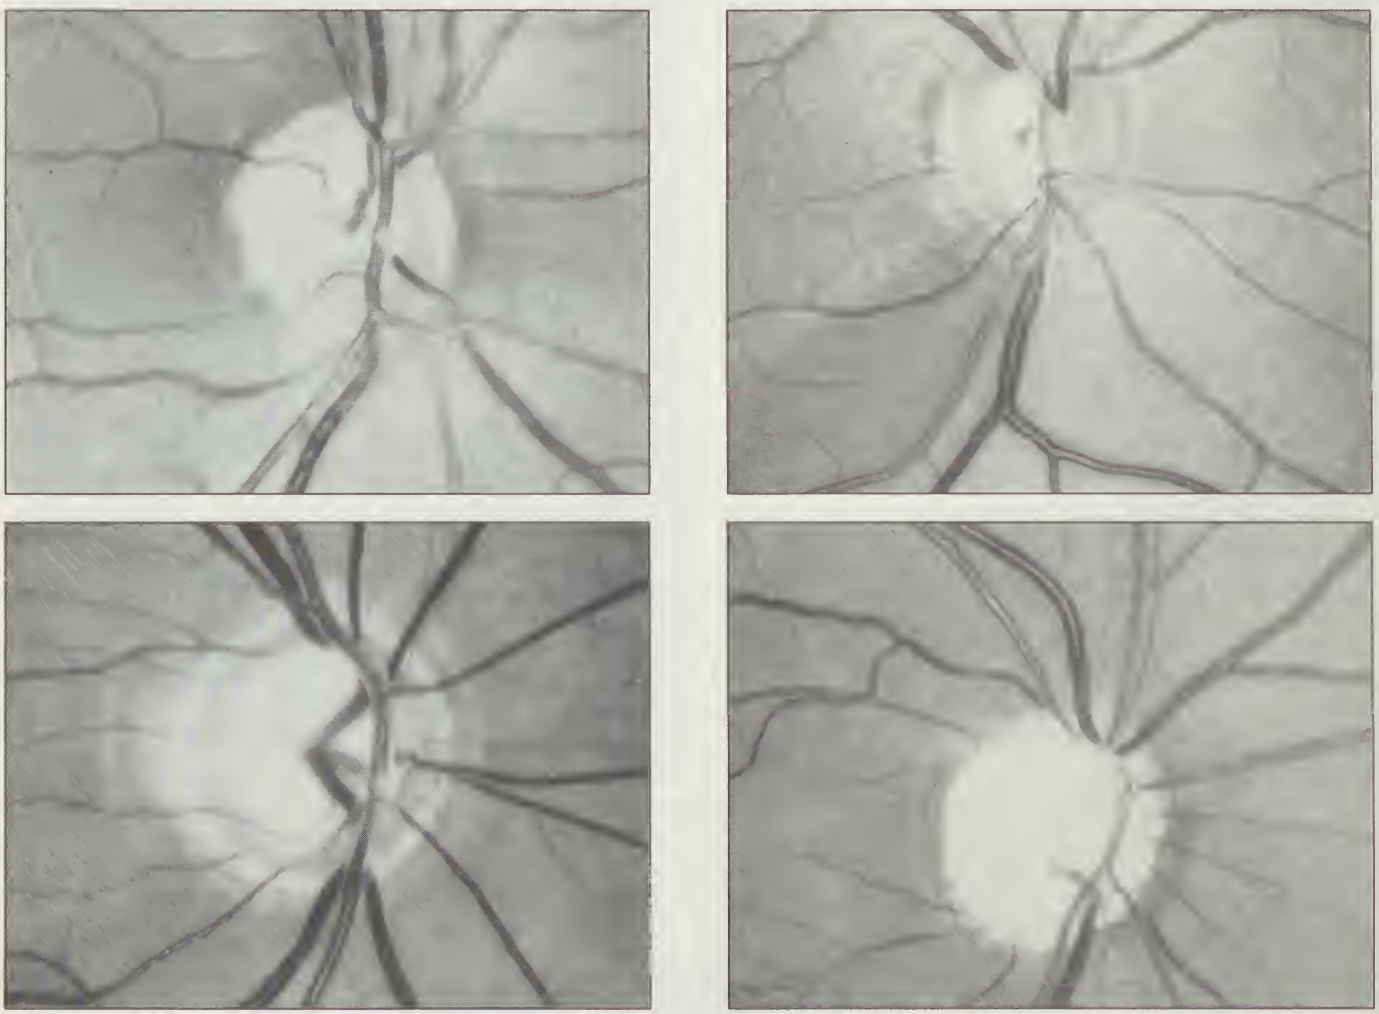

Figure 1. The figure illustrates four optic discs, the first, upper left, is normal. The central disc has a small paler area, the cup, and blood vessels course across the rim of the disc without deviation until they reach this central zone. The upper right disc has lost a notch of tissue from its lower pole, leading to enlargement of the cup in this direction. a further stage of damage, with the central pale cup occupying much of the disc and blood vessels seeming to fall over the edge of the disc rim at the margin of this cup. The lower right photograph shows a totally atrophic glaucoma disc, in which the cup is as large as the disc and blood vessels dive into the disc at its very margin.

ure 2). It is feasible to diagnose and to follow glaucoma damage in human eyes with systems that quantify the disc appearance and measure its changes over time. Whether such systems will be clinically useful and financially practical remains to be seen.

Retinal Nerve Fiber Layer

Better methods than simple optic disc observation are needed to detect glaucoma damage at its earliest stage. A group at Johns Hopkins began to examine the retina near the optic disc in the green light of an ophthalmoscope over 10 years ago. Our aim was to detect and subjectively to analyze the number of optic nerve fibers by clinical examination.

We concluded that nerve fiber layer examination is a simple, inexpensive, and reliable means to detect early glaucoma injury, even prior to the development of reproducible visual field defects[3] (Figure 3). In our prospective study of 1,500 patients over an eight year period, nerve fiber layer examination appears to be more sensitive for detecting damage than is disc examination.

Visual Field Testing

Perhaps the greatest recent change in the diagnosis of glaucoma damage is the introduction of new methods for testing the visual field. To detect loss of side vision, the patient traditionally looked into a dimly illuminated bowl and was asked to respond when a target light appeared. This general approach is now formalized into programs of stimulus presentation that are selected and analyzed by computer microprocessors. The machines are able to test more rapidly and objectively that a purely human tester might, though experienced technicians are still vital during testing. The graphics capability of the instrument adds significantly to the understanding of the findings (Figure 4).

Further improvements have been the addition of comparison normal data and sophisticated statistical differentiation of true abnormality from random variation. Correlation of histological material from glaucoma eyes donated to eye banks with automated visual field studies performed in the same eyes during the patient's life have confirmed the greater sensitivity of new field tests over past systems.[4]

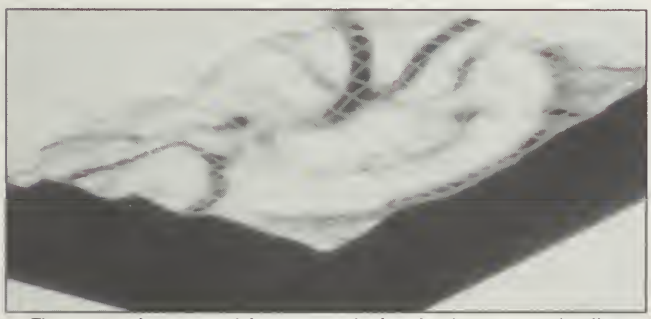

Figure 2. Automated image analysis of a human optic disc allows the conversion of the image into digital data that can be reprocessed and expressed as a pseudo three-dimensional wireplot.

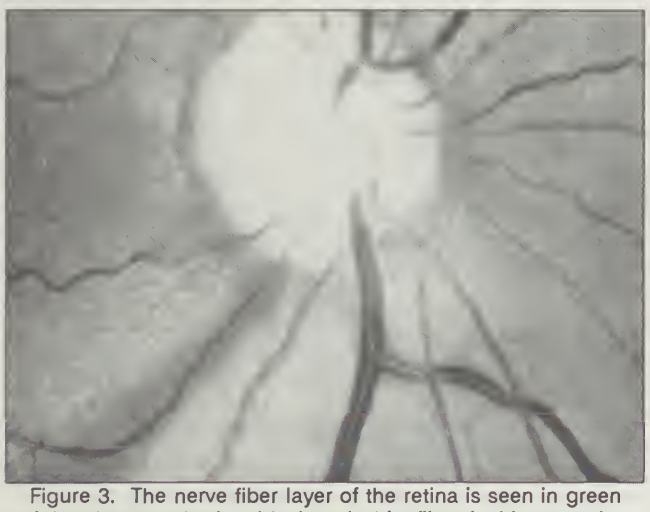

Figure 3. The nerve fiber layer of the retina is seen in green light, photographed on black and white film. In this example, a defective area with loss of the normal striated pattern due to glaucoma damage is shown at the 7 o'clock position of the disc, extending out to the lower left.

Implications for Glaucoma Screening

Previously, measurement of eye pressure by tonometry seemed an appropriate means to identify those with glaucoma seen in a general medical practice. While tonometry is far from useless, it is obvious that the separation of the population at risk for glaucoma damage is poorly performed by pressure screening alone. Studies are under way to evaluate combinations of questionnaires, tonometry, and retinal examination of optic disc and nerve fiber layer, along with rapid, automated visual field screening.

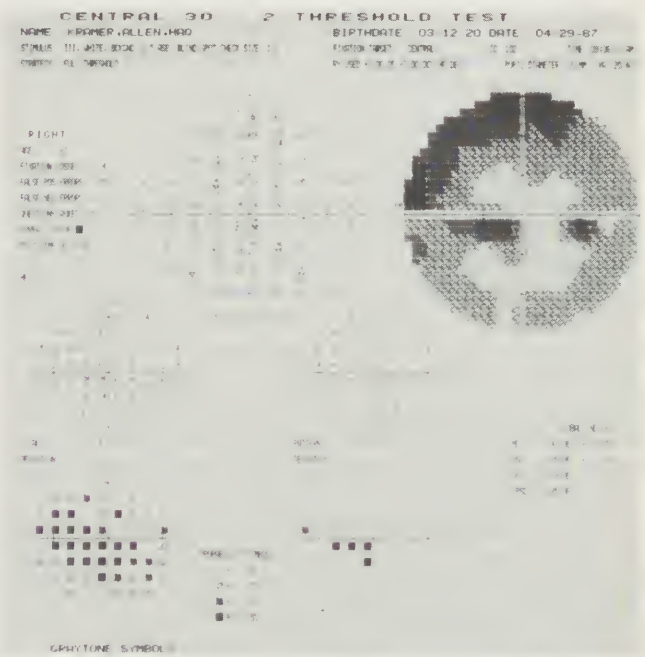

Figure 4. The output from an automated visual field test shows not only the raw data on sensitivity of the patient but also a gray scale image to provide an overview of the result, numerous comparisons to normal age-matched control data, and indices that express the degree of abnormality with appropriate statistical probability.

Risk Factors for Glaucoma

Recent epidemiological data support past studies that assign a greater risk of glaucoma to certain groups. In screening for glaucoma, a questionnaire can be very effective in detaching those with the following high-risk characteristics:

- Blacks (risk of glaucoma 4 to 5 times higher than whites)
- Family history of glaucoma (risk up to 10 times that of the general population)
- Near-sighted persons (myopes)
- Diabetics
- Those with systemic hypertension
- Smokers

Therapy

The analogy between systemic hypertension and open-angle glaucoma is frequently made. Both involve an elevation of a physiological parameter that has long-term consequences in persons with other risk factors that predispose to injury. By no means do all persons with either form of high pressure suffer serious damage from the abnormality. In fact, there is a strong association between high blood pressure and high eye pressure.

The early phase of glaucoma damage are more easily observed and detected than is early damage to heart, kidney, or cerebrum by systemic hypertension. We are fortunate that examination of the optic disc, the retinal nerve fiber layer, and the subjective assessment of the visual field provide substantial information about whether the level of intraocular pressure has, in fact, injured the eye. As a result, the decision to treat the eye at risk for glaucoma depends in large part on whether damage to visual structure or function already exists.

In general, the present approach is to initiate therapy for any person who has evidence of optic nerve injury *or* whose risk of injury is judged to be substantial.

Initial Glaucoma Treatment

At present most ophthalmologists initially lower the intraocular pressure by prescribing eyedrops, usually beta adrenergic blocking agents (Timoptic®, Betagan®, or Betoptic®). These are used twice daily and have few ocular side effects. However, the systemic effects of eyedrops should be re-emphasized. Bradycardia, bronchospasm, and potentiation of congestive failure are not infrequent results of these agents. The therapeutic goal of the ophthalmologist is to lower the pressure substantially such that there is no further change in the parameters being monitored (disc, nerve fiber layer, and visual field).

Other glaucoma topical agents are used; the side effects of epinephrine (Propine®, Glaucon®, Eppy,® Epifrin ®) are obvious: tachyarrhythimias, elevations in blood pressure, and exacerbations of angina. Pilocarpine® drops cause few systemic effects.

Pills for glaucoma consist of carbonic anhydrase inhibitors (Diamox®, Neptazane®). These lead to a syndrome of lethargy, tingling in the extremities, and loss of appetite that limit their use in half those to whom they are prescribed. Furthermore, the infrequent but serious association with kidney stones, hypokalemia, and aplastic anemia have limited the use of these drugs.

Three new classes of drugs are being evaluated in human trials and may enter widespread use soon. The alpha adrenergic agonist group is represented by apraclonidine, a close molecule to clonidine (Catapres®). Additionally, carbonic anhydrase inhibitors are being evaluated in eyedrop form. In addition, prostaglandin F 2 alpha has been shown to lower eye pressure as an eye drop.

Laser Surgery

Laser surgery for open-angle glaucoma (argon laser trabeculoplasty [ALT]) occupies a place between medical and surgical treatment. A national collaborative trial is investigating ALT as initial therapy of glaucoma prior to medical treatment. This painless, outpatient treatment is widely used but rarely leads to total, long-term control of eye pressure. It is, however, a helpful adjunct. Few late complications have been recognized with ALT.

Operative Surgery

Surgery for glaucoma (trabeculectomy) is being evaluated in proposed trials as an earlier treatment, though it is reserved generally for use after medical and laser treatment have failed to halt progressive vision loss. This surgery aims to produce a controlled leak in the eyewall to act as a safety valve. It succeeds only when normal healing is suppressed. In the last three years, daily postoperative injection of 5-fluorouracil under the conjunctiva has been added to inhibit unwanted healing and to help keep open the drainage channel.

When standard glaucoma surgery to allow aqueous leakage fails, various energy modalities have been used to suppress the formation of aqueous humor. Cryotherapy has now been joined by transscleral laser techniques.

Angle-Closure Glaucoma

The most significant change in the treatment of this glaucoma is the replacement of surgical iridectomy by laser methods. With topical anesthesia on an outpatient basis the neodymium: YAG laser is now able to produce a hole in the iris to prevent or treat this form of glaucoma in nearly every susceptible eye.

Alzheimer's Disease Research at Johns Hopkins

Barry W. Rovner MD and Marshal F. Folstein MD

Dr. Rovner is an Assistant Professor Psychiatry and Behavioral Sciences and Dr. Folstein is the Eugene Meyer III Professor of Psychiatry and Medicine, The Johns Hopkins University School of Medicine, Baltimore.

The emergence of Alzheimer's disease from relative obscurity to front-page news is related to the increased life expectancy and increased proportion of the population over 65 years old. About 8 percent of the US elderly population suffer from the disease.

Alois Alzheimer described cognitive symptoms of amnesia, aphasia, and apraxia along with noncognitive symptoms of delusions and agitation in his classic case:

> A 51-year-old woman's show of jealousy toward her husband was the first noticeable sign of the disease. Soon a rapidly increasing loss of memory could be noticed. She could not find her way around her own apartment and she carried objects back and forth, hiding them. At times she would think that someone wanted to kill her and would begin to shriek loudly.

The postmortem examination of this patient led to Alzheimer's description of a "unique disease of the cerebral cortex" characterized by "a consistently atrophic brain" that revealed upon microscopic examination "peculiar changes of the neurofibril" and "miliary foci distinguishable by the deposit in the cerebral cortex of a peculiar substance". This was the first description of neurofibrillary tangles and neuritic plaques with amyloid cores now recognized as the characteristic pathology of Alzheimer's disease (AD).

The emergence of AD from relative obscurity to front-page news is related to the increase of life expectancy and the increase in proportion of the population over the age of 65. Because AD is an age-dependent disorder, the aging of the population will lead to greater numbers of affected people. Currently, about three million Americans, approximately 8 percent of the United States elderly population, suffer from AD.

Traditionally the disease has been referred to as the presenile onset of cognitive impairment and progressive decline, but recent epidemiological and pathological research suggests that presenile dementia differs little from the late-onset type, formerly called "senility" or organic brain syndrome. The major conceptional change that has occurred, however, is the recognition that "senility" is a neuropsychiatric condition due to specific diseases such as AD or multi-infarct dementia and is not an inevitable

consequence of aging. This change and the recognition that Alzheimer's dementia is a common and specific disease with certain clinical characteristics and a particular pathology have stimulated much of the research in AD at Hopkins. While we will emphasize the clinical rather than the basic science research, we acknowledge that we underestimate the breadth and richness of the latter endeavors and accomplishments.

Advances in Clinical Diagnosis

Clinical research at Hopkins began in 1979 with the establishment of the Dementia Research Clinic, a neuropsychiatric clinical and teaching program based in the Department of Psychiatry and Behavioral Sciences, that provides multidisciplinary evaluation, diagnosis, and continuing care for Alzheimer's patients and their families. This program is also the clinical arm of the National Institute on Aging's Alzheimer's Disease Research Center (ADRC) at Hopkins.

In 1984, Guy McKhann MD, Marshal Folstein MD, and others described the central clinical criteria for the diagnosis of probable AD, including the insidious onset and progressive decline in memory and other cognitive functions (Table 1). These criteria were adopted by the National Institute of Neurological and Communicative Disorders and Stroke (NINCDS) and the Alzheimer's Disease and Related Disorders Association (ADRDA) to facilitate the study of the natural history of the disease and to advance clinical, therapeutic, and pathological research.[1]

One of the NINCDS diagnostic criteria is the demonstration of cognitive impairment on neuropsychological tests. The Mini-Mental State Examination is among the most widely used tests for this purpose and for the longitudinal assessment of the clinical course in AD.[2] Approximately 90 percent of Hopkins ADRC patients show abnormalities on this scale, and their average rate of decline is 4 points per year. A modification of the Mini-Mental State Examination is the Telephone Interview for Cognitive Status, or TICS, which screens for cognitive impairment by telephone, expanding the screening potential of this assessment methodology.[3]

Table 1. Criteria for Clinical Diagnosis of Probable Alzheimer's Disease

- Dementia established by clinical examination and documented by the Mini-Mental Test, Blessed Dementia Scale, or some similar examination, and confirmed by neuropsychological tests
- Deficits in two or more areas of cognition
- Progressive worsening of memory and other cognitive functions
- No disturbance of consciousness
- Onset between ages 40 and 90, most often after age 65
- Absence of systemic disorders or other brain diseases that in and of themselves could account for the progressive deficits in memory and cognition.

Recent clinical studies of AD at Hopkins have focused on 210 patients enrolled in the ADRC who probably or possibly have AD. These studies describe the natural history of the disease with a focus on biological markers, behavioral and functional assessments, and predictors of prognosis. To determine if biological markers exist for AD, cerebrospinal fluid (CSF) from Alzheimer's patients was examined and found to have significantly lower acetylcholinesterase activity than did CSF from controls. (This enzyme is known to be reduced in AD brains.) Along with other CSF proteins such as Alz 50 and the Tau protein (components of abnormal neurofibrils), these CSF assays may become useful diagnostic tests to confirm the clinical diagnosis of AD.

Once the clinical diagnosis is made assessment of noncognitive psychiatric symptoms (such as depression) and functional abilities (such as driving) become important. Approximately 17 percent of AD patients exhibit a sustained change in mood and behavior characterized by depression, tearfulness, and feeling like a burden.[4] These depressed AD patients are more cognitively impaired and disabled in activities of daily living such as dressing and bathing than are nondepressed AD patients.

While depression might be an understandable reaction to having AD, two other possibilities exist. The first is that depressed AD patients may have a genetic vulnerability to depression. We found that the prevalence of depression in first-degree relatives of depressed AD patients is higher than the rate found in relatives of nondepressed AD patients. The second is that a particular neuropathology may exist in depressed AD cases. They have been found to have fewer noradrenergic neurons in the locus ceruleus of the brain, suggesting that some individuals have a distinct neuropathology that predisposes them to depression. Antidepressants improve the mood and functioning of some depressed, demented patients, making accurate recognition and prompt treatment important in the clinical care of AD patients. By improving our understanding of the neuroanatomy of depression, these studies may advance our knowledge of normal and abnormal neurophysiology of mood and refine our treatments of mood disorders in general.

Because AD patients may be at greater risks of having automobile accidents, a simple 20-item screening questionnaire was devised and administered to ADRC patients. Thirty percent had at least one accident since the onset of dementia, and an additional 11 percent were reported by caregivers to have caused accidents. We are now using a driving simulator to identify aspects of cognitive dysfunction such as memory, visual-spatial ability, and reaction time to predict unsafe driving habits and to enable us to counsel patients and families about the advisability of driving.

These studies of depression and driving underscore the fact that AD can be emotionally devastating to the patient and family. Research in the Dementia Clinic first reported the problems facing caregivers.[5] Table 2

lists patient behaviors that cause the most serious problems for caregivers, and Table 3 shows the problems caregivers face themselves. Practical solutions to these problems were provided in *The 36-Hour Day*,[6] a Hopkins publication that provides useful information about the disease and reminds caregivers that anger, helplessness, and fatigue (common feelings they will face) will need recognition and treatment.

Advances in Prognosis

One defining feature of AD is its inevitable progression. Because patients progress at varying rates, identifying prognostic features would help predict future care needs and possibly identify subtypes of the disease. We found that language impairment may be a distinguishing feature of early-onset AD predicting a more rapid decline. Other clinical features which may predict precipitous decline are extrapyramidal symptoms, myoclonus, and psychosis. Currently, we are enrolling recently diagnosed AD patients to study the prognostic value of these clinical features. Also, in an effort to identify the clinical features that will best predict nursing home placement, we have identified depression as one of the strongest, along with functional status and incontinence.

Advances in Treatment

While no primary treatments exist for AD, an experimental drug tetrahydroaminoacridine (THA) appears to reduce memory loss in a small group of AD patients. A multicenter trial is under way, and in Baltimore, the Francis Scott Key Medical Center is the participating center. Because early results have been encouraging, the study likely will continue to enroll new patients.

Until a cure or treatment is found, symptomatic treatments of behavioral symptoms are helpful. Antipsychotic medications commonly are used to treat delusions and hallucinations, however, they induce extrapyramidal side effects in a population prone to these symptoms. In comparing the efficacy and safety of haloperidol and thioridazine, Hopkins researchers found that while both drugs are equally effective in reducing hostility and irritability, thioridazine produced fewer extrapyramidal side effects and fewer complaints of fatigue.[7]

As mentioned earlier, nursing home placement is a frequent outcome for AD patients. In 1985 we developed a special Alzheimer's Care Unit in a local, proprietary nursing home owned by Meridian Healthcare. We compared the outcomes of AD patients residing on this unit with other AD patients in the same nursing home over a one-year period and found that the functional capacity of Unit patients remained stable over the period while that of nonunit patients declined. This study suggests the usefulness of Alzheimer's care units in nursing homes and indicates the need to provide this kind of care for AD patients in other nursing homes.

Advances in Research

Epidemiology To determine the prevalence and meaning of cognitive impairment in elderly dwelling in a community, 3,481 adults in East Baltimore were interviewed using the Mini-Mental State Examination, and a subset were examined by neurologists and psychiatrists. We found that the prevalence of dementia from all causes was 6.1 percent of this elderly population and 2 percent was due to AD.[8]

Epidemiological studies also were conducted in nursing homes to determine the prevalence of AD in this setting. We studied 454 consecutive patients newly admitted to eight Baltimore nursing homes and found that 80 percent had a psychiatric disorder.[9] The most frequent diagnosis was dementia (67.4 percent), most commonly due to AD. Forty percent of demented patients had additional psychiatric syndromes such as delusions or depression, constituting a distinct subgroup that predicted frequent use of restraints and neuroleptics. Data showed that AD was the most common diagnosis in Baltimore nursing homes and that care of demented patients is quite restrictive in terms of using physical and chemical restraints.

Neuroimaging Using a variety of neuroimaging techniques, Hopkins scientists are studying the anatomy and pathophysiology of AD. Single Photon Emission Computed Tomography (SPECT) scans are being used to measure cerebral activity based on regional cerebral blood flow. In AD, flow deficits in temporoparietal cortex have been observed. SPECT scanning also aids in the differentiation of Multi-Infract Dementia (MID) from AD. In MID, focal deficits in blood flow can be demonstrated indicating ischemic areas consistent with the vascular ethology. Also, MRI scans are being used to record brain changes over

Table 2. Behaviors Cited as Causing Serious Problems

Behavior	No. of Families Reporting	Families Reporting it as a Serious Problem No. (%)
Physical violence	23	18 (75)
Memory disturbance	37	25 (68)
Incontinence	21	13 (62)
Catastrophic reactions	45	25 (56)
Hitting	16	8 (50)
Making accusations	32	16 (50)
Suspiciousness	33	16 (48)

Table 3.Problems Caregivers Cite for Themselves (N-55)

	No.	%
Chronic fatigue, anger, depression	48	87
Family conflict	31	56
Loss of friends and hobbies, no time for self	30	55
Worry that caregiver will become ill	17	31
Difficulty assuming new roles and responsibilities	16	29
Guilt	14	25
None	4	7

time to separate mild, slowly progressive cases from normal aging and from more rapidly progressive cases. Finally, regarding neurophysiological abnormalities, PET scans are being used to quantitate opiate receptor activity in the amygdala as a possible premortem diagnostic test for AD.

Neuropathology Acetylcholine is a neurotransmitter known to be involved in memory. Neurochemical studies reveal that the enzyme which synthesizes acetylcholine, choline acetyl transferase, is significantly reduced in the cerebral cortex and hippocampus in AD patients. Hopkins neuropathologists have found that the major cholinergic innervation to the cerebral cortex derives from the basal forebrain. In AD there is a consistent and marked degeneration in a particular basal forebrain nucleus, the nucleus basalis of Meynert.[10] Thus, the cholinergic deficit in the cortex and hippocampus appears to result from degeneration in the basal forebrain. This discovery was an important first step in the identification of the specific neurochemistry and neuropathology of AD.

Molecular Genetics AD was associated with Down syndrome (DS; trisomy 21) about 25 years ago when neuropathologists found that most DS patients develop AD after age 40. Hopkins researchers have been studying DS patients and have found that some older DS patients develop depression and cognitive decline similar to AD.[11] Brain CT scans of DS patients also revealed that suprasellar cistern measures, an index of cerebral atrophy, correlate with the onset of dementia in DS as they do in AD.

Regarding etiology, chromosomal studies of DS patients and family members revealed that recombination on chromosome 21 is reduced, suggesting that DS may result from an error in meiosis. Furthermore, Joseph Coyle MD has studied trisomic 21 mice, thereby providing an animal model for a range of studies of chromosome 21.

Since DS results from triplication of chromosome 21, research in AD also has focused on this chromosome, and genetic mechanisms in AD have been proposed. A familial subtype of AD is known to follow an autosomal-dominant transmission. In 1984, using strictly defined AD cases and controls, we found that language disorder and agraphia strongly predicted familial aggregation of dementia. This general hypothesis later received support when researchers focused on the amyloid core of neuritic plaques. Based on the amino acid sequence of the amyloid protein, researchers identified the gene coding for amyloid on chromosome 21.[12] About the same time, a genetic marker on chromosome 21 was identified in four families with autosomal dominant AD, apparently near the amyloid gene location.[13] Identification of the amyloid gene and a gene marker for familial AD both on chromosome 21 suggests that the regulation of these genes may be important in the pathogenesis of AD.

To advance molecular genetic research in AD, Hopkins was recently awarded a $6 million grant by the National Institution on Aging. The Leadership Excellence in Alzheimer's Disease (LEAD) Award cites the work of Donald L. Price MD, Director of the Johns Hopkins ADRC. He and other neuropathologists at Hopkins are now studying the regulation of the amyloid gene. They will examine patterns of amyloid gene expression as a function of age and will compare levels of expression of the gene in regions vulnerable to the depositon of amyloid (frontal and temporal areas) with less vulnerable areas (occipital cortex and cerebellum). They also have begun to construct a linkage map for chromosome 21 based on DNA markers in 40 large families in which AD occurs frequently.

Taken together, these studies may clarify the mechanisms leading to the selective loss of specific neurons in AD and subsequently may direct therapeutic efforts to improve the condition or to prevent the its progression.

Highlights: Executive Committee and Council Actions

Executive Committee - November 16, 1989

All matters were referred to Council.

Council - November 16, 1989
380th Meeting

Committee Reports

Ad Hoc Committee for Maryland Blue Cross/Blue Shield Psychiatric Benefits - Dr. Louis C. Breschi, Chairman of the ad hoc committee, reported on the committee's deliberations concerning the recent change in psychiatric treatment benefits offered by the Med Chi Insurance Fund to physician members through the Greenspring Mental Health Services, an HMO organization sponsored by Maryland Blue Cross and Blue Shield. Following lengthy discussion and consideration of a resolution presented by Dr. Breschi, Council amended the resolution, which was adopted as follows:

> RESOLVED, That the Medical and Chirurgical Faculty of Maryland oppose utilization review involving patient contact; and
> RESOLVED, That the President of the Faculty appoint a Task Force to develop a proposal for a managed care system for psychiatric services acceptable to the Med Chi Insurance Fund. The Task Force shall include but not be limited to representation from the Maryland Psychiatric Society, Suburban Maryland Psychiatric Society, Psychoanalytic Societies, the Maryland Society for Adolescent Psychiatry; and representatives from appropriate psychiatric utilization review organizations in the State of Maryland.

Committee on Hospital Medical Staffs

Springfield Hospital Center Dr. Victor R. Hrehorovich, Chairman, briefed Council on the involvement of the Faculty's Committee on Hospital Medical Staffs in the mediation of differences between the medical staff and the administration of the Springfield Hospital Center and presented a resolution for the Council's consideration. Following discussion and a minor modification, the resolution was adopted unanimously by the Council as follows:

> RESOLVED, That the Faculty support the Medical Staff of Springfield Hospital Center by issuing a generic statement (Amicus Curiae) regarding the proper framework for self governance of Medical Staff activities and accountabilities to the governing body; and
> RESOLVED, That the Faculty make available its resources to both parties to mediate and resolve problems to the ultimate benefit of patients cared for at Springfield Hospital Center.

It was pointed out that any time legal action is required in matters such as this the issue must be brought before the Med Chi Council for approval.

Credentialing Following Dr. Hrehorovich's presentation of the recommendations of the Committee on Hospital Medical Staff, the Council discussed at great length the proposals of the committee for the establishment of a professional credentialing records service as a joint venture with the Maryland Hospital Association. After much debate over the issue and several amendments, the Council adopted the following recommendations:

> That the Council authorize the Executive Director to proceed with negotiations with the MHA to establish Professional Credentialing Record Service, Inc.; and
> That the Executive Director continue to refine Med Chi's own Credentialing Program. Should negotiations with MHA be successful, the Faculty's Credentialing Record Program will fold into the new corporation; and
> That if the joint venture does not occur, the Faculty will continue with its own credentialing program.

Committee on Young Physicians Dr. Susan W. Owens presented to Council the results of a recent Survey of Young Physicians. The survey reported figures in areas such as age, sex, location, financial debt, personal income, top priorities in life, average total hours per week, etc. The report proved to be informative as well as interesting to members of the Council, and Dr. Owens was recognized for her hard work with a round of applause.

Committee on Drugs The Council accepted the Committee's report and acted upon the recommendations contained therein as follows:

a. Granted approval of correspondence to be sent to the Division of Drug Control and the Board of Physician Quality Assurance regarding referrals of routine pharmacy surveys.
b. Approved the committee's request for correspondence to be sent to the Division of Drug Control approving the changes to COMAR 10.13.10.

Peer Review Committee Dr. Nagel informed the Council that the Executive Committee had discussed the recommendations contained in the report of the Peer Review Committee concerning the request for a Faculty policy on the payment of dinner by committee members, and the scheduling of committee meetings to avoid parking problems. He reported that the Executive Committee agreed that all committee members who desire to have dinner during the Faculty committee meetings are responsible for payment of such dinners, and committee meetings shall continue to be scheduled at the convenience of the committee members. The Council concurred in the decision of the Executive Committee.

Emeritus Membership Council approved the following physicians for Emeritus Membership in the Faculty as requested by the component society indicated:

Baltimore City
Talmadge H. Pinkney MD, *Baltimore*
Montgomery County
Kenneth Cruze MD, *Silver Spring*

Arthur J. Levens MD, *Olney*
Richard C. Myers MD, *Bethesda*

Wicomico County
Harold N. Eccleston MD, *Parsonburg*
Aubrey C. Smoot, Jr., MD, *Salisbury*

These names will be presented to the House of Delegates for consideration at its 1990 annual session.

White Papers Draft copies of "white papers" on "The Problem of the Uninsured," "Allied Professions," and the "Physician Role in Business Enterprises" were distributed to Council for consideration of approval. The Council adopted the proposed position on "The Problem of the Uninsured" with one minor amendment. Many members were concerned with the wording of the "Allied Professions" position paper that resulted in a motion, duly seconded and adopted, to refer this paper back to Dr. Murray A. Kalish to be coordinated with Susan R. Guarnieri MD, Chairman of the Legislative Committee, for review and revision. The "Physicians Role in Business Enterprises" proposed position paper was defeated.

Semiannual Meeting - Dr. Ernest E. Harmon, Chairman-Elect of the Committee on Scientific Activity, requested Council's approval of the proposed site and dates for the 1990 Semiannual Meeting - the Southhampton Princess Hotel in Bermuda, September 5-9, 1990. Dr. Harmon stated that past meetings at this location provided top service and first class accommodations and that the hotel has agreed to hold 50 rooms without deposit. After discussion, the Council approved the site and dates for the 1990 Semiannual meeting, and directed that, as recommended by the Executive Committee, a registration fee of $500 be charged each attendee.

1990 Meeting Dates - Council approved the proposed meeting dates for 1990 as follows:

Thursday, January 18, 1990, 4:00 p.m.
Thursday, February 15, 1990, 4:00 p.m.
Thursday, March, 15, 4:00 p.m.

Annual Meeting, Turf Valley Hotel and Country Club
Wednesday, May 9, 8:30 a.m.
Friday, May 11, 1990 (immediately following the 2:00 p.m. House of Delegates meeting)

Semiannual Meeting, Faculty Building
Saturday, September 15, 1990, 10:00 a.m.

Thursday, October 18, 1990, 4:00 p.m.
Thursday, November 15, 1990, 4:00 p.m.

State Commission on Kidney Disease Nominations The Council approved the following names for nomination for a position on the State Commission on Kidney Disease:

Mark Rubin MD (Nephrology)
Frederick County
Steven Pollak MD (Internal Medicine, Nephrology)
Prince George's County

Oregon Medical Association Dr. Louis Breschi, Chairman of the Committee on Professional Ethics, requested the Council's approval of a letter to the Oregon Medical Association urging the association to oppose the placement of the "Death with Dignity Act" on the Oregon ballot. The letter points out that taking such a position will enable patients to continue to rely on physicians, rather than legislation, when they are confronted with death and dying issues. After discussion, the Council voted to refer the matter to the Faculty's President with the request that he contact the President of the Oregon Medical Association by telephone to discuss the issue and to report back to the Council at its next meeting.

Resolution Supported Dr. Robert Kent, a member of the Committee on Physician Rehabilitation, on behalf of the committee, requested Council's support of the New Jersey Medical Society's resolution entitled, "Funding of AMA's Physicians' Assurance Program." After a brief discussion, the Council rendered a vote of support and referred the matter to the AMA Delegation with the recommendation that the delegation support the resolution during the AMA Interim Meeting in December.

New Council Member The chairman, Dr. J. David Nagel, introduced Dr. Kenneth B. Lewis, Council representative of the Faculty's Committee on Specialty Societies, who was welcomed with a round of applause by the members of Council.

Auxiliary Mrs. Vicki Cameron, Auxiliary President, was on hand to give a brief report on the activities of the Auxiliary. Some highlights of the report included the addition of Kent County into the Auxiliary membership and the involvement of the Auxiliary in a child abuse project. A formal report will be submitted at a later date.

Workman's Compensation - Prince George's County The Council approved intervention by the law firm of Rifkin, Evans, Silver, and Lamone on behalf of Dr. Joel Falik in a lawsuit originating in Prince George's County. The lawsuit revolves around the issue of physician fees prescribed by the Workman's Compensation Commission's *Guide of Medical and Surgical Fees*. The Faculty is authorized to file an amicus curiae brief expressing its concern about the current fee structure.

Executive Committee - December 21, 1989

Committee on AIDS The Committee's report of November 15, 1989 was accepted with no recommendations. Dr. Dobridge suggested that the Committee on AIDS be informed of the recent AMA decision that persons in contact with the AIDS virus be appropriately tracked.

Finance Committee Dr. Yosuico, Chairman and Treasurer, presented the Finance reports of November 20 and December 18, 1989. He pointed out that the Finance Committee had amended its November 20, 1989 minutes to indicate that its recommendation was for the Executive Director to investigate the "usage" of

the Library; not the "costs" as indicated in the November 20 minutes. Mr. Troisi informed the Executive Committee that part-time staff in the Library was doing an adequate job, and it may not be necessary to hire additional full-time employees at this time.

Regarding the possibility of capitalizing on the Library's old book collection, estimated to be worth approximately $6 million, the Library Committee requested that the issue be tabled until a joint meeting could be held with the Library Committee and the Finance Committee to discuss the issue further. Following discussion, the Executive Committee adopted a motion to table the issue until the two committees could meet to evaluate the assets of the Library as a whole, followed by a report with recommendations to the Executive Committee and Council.

1990 Budget Dr. Yosuico presented the proposed 1990 budget, which was reviewed by the Executive Committee. The proposed budget will be forwarded to the Council for consideration during its January meeting.

Legislative Committee Report of October 25, 1989, accepted; no action required.

Gerry Evans gave a verbal report of the Committee's meeting of December 20, 1989. During the discussion, it was noted that Med Chi's present position is in opposition to all smoking. A motion was adopted to support the Legislative Committee in the introduction of legislation, as follows, concerning the sale of cigarettes:

1. The sale of cigarettes and other tobacco products to people under the age of 21 would be illegal.
2. The sale of such items to those individuals under that age of 21 would result in the loss of one's license to sell all tobacco products. A one-time warning shall be given without monetary consequence.

Liaison Committee with Medical Assistance Program Correspondence from Nelson J. Sabatini, DHMH, dated November 27, 1989, in response to Med Chi's suggested changes in the payment schedule for emergency physicians under the Medicaid Diversion Plan, was accepted by the Executive Committee. It was agreed that no further communication on this issue would be required. Michael Murray gave a brief verbal report on the Committee's meeting of December 20, 1989.

Committee on Professional Ethics The Executive Committee was informed that in accordance with the committee's request and as directed by Council at its meeting of November 16, 1989, staff had contacted the Oregon State Medical Society (OMS) and learned that the OMS is not supporting the "Death with Dignity Act" in that state. They have accepted the position of the AMA: physicians should not participate in assisting in the demise of individuals.

Committee on Public Health The Committee's report of December 6, 1989, was accepted.

Municipal Health Services Program The Executive Committee discussed the issue surrounding the Municipal Health Services Program and the Public Health Committee's draft letter referring the matter to the Baltimore City Medical Society. Dr. Dobridge moved to amend the letter by adding a sentence to express Med Chi's grave concern that this program could have a detrimental effect on the practice of the private physician and other health care providers in eastern Baltimore City. The motion was adopted, and the letter will be sent to the BCMS as amended.

National Cancer Institute The Subcommittee on Maternal Welfare submitted recommendations relative to a grant awarded to the Department of Health and Mental Hygiene by the National Cancer Institute for the detection and treatment of breast cancer and cervical cancer in Maryland. It was agreed that the committee should continue its coordinating efforts with the Department.

Public Relations Committee The Public Relations Committee report of November 15, 1989 was accepted, and the following recommendations contained in the report were considered:

1. That the committee conduct a promotional campaign to encourage readers to read the *Maryland Medical Journal*;
2. That the Faculty bylaws be changed to *require* Councilors' and Delegates' to report to their local component societies following Council meetings; and
3. That an open forum regularly be included on the Council's agenda to allow the membership to air their concerns regarding the society and medicine.

Item 1 was tabled until such time as the Public Relations can provide cost figures involved in conducting such a campaign.

Item 2 - It was pointed out that because the councilors and delegates to Med-Chi are elected by their respective component societies, it was within the purview of the component societies to require reports from their representatives. However, Dr. Nagel stated that members of the Council and the House of Delegates will be reminded to report back to their component societies following their attendance at meetings of the Faculty.

Item 3 - Faculty members are expected to work through their component societies and through their representatives to Med Chi to make their views known. Also, it was noted that a general meeting is held during the Faculty's annual and semiannual sessions if a member wishes to address an issue.

Agenda Items

Maryland Health Convocation The proposed format for the Tenth Annual Convocation was reviewed. Following discussion, the Executive Committee decided to recommend to Council the approval of $2,500 in support to the Maryland Health Convocation for the year 1990.

Blue Cross/Blue Shield of Maryland - Medicare Dr. Louis C. Breschi, Chairman Committee on Specialty Societies, was present to discuss Dr. Barry S. Gold's letter regarding the revision of medical policies for the

reimbursement of GI endoscopies and noninvasive vascular testing, and also to discuss the responses received by physicians directly involved in these areas. The proposed changes and the Executive Committee's decisions are as follows:

Blue Cross/Blue Shield of Maryland/Medicare proposes the following policies and policy changes regarding noninvasive vascular testing:

1. All studies should be considered bilateral and reimbursed as one procedure.
2. Postoperative studies are not reimbursed unless the patient is symptomatic.
3. Saphenous system mapping and carotid studies done prior to CABG should not be routinely reimbursed.
4. Higher fees for color doppler studies should not be routinely paid.
5. Posterior circulation T/A studies should not be routinely reimbursed.
6. Studies for asymptomatic bruits should not be routinely reimbursed.

In its deliberations, the Executive Committee concluded that it is strongly opposed to revised policies 2, 3, 5, and 6, but neither supports nor opposes policies 1 and 4. The major concern regarding proposals 2, 3, 5, and 6 relates to denial of reimbursement for noninvasive studies that were done on asymptomatic patients. The evidence is very strong, to date, that the value of noninvasive studies is their ability to identify disease processes before they become symptomatic and at a time when they can be corrected with minimum injury to the patient. To deny this condition will deprive the patient of optimal medical care.

Blue Cross and Blue Shield of Maryland/Medicare proposes the following in regard to Gastrointestinal endoscopies:

Gastrointestinal endoscopic procedures are considered diagnostic surgical procedures that are a covered service when reasonable and necessary for the individual patient. Although primarily a diagnostic tool, endoscopy includes certain therapeutic procedures such as polypectomy, and endoscopic papillotomy, by which stones are removed from the bile duct.

The reimbursement of an endoscopy above is coverable providing it is medically necessary. Incidental biopsies and cauterizations should not be paid as separate procedures (i.e., endoscopy plus polypectomy involves unusual risk and time and thus is allowed as a separate procedure when performing any endoscopy). The unrelated surgical procedure ruling will be applied for the aforementioned.

Following discussion, the Executive Committee concluded that an additional, reasonable charge for incidental biopsy is appropriate but that an additional charge for incidental cauterization is not.

It was recommended, however, that cauterization as a part of the biopsy may be appropriate for payment under complicated, more difficult, procedural circumstances.

The Executive Committee agreed that the above opinions should be offered to Dr. Gold, with the proviso that the Committee on Specialty Societies will meet to discuss the issues further, if he wishes to do so.

Delmarva Foundation A letter of December 12, 1989 from the Delmarva Foundation regarding their proposal submitted to the HCFA on the Office-based Review Pilot Program was discussed. The Executive Committee agreed that it should be brought to the attention of Dr. Wroth, Medical Director of the Delmarva Foundation, that Med Chi supports the position of the AMA as outlined in Report K of the AMA Board of Trustees, which takes opposition to such a program being instituted.

Fee Cases - BCMS Proposal The Executive Committee discussed at length a letter from the Baltimore City Medical Society (BCMS), dated November 29, 1989, in regard to its opposition to the introduction of legislation relative to the processing of fee disputes that do not fall within the purview of the Board of Physician Quality Assurance. During the discussion, Mr. Evans recommended, and the Executive Committee concurred, that Med Chi should meet with the members of the Board to discuss their interpretation of the law before taking any action on the issue. Dr. Nagel suggested that the chairmen of the Peer Review Management Committee and the Peer Review Committee, along with members of the Executive Committee and appropriate staff, also should attend the meeting with the Board of Physician Quality Assurance.

Marilyn Goldwater A letter from Marilyn Goldwater, Director of the Office of Federal Relations, DHMH, expressing appreciation for the use of Med Chi's facilities and for staff assistance rendered during the conference held in Osler Hall on November 15, 1989 was received for information. It was reported that Ms. Goldwater had requested financial assistance from Med Chi for expenses incurred in presenting this conference. The Executive Committee voted to refer the matter to the Med-Chi Insurance Fund (Agency) with a recommendation that $300 be expended for this purpose.

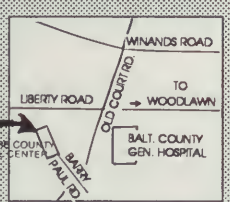
Old Business

Proposed 1990 Meeting Dates The Executive Committee approved the proposed meeting dates for 1990. They are:

Thursday, April 19, 1990, 4 p.m.
Thursday, June 14, 1990, 4 p.m.
Thursday, July 19, 1990, 4 p.m.
Thursday, August 16, 1990, 4 p.m.
Thursday, December 13, 1990, 4 p.m.

Credentialing Program Dr. Victor R. Hrehorovich, Chairman, Committee on Hospital Medical Staffs, and Dr. Rafael C. Haciski, Chairman, Computers in Medicine Committee, presented a detailed, updated report on the Credentialing Program. Included in their presentation was a comparison of Med Chi's program and the proposed program by the MHA.

Springfield Hospital Dr. Hrehorovich also gave a verbal, updated report on the Springfield hospital issue. Dr. Hrehorovich pointed out that there will be no changes in the bylaws of the Springfield Medical Center and the hospital medical staff is proceeding with their suit.



Greenspring Managed Care System, Inc. Dr. A. Carl Segal's letter of December 7, 1989 concerning Greenspring's changes in its psychiatric coverage was distributed for information. Following a brief discussion, it was decided that a letter (under Dr. Nagel's signature) be sent to the Chairman of the Med Chi Insurance Fund (Agency) requesting clarification of how the changes in Greenspring's payment for psychiatric services was affecting Med Chi's subscribers. ■

Attman Brokerage Services, Ltd.

Presents

Baltimore County Professional Building

Location	:	Barry Paul Road just off Old Court Road near the intersection of Liberty Road and down the street from Baltimore County General Hospital.
Total Square Footage	:	10,320 square feet, minmum bay size is 1,720 square feet
Rental Rate	:	$12.00 per square foot net
Additional Expenses	:	Taxes, building insurance and common area charges are the responsibility of the Tenant. Expenses are estimated to be $2.00 per square foot.
Utilities	:	Tenant will be separately metered and responsible for its own utilities.
Ocupancy	:	Immediate
Term of Lease	:	A minimum of three (3) years. Five year terms or longer are preferred.
Amenities	:	Individual entrances, restroom facilities, heating/air conditioning controls in each suite.

NOW LEASING

Make Child Abuse a Memory

The case of Joel Steinberg and Hedda Nussbaum put child abuse in the headlines early last year. That tragic story was almost unbelievable in terms of who was involved and the suffering endured. But what the headlines didn't talk about are the thousands of faceless children whose lives are forever marred by the same tragedy: children who are little more than statistics in a social worker's files, in hospital records, or in police dockets.

These are the grim facts. Two hundred thousand children are physically abused each year, eight hundred thousand are neglected, and sixty thousand to one hundred thousand are sexually abused. Of the one million children who are abused each year (and the number of reported cases continues to grow every year) two thousand to five thousand will die. The statistics are frightening. But even more frightening and very upsetting is the fact that child abuse is a preventable problem. Preventable, that is, if concerned people join together to prevent it through education, awareness, and support programs.

What constitutes child abuse? Child abuse and neglect include physical, emotional, and sexual abuse as well as negligent treatment or maltreatment of a child under age eighteen by a parent or caretaker.

The AMA distinguishes between abuse and neglect in this way: child abuse includes physical abuse, such as external or internal injuries; sexual abuse as incest, molestation, or the use of children in pornography; and emotional abuse as verbal attacks or excessive demands on a child's performance. Child neglect includes physical neglect, such as abandonment, inattention to medical needs, incomplete provision of basic needs, and disregard for a child's safety; educational neglect, such as failing to enroll the child in school or permitting chronic truancy; and emotional neglect, such as inadequate nurturing or affection.

These problems do not just plague young children, they trouble adolescents as well. In fact, statistics show that adolescents make up 17 to 30 percent of the one million cases of child abuse and neglect reported in the United States each year. Half of all rape victims are under eighteen. One and one half million children and adolescents turn up missing every year. Some just run away, and others are turned out of their homes by their own parents. The abuse of adolescents also includes pornography and prostitution.

Who causes or allows these terrible problems to happen? People do. People who are often friends, neighbors, and relatives. An AMA study found that biologic parents most often are involved in child maltreatment. However, foster parents, adoptive parents, grandparents, siblings, other relatives, friends, and a host of other people who provide care for children inside and outside the home also can be involved.

Child abuse and neglect are not exclusive province of the poor. Abusers come from all economic, racial, ethnic, and religious groups. Research shows that those who abuse and neglect children are often socially isolated people with negative self-images. They also may exhibit such traits as unrealistic expectations of children and inability to cope with stress. Problems such as unemployment, marital conflict, chronic illness, alcoholism, and drug abuse may provoke a parent to abuse a child or to overlook a child's needs.

Often, people who abuse or neglect children were themselves abused or neglected when they were young. Another characteristic of abusers is that they often delay in seeking help for an injured child, and when they do, the description of how the injury occurred does not fit the medical findings.

In addition to the characteristics of abusers, research has brought to light some other factors that contribute to abuse and neglect. Child abuse and neglect occur in socially isolated families that have no external support systems, in families where husbands and wives abuse each other, in families where one parent was mistreated as a child, in families in which parental expectations are inconsistent with a child's developmental abilities, in families in which stressors such as alcohol and drug misuse, inadequate housing or overcrowding and mental illness are present. Child abuse also may occur when a child is different or has special needs; for example, illegitimate children, those born of unplanned pregnancies, those who have physical or mental handicaps, or children with chronic illnesses may be abused. Sometimes one child in a family is singled out while others live relatively normal lives.

Whatever the cause, the psychological and physical effects of abuse and neglect can be profound with some victims suffering permanent damage. Many mistreated children have problems in school or turn to crime, drug, or alcohol abuse. Some may, as adults, abuse their own children.

As grim as this picture sounds, however, the news is not all bad. The good news is that research focused on identifying parents at high risk of abuse and neglect are leading to the development of intervention and prevention programs. Among them are parenting education, programs to strengthen family units, education and awareness, and outreach programs, such as hotlines or self-help groups, that provide an outlet for the stresses of parenting.

These programs work especially well at the local level where they are easily accessible to those who need them. For example, support programs for new parents can help prepare people to be a positive influence on their children and show them how to develop loving relationships and strong attachments between themselves and their children. Educational programs can

give parents information about child development, provide skills in child care, and put them in touch with community resources. Screening and treatment programs can help identify and deal with physical and developmental problems in children as well as helping parents learn and develop well-child care skills. Child care opportunities, such as day care centers, neighborhood babysitting services, and nurseries, can help reduce the stress new parents sometimes feel. Self-help groups, such as parents anonymous and foster grandparents or parent aides, can help reduce social isolation. Family support services, such as crisis intervention centers, hotlines, and counseling for alcohol and drug abuse, can provide an outlet for parents.

Public information and education programs can create an awareness of what child abuse and neglect are, why they happen, and how they can be prevented. They can also help people understand the signs of child abuse and neglect, signs such as repeated injuries for which unlikely explanations are given; passive, withdrawn, or disruptive behavior on the part of a child; neglected appearance or a child being left alone for long periods or during evening hours.

Many people who suspect a child is being abused or neglected don't want to get involved. They know any parent can make errors in judgment that may look like abuse to people outside the family. Yet people should be encouraged to get involved by contacting one of the local service agencies that can get help for the child and family, local child protective service agencies, welfare departments or social service agencies, public health authorities, and police. Physicians, too, should be encouraged to look for the signs of suspected abuse and to report them to authorities.

There are two goals for programs to help prevent child abuse. One is to make sure that the child is safe, and the other is to resolve the family problem that brought on the abuse. These goals are at the heart of programs developed by our peers in medical auxiliaries across the nation as they work to help prevent child abuse.

Whatever you choose to do, remember that as auxiliary members of an organization committed to improving the health of the people of this nation we cannot help but become involved in programs that will help prevent child abuse. We believe that child abuse shouldn't happen, and we know that it won't stop happening until we stop it from happening.

Programs to prevent child abuse are our way of saying that we care and our way of doing our part to see that the one million children who are abused each year get a better start on life.

Let's do our part. Let's help make child abuse a memory.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

For more information contact Besty Newman at 301-539-0872 or in MD 1-800-492-1056.

Gastroparesis Diabeticorum

Doctor, I have been having abdominal distress and my abdomen has felt distended off and on for several months. Sometimes I have heartburn and occasionally some nausea. Other times my abdomen feels fine. The only change in my dietary habits is that I have increased the fiber in my meal plan to lower my cholesterol and to make my diabetes more stable as recommended by some newspaper articles. What is the cause of my problem? What can I do about it?

Since you have had diabetes for about twenty years and have some signs and symptoms of peripheral neuropathy it is probable that you also have some degree of visceral neuropathy. If it is present in the region of the stomach, some decrease in vagus nerve function is manifested by gastric cavity enlargement, sluggish gastric emptying, decreased motility without pyloric stenosis. This is called gastroparesis diabeticorum and is present in 20 to 30 percent of patients having long-standing diabetes. Fortunately most of the patients with this problem are asymptomatic, but it is by no means uncommon to see patients with your type of symptoms.

The diagnosis of gastroparesis diabeticorum requires exclusion of other causes of gastric function such as vagotomy, gastric malignancy, peptic ulcer, and drug-induced motility dysfunction from tranquilizers, anticholinergics, ganglion blocking agents, and tricyclic antidepressants. The usual findings on upper gastrointestinal x-ray series are sluggish, ineffectual, and irregularly occurring gastric peristalsis with delayed emptying of the contrast medium. The pylorus is widely patent, and it may be necessary for the examiner to externally compress the abdomen to force barium into the duodenum to demonstrate pyloric patency.

In your case the use of the high-fiber diet probably brought on your symptoms. Although the American Diabetes Association recommends "up to 40 grams per day of fiber particularly the soluble form of fiber found in beans, oat bran products, and fruit," patients with gastroparesis diabeticorum should avoid high-fiber diets because of the possibility of phytobezoar formation.

Treatment begins with the exclusion of other causes of abdominal distress and confirming the diagnosis of gastroparesis diabeticorum. Next begin a liquid diet with frequent small feedings to promote gastric emptying. Gradually progress to a blenderized diet and solids as tolerated. In most cases the diet can be planned with regular foods and the exchange lists within a few days.

Cholinergic agents such as bethanechol (Urecholine®) cholinesterase inhibitors such as ambenonium chloride (Mytelase®) have met with variable success, but often are associated with side effects. The most promising agent for the treatment of gastroparesis diabeticorum is metoclopramide (Reglan®), which stimulates contraction of the smooth muscle of the gastrointestinal tract. In addition, the mechanical effect of lying on the right side to promote gastric emptying has been found to give relief when abdominal discomfort is present.

Incidentally, the presence of delayed gastric emptying in this condition often has accounted for poor diabetic control and particularly episodes of hypoglycemia.

Finally, if the meal plan is to be modified at any time by a patient with diabetes, it is desirable to do it with the counseling of a dietitian to prevent such a problem as described.

Baltimore County Medical Association

At the Baltimore County Medical Association's (BCMA) Annual Meeting in January, *Esther Edery MD* was installed as President. A practicing Pediatrician in the Towson area since 1970, Dr. Edery is a member of the medical staff of St. Joseph Hospital and Greater Baltimore Medical Center. Dr. Edery is a graduate of the University of California, Berkeley, and received her medical degree from the National University of Mexico in Mexico City. She served her internship at St. Agnes Hospital and her residency at the University of Maryland Hospital.

An active member of the BCMA since 1971, Dr. Edery has served on the Board of Governors since 1984 as well as being a member of County Executive Rassmussen's Health Department Focus Group. She presently chairs the subcommittee on Maternal and Child Care Issues for that group.

At the same Annual Meeting, *Harold B. Bob MD* was installed as President-Elect of the BCMA. Dr. Bob received both his BA and MD degrees from the State University of New York at Buffalo. He did his internship and residency at Wilmington Medical Center in Delaware. Dr. Bob, a Family Practice physician, has had an office in Pikesville since 1976, is a member of the medical staff of Baltimore County General Hospital, and is a past-president of the Baltimore County General Hospital Foundation.

He has been an active member of the BCMA since 1982 and has served as Chairman of the Public Relations Committee, Moderator for the monthly TV show, "Ask the Doctor," Chairman of the Program and Bylaws Committees, a member of the Board of Governors, and Secretary and Vice-President of the BCMA. Dr. Bob is presently the Secretary of Med Chi, a member of the AMA and of the American Academy of Family Physicians.

Louis C. Breschi MD was installed as Vice-President. Dr. Breschi has been active member of the BCMA serving as Secretary, treasurer, a member of the Board of Governors, and Chairman of the Ethics Committee. Now serving as Chairman of both the Professional Ethics Committee and the Committee on Specialty Societies of Med Chi, Dr. Breschi is a Urologist on the staffs of Franklin Square Hospital Center, Good Samaritan Hospital, and St. Joseph Hospital.

Marianne Benkert MD was installed as Secretary of the Association. Dr. Benkert has served on the BCMA Board of Governors since 1986, and previously served as Chairman of the Peer Review Committee in 1986, and Chairman of the Budget, Finance and Personnel Committee, as well as Treasurer in 1989. She is a member of Med Chi's Committee for Women in Medicine and is Chairman of the Maryland Psychiatric Society's Committee for Women as well as on that Society's Peer Review Committee. Dr. Benkert is an active member of the St. Joseph Hospital Medical Staff and has a private medical practice with a specialty in psychiatry.

Esther Edery MD, President (left), receives the ceremonial cane from Benjamin V. Del Carmen MD.

Installed as Treasurer of BCMA was *Albert L. Blumberg MD*, a member of the Association, Med Chi, and the AMA since 1982. He currently serves as Chairman of the Membership and Medical Legislation Committees of BCMA and on the Board of Governors. Dr. Blumberg specializes in Radiation Oncology. A 1974 graduate from Jefferson Medical College, where he also served his internship, he did his residency in Radiation Oncology at the University of California. He is an active member of the medical staff of the Greater Baltimore Medical Center. ■

Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

In the Matter of Raymond F. Bayerle MD Before the Maryland Board of Physician Quality Assurance

Final Decision

Background

The Board of Physician Quality Assurance (the Board) issued charges against Raymond F. Bayerle MD (Respondent) on October 7, 1988 pursuant to its authority under Health Occupations Article, *Annotated Code of Maryland* (HO) Section 14-504. Specifically, the Board charged Respondent as follows:

(2) fraudulently or deceptively uses a license;
(3) is guilty of immoral or unprofessional conduct in the practice of medicine, and
(28) sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes.

The Board, on October 7, 1988, also issued as Summary Suspension of Respondent's License to Practice Medicine on the basis of its finding that the public health, safety, and welfare imperatively required emergency action in this case pursuant to Maryland State Government Code Annotated, Section 10-405 (1984).

A prehearing conference was conducted on October 27, 1988. It was determined at the prehearing conference to postpone the hearing until such time as the criminal charges pending against Respondent were resolved.

The hearing, reschedule until May 25, 1989, commenced 10 a.m.

Summary of Evidence

The following Exhibits were submitted by the Administrative Prosecutor for admission into the record. There was no objection by counsel for Respondent, and they were duly entered into the hearing file.

State Exhibit A The *Charges Under the Medical Practice Act* issued on October 7, 1988, alleging that Respondent sold prescriptions for Dilaudid to undercover officers of the Baltimore County Police Department on several occasions in September, 1988; none of the police officers had a patient-physician relationship with Respondent; and Respondent's Maryland Controlled Dangerous Substance Registration expired on June 30, 1988, prior to the issued prescriptions.
State Exhibit B The Order for Summary Suspension of License to Practice Medicine issued by the Board of Physician Quality Assurance on October 7, 1988.
State Exhibit C Warrant for Arrest and Criminal Complaint issued in Case Number 88-0049G by the United States District Court against Respondent on September 21, 1988.
State Exhibit D True Test Copy of the criminal indictment filed on September 28, 1988, against Respondent, Criminal No. HAR 88-0336.
State Exhibit E Criminal Information filed on April 21, 1989, against Respondent for Evasion of income Taxes, Criminal Number 89-0112.
State Exhibit F Undated Plea Agreement between Respondent and United States Attorney, resulting from Criminal Information 89-0112.
State Exhibit G Photocopy of State of Maryland Medical License issued to Respondent with expiration date of September 30, 1986.
State Exhibit H Photocopy of State of Maryland Medical License issued to Respondent with expiration date of September 30, 1988.
State Exhibit I Photocopy of State of Maryland Controlled Dangerous Substances registration No. M 15994 with expiration date of June 30, 1988.

Counsel for Respondent submitted the following Exhibits for admission into the record. There were no objections from the Administrative Prosecutor, and they were admitted into the hearing file.

Respondent Exhibit 1 Pretrial Evaluation for Dangerousness, dated November 23, 1988, performed by Jonas R. Rappeport MD.
Respondent Exhibit 2 Forensic Evaluation dated February 22, 1989, performed by Lee Larcade MD, and Sally Johnson MD, and Kevin J. McBride PhD pursuant to Magistrate Chasanow's Court Order of December 2, 1988.
Respondent Exhibit 3A Evaluation, dated May 1, 1989, by Joseph F. Chambers MD, of the Physicians Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland.
Respondent Exhibit 3B Results of the Minnesota Multiphasic Personality Inventory, performed April 18, 1989.
Respondent Exhibit 3C Questionnaire About Drinking Habits completed by Respondent on April 18, 1989.
Respondent Exhibit 4 Psychiatric Evaluation of Robert L. Custer MD, the treating psychiatrist for Respondent.

There were no witnesses for the State. Respondent testified in his case. Counsel stipulated as to the allegations in State Exhibit A.

By letter dated June 14, 1989, the Hearing Officer submitted a Recommended Decision including proposed Findings of Fact, proposed Conclusions of Law and Order to the parties advising the parties of the right to file exceptions under the Administrative Procedure Act. By hand delivery, on November 13, 1989, the Board informed the parties that having received no exceptions, the case would be considered by the Board at its meeting on Wednesday, December 13, 1989. By a majority vote of the full authorized membership of the Board, the Board issues the following decision.

Findings of Fact

By clear and convincing evidence, the Board finds that: Counsel for Respondent and the Administrative Prosecutor stipulated as to all of the allegations contained in the Charging Document. All findings are supported by clear and convincing evidence: the stipulations of counsel; State Exhibits A, B, C, D, E, F, G,H, and I; and the undisputed and credible testimony of the Respondent.

1. At all times relevant to the charges, Respondent was licensed to practice medicine in Maryland. State Exhibits G and H are photostatic copies of

Respondent's medical license from the State of Maryland expiring on September 30, 1986 and September 30, 1988, respectively.

2. Respondent's Maryland Controlled Dangerous Substances (CDS) Registration Number M 15994, expired June 30, 1988. See State Exhibit I, a photostatic copy of Respondent's Maryland CDS registration, which is noted to have expired on June 30, 1988. In addition, counsel for Respondent stipulated to the accuracy of the Exhibits, and Respondent did not dispute the date of the expiration of the registration.

3. Respondent sold two (2) prescriptions to an undercover Baltimore County policeman, Sergeant Robin Dewberry, for a total price of $400, on September 8, 1988.

Sergeant Dewberry was working in an undercover capacity using the assumed name of Mike Wolfe when he purchased two (2) prescriptions from Respondent for a total of $400. Respondent, while seated in the passenger seat of his 1987 Pontiac Firebird bearing Maryland Registration TBX 0056 at 6461 Red Keel Road in Columbia, MD on September 8, 1988, wrote both prescriptions in the presence of Sergeant Dewberry. The prescriptions were for Dilaudid 4 mg, #100 each in the names of Mike Wolfe and Wayne Hazel (fictitious names) (State Exhibits A, C, and E).

4. On September 12, 1988, Respondent sold a prescription for Dilaudid 4 mg, #100 in the name of Bob Morgan dated September 13, 1988, and a prescription for Dilaudid 4 mg, #100 in the name of John Miller dated September 14, 1988, to Sergeant Dewberry for $200 each.

It was stipulated by counsel for Respondent, and not denied in the testimony of Respondent, that neither "Bob Morgan" nor "John Miller" was present when Respondent wrote these prescriptions (State Exhibits A, C, and E).

5. On September 14, 1988, Respondent sold a prescription for Dilaudid 4 mg, #100 in the name of John Wright (fictitious name) dated September 15, 1988, and a prescription for Dilaudid 4 mg, #100 in the name of Mike Wolfe (fictitious name) dated September 16, 1988, to Sergeant Dewberry for $200 each.

The names in which the prescriptions were written are fictitious. Although Sergeant Dewberry, who was undercover as Mike Wolfe, was present, he was not examined by Respondent, and Respondent did not take any history from him. Sergeant Dewberry (Mike Wolfe) did not seek medical care or treatment from Respondent when Respondent wrote the prescription, and he had never had a patient-physician relationship with Respondent (State Exhibits A, C, and E).

Respondent testified he was aware that the prescriptions were not medically indicated and that they were sought for illegal purposes.

6. On September 20, 1988, Respondent sold a prescription for Dilaudid 4 mg, #100 in the name of Larry Brown dated September 21, 1988, and a prescription for Dilaudid 4 mg, #100 in the name of Greg Welsh dated September 22, 1988 to Sergeant Dewberry for $200 each.

Respondent testified that the names "Larry Brown" and "Greg Welsh" were fictitious names and that he knew this when he wrote the prescriptions. He also testified that neither "Larry Brown" nor "Greg Welsh" were present when he wrote the prescriptions and that neither had a patient-physician relationship with him.

7. Respondent wrote the prescriptions mentioned in Findings of Fact numbers 3, 4, 5, and 6, supra, after his Maryland CDS Registration expired on June 30, 1988.

State Exhibit I, a photostatic copy of Respondent's controlled Dangerous Substances registration, No. M 15994, substantiates that Respondent's CDS registration expired on June 30, 1988. Counsel for Respondent stipulated to the accuracy of the Exhibit, and Respondent did not dispute it in his testimony. The above Findings of Fact, which have been substantiated by both stipulation from counsel for Respondent and the testimony of the Respondent, corroborate that Respondent wrote prescriptions for Dilaudid, a Schedule II controlled dangerous substance that may only be prescribed by a practitioner with a valid Maryland CDS Registration and a valid United States DEA Registration.

8. Respondent unlawfully prescribed controlled dangerous substances outside the course of his regular professional duties and not in conformance with the provisions of Article 27 Section 288(c), Subtitle Health-Controlled Dangerous Substances, *Annotated Code of Maryland*, and outside the standards of his particular profession relating to controlled dangerous substances.

Counsel for Respondent stipulated to the veracity of the allegations contained in the Charging Document, and Respondent, in his testimony, admitted to the fact that he unlawfully prescribed controlled dangerous substances outside the course of his regular professional duties and outside of the standards of his profession relating to controlled dangerous substances.

Respondent testified that he knew the prescriptions he wrote for Dilaudid (See Findings of Fact 3, 4, 5, and 6 supra) were issued outside of the scope of his professional responsibilities. Respondent stated that he knew, or should have known, that the persons requesting the prescriptions did not medically require the prescriptions he issued for controlled dangerous substances, and he knew that he was writing prescriptions for fictitious persons and/or persons with whom he had no patient-physician relationship.

Conclusions of Law

On the basis of the Findings of Fact, all of which are supported by clear and convincing evidence, the Board concludes that Respondent has violated:

1. Section 14-504(a)(2) of the Medical Practice Act, Title 14, Health Occupations Article, *Annotated Code*

of Maryland, by having fraudulently or deceptively used his medical license for the purpose of unlawfully prescribing controlled dangerous substances;

2. Section 14-504(a)(3) of the Medical Practice Act, Title 14, Health Occupations Article, *Annotated code of Maryland*, by having been guilty of immoral or unprofessional conduct in the practice of medicine; and

3. Section 14-504(a)(28) of the Medical Practice Act, Title 14, Health Occupations Article, *Annotated code of Maryland*, by having sold, prescribed, given away, or administered drugs for illegal or illegitimate medical purposes.

Order

Based upon the foregoing Findings of Fact and Conclusions of Law, pursuant to Health Occupations Article, Section 14-504, it is the 18th day of December 1989, by the Board of Physician Quality Assurance:

ORDERED that Respondent's medical license No. D 18844 be REVOKED; and be it further

ORDERED that this is a final order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

■ ■ ■

In the Matter of
Samuel R. Lewis MD
Before the
Maryland Board of
Physician Quality Assurance

Monday
August 14, 1989

HAND DELIVERED
Samuel R. Lewis MD
11102 Hudee Court
Mitcheleville, MD 20716

Re: Surrender of License
License Number D 06599
Case Number 89-00735

Dear Mr. Lewis:

Please be advised that the Board of Physician Quality Assurance (the "Board") has been advised that as part of your plea agreement in *State of Maryland v. Samuel Lewis MD*, circuit Court for Baltimore City, Criminal Number 28913017, on May 12, 1989, you agreed to surrender your license, see attachment of the docket entries, Order of Probation, Statement of Facts Under Health Occupations Article §14-508(a) unless the Board agrees to accept the surrender of a license, a licensed physician may not surrender the license while the licensee under investigation or charges are pending. Section §14-508(b) provides that the board may set conditions on its agreement with the physician under investigation or against whom charges are pending to accept surrender of the physician's license. The Board has discussed the surrender of your license and agrees to accept the surrender of your license under the following conditions.

The surrender of your license will be reported to the Federation of State Medical Boards, the Medical and Chirurgical Faculty, the Maryland Hospital Association, and other relevant agencies. You cannot give medical advice to any individual, for compensation or otherwise, and cannot prescribe medication. In other words, your surrender of your license means that you are in the same position as an unlicensed individual. This letter accepting your surrender of your license will be treated as a public document under the Public Information Act, State Government Article, Sections 10-611 through 10-630, *Annotated Code of Maryland*, and will be considered a final order by the Board.

The Board also conditions the acceptance of the surrender of your license on your surrendering:

1) All documents from the Federal Food and Drug Administration (FDA), the Federal Drug Enforcement Administration (DEA), the Maryland Division of Drug Control, or comparable Division in any other state or country which evidence or gives license to prescribe controlled dangerous substances.

2) All privileges at any hospitals where you had privileges;

3) All prescription pads bearing your name for destruction;

4) All medical licenses in other jurisdictions in which you have a license;

Further you must explain to the Board the arrangements you have made for transferring your patients to another physician. You should have explained to your patients that you are surrendering your license, giving the patients the name of the physician to whom you are turning over your practice. The patients should be given the option of continuing with this physician or selecting another. You must explain to your patients how they can arrange to have their medical records transferred if they so choose. You may wish to contact Michael A. Murray, Director of Operations, at the Medical and Chirurgical Faculty for guidance. The faculty has developed some letters you may find helpful.

Finally, in accepting the of surrender of your license to practice medicine, the Board will entertain a petition for reinstatement of your license in three (3) years. If you apply for reinstatement of your license you will bear the burden of proving to the Board not only that you complied with the terms of your court-ordered probations but also that you are of present good moral character and that you are presently competent to practice medicine. The Board will require that you take either the National Boards, the Flex Examinations, the SPEX examination or be evaluated by the McMasters program in Canada or a similar program.

You would bear the cost of any such examination or evaluation. In other words when you apply for reinstatement of your license you must demonstrate that you have the character and the cognitive and clinical competence to practice medicine in Maryland.

Under these conditions on behalf of the Board of Physician Quality Assurance, on this 3rd day of July 1989, I accept Samuel R. Lewis' surrender of license to practice medicine in Maryland, Number D 06599. As a result of this acceptance of the surrender of your license, no charges based on Case Number 28913017, referenced above, will be filed against you.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

In the Matter of
Angelita Topacio MD
Before the
Maryland Board of
Physician Quality Assurance

Consent Order

On August 30, 1989 the State Board of Physician Quality Assurance* (the Board) charged Angelita Topacio MD (the Respondent) with Violation of Conditions of the Final Order of April 10, 1984 issued by the Commission on Medical Discipline (the Commission). Specifically, the Board charged Respondent with violation of Condition 3 which states as follows:

> That Respondent practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland.

On October 4, 1989 a settlement conference was held.

As a result of negotiations entered into during the settlement conference, Respondent agreed to the following Consent Order.

Findings of Fact

1. At all times relevant to this Order, Respondent was and is currently licensed to practice medicine in Maryland.

2. On April 10, 1984 the Commission found that Respondent violated §14-504(6) of the Maryland Medical Practice Act, Md. Health Occ. Code Ann. (1981). The Commission ordered that Respondent's license to practice medicine in the State of Maryland be SUSPENDED: the suspension was immediately STAYED. Respondent was placed on probation subject to certain terms and conditions as set forth in the Findings of Fact, Conclusions of Law, and Order (the "Final Order") attached hereto and incorporated herein as Exhibit A.

3. Pursuant to the Final Order, Condition 3 required Respondent to practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland.

4. On or about July 1, 1984 the State of Maryland Department of Health and Mental Hygiene, Division of Drug Control (DDC) issued Respondent Controlled Dangerous Substances (CDS) Registration Number M13708, which expired June 30, 1985.

5. On December 3, 1984 the United States Department of Justice, Drug Enforcement Administration (DEA) issued Respondent Controlled Substances Registration Certificate Number AT919115, which expired November 30, 1985. Respondent has maintained her DEA Registration continuously since December 3, 1984. Respondent's current DEA Registration expires November 30, 1989.

6. On December 1, 1987 DDC issued Respondent a CDS Registration, which expired June 30, 1988. on July 1, 1988, DDC issued Respondent a CDS Registration which expires June 30, 1990.

7. On May 12, 1989, in the *State of Maryland; v. Angelita Topacio*, in the Circuit Court for Baltimore City, Respondent pleaded guilty to knowingly and willfully prescribing drugs in violation of the standards of her profession relating to controlled dangerous substances in violation of Article 27, §288(c) Annotated Code of Maryland arising from her failure to maintain a Maryland Controlled Dangerous Substances Registration as required by the Department of Health and Mental Hygiene.

8. On May 12, 1989, the Honorable Roger Brown found Respondent guilty of the offense described in paragraph 7 above and sentenced Respondent to one (1) year suspended sentence; three (3) years unsupervised probation; $5,000 fine; $115 court costs; and $763.78 restitution to the Medical Care Compliance Administration.

9. Respondent was practicing in violation of Condition 3 of the Final Order because Respondent failed to maintain a Maryland CDS Registration from July 1, 1985 to November 30, 1987.

Conclusions of Law

Based on the Findings of Fact, the Board, concludes as a matter of law that Respondent violated Condition 3 of the final Order and finds Respondent guilty of failing to practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland.

* The 1988 General Assembly, by Senate Bill No. 508 and House Bill No. 855, merged the functions of the former Commission on Medical Discipline and the former Board of Medical Examiners into the new Board of Physician Quality Assurance.

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 6th day of November 1989,

ORDERED that Angelita Topacio MD, a physician licensed to practice medicine in Maryland is hereby released from the probation imposed in the Final Order of April 10, 1984; and it is further

ORDERED that Angelita Topacio MD, is placed on PROBATION subject to the following terms and conditions:

1. That Respondent shall practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland;
2. That one (1) year from the date of this Order the Board will entertain a petition for termination of Respondent's probationary status if Respondent demonstrates to the satisfaction of the Board that she had complied with the terms and conditions of her probation;
3. The Board may order a peer review at any time during Respondent's probation. The Board may appoint a peer review committee to conduct the peer review or the Board may perform the peer review itself. The Board or peer review committee has complete discretion to select which office and hospital medical records it chooses to review. Respondent shall bear any administrative costs associated with the peer review. If the Board appoints a peer review committee, the committee shall prepare a report for the Board; and
4. If any complaints are received by the Board during the time Respondent is on probation, the Board may appoint a peer review committee to conduct a peer review of Respondent's practice as described in paragraph 3 above; and be it further

ORDERED that Respondent shall practice medicine and surgery in accordance with the Maryland Medical Practice Act, Md. Health Occ. Code Ann. §14-101 *et seq.* (1988 Cum. Supp.); and be it further

ORDERED that if Respondent violates any of the foregoing conditions of probation, the Board, after notification, a hearing, and determination of the violation by a preponderance of the evidence, may impose any disciplinary sanctions it deems appropriate.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby accept and agree to be bound by the foregoing Order and its conditions and restriction, consisting of eight pages.

1. By signing this Consent, I hereby submit to this Order and its conditions. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this consent, I waive all such rights.
2. I understand that if I fail to comply with the conditions enumerated above, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.
3. I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the Order.

ANGELITA TOPACIO MD

EXHIBIT A

In the Matter of
Angelita Topacio MD
Before the
Maryland Commission on
Medical Discipline

Findings of Fact, Conclusions of Law, and Order

Based on information coming to its attention, the Commission on Medical Discipline of Maryland (the Commission) conducted an investigation and subsequently determined to charge Angelita Topacio MD (Respondent) with violation of the Maryland Medical Practice Act, Health Occupations Article, Maryland Code Annotated, §14-504(6), as follows:

> Is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude....

Respondent was notified of the charges by letter dated December 27, 1983. A hearing was scheduled for May 1, 1984. On March 13, 1984, a prehearing conference was held. As a result of discussions and negotiations at the prehearing conference, Respondent agreed to enter into the following Consent Order.

Findings of Fact

Based on information in its files, and otherwise made known to it, the Commission finds:

1. That Respondent, Angelita Topacio MD, is a physician licensed and practicing in Maryland currently and at all times material to the allegations relating to the above matter.
2. That on February 4, 1982 Respondent pled guilty to counts of false pretenses, theft, and willful concealment and alteration of medical records in the Criminal Court of Baltimore City.
3. That the charges to which Respondent pled guilty were based upon her intentionally submitting to the Maryland Medical Assistance Program (Medicaid) false invoices for alleged consultation services rather than routine office visits, which latter services Respondent had provided to Medicaid recipients.
4. That said charges related to crimes of moral turpitude.
5. That on March 10, 1982 Respondent was granted probation before judgment by the Criminal Court of Baltimore City, and was fined $4,000, was placed on supervised probation for three years from the date of said disposition, was required to make restitution of $2,729 to Medicaid, and was required to perform 200 hours of community medical service without pay.
6. That Respondent presently is in compliance with the Scheduled performance of the Terms and conditions ordered by the Criminal Court of Baltimore City in the above matter.

Conclusion of Law

Based on the foregoing Findings of Fact, the Maryland Commission on Medical Discipline, by unanimous vote of those members considering the above case, concludes as a matter of law that Respondent violated §14-504(6) of the Maryland Medical Practice Act, Health Occupations Article, Maryland Code Annotated, and finds Respondent GUILTY of that charge.

Order

Based on the foregoing Findings of Fact and Conclusion of Law, it is this 10th day of April 1984, by unanimous vote of those members of the Maryland Commission on Medical Discipline considering the above case,

ORDERED that the license of Respondent, Angelita Topacio MD, an individual licensed to practice medicine in Maryland, is hereby SUSPENDED; and be it further

ORDERED that the suspension of Respondent's license shall be immediately STAYED and Respondent placed on PROBATION subject to the following terms and conditions:

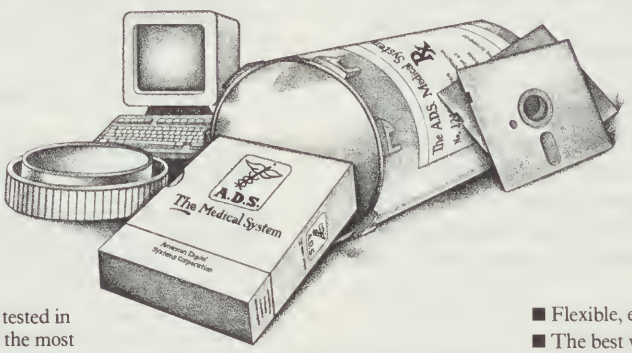
1. That Respondent shall not engage in activities of the type that led to her criminal conviction;

2. That Respondent fully perform and satisfy all terms and conditions of her probation as ordered by the Criminal Court of Baltimore City; and,

3. That Respondent practice fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland; and be it further

ORDERED that two (2) years from the date of this Order the Commission will entertain a petition for termination of Respondent's probationary status and for restoration of her license to practice medicine without condition or restriction, upon Respondent's demonstrating to the satisfaction of the Commission that she has complied with the terms and conditions of her probation. If the Commission determines that she has not complied with the terms and conditions of her probation, the Commission may modify one or more of the conditions of her probation; and be it further

ORDERED that if Respondent violates any of the foregoing conditions of probation, the Commission, after notification, a hearing, and determination of violation, may impose any disciplinary sanctions it deems appropriate.



HILARY O'HERLIHY MD, Chairman
Maryland Commission on Medical Discipline

Consent

By this Consent, I hereby admit the truth of the Findings of Fact and accept and submit to the foregoing Order and its conditions. I have read and acknowledge the validity of the Order as if made after a hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent I understand that I am waiving all such rights. I sign this Consent without reservation and after conferring with counsel and I fully understand its meaning.

ANGELITA TOPACIO MD ■

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Lupus Fellowships

The Lupus Foundation of America, Inc. announced recently that the Gina Finzi Memorial Student Summer Fellowships again will be offered to assist in promoting research related to systemic lupus erythematosus. Nationwide, ten stipends of $1,500 each will be provided to undergraduate, graduate, postdoctoral, medical, or doctoral students to conduct basic or clinical research under the supervision of an established investigator.

Locally, applications are available through the Maryland Lupus Foundation office located at 12 West 25th Street, Baltimore. Deadline for completed applications is April 1, 1990 with awards made in June 1990.

All applications will be reviewed NIH-type and ranked by members of the Lupus Foundation of America Medical Council Research Committee and independent reviewers representing areas of expertise relevant to the project.

Sergio Finzi PhD, former president of the Lupus Foundation, Inc., established the fellowship program ten years ago in memory of his daughter who died of lupus.

For more information on the Gina Finzi Memorial Student Summer Fellowship Program contact the Maryland Lupus Foundation, Inc. at 301-366-7272 or the Lupus Foundation of America, Inc. at 202-328-4550. ■

Med Chi Presents Awards to Governor Schaefer

Med Chi President-Elect Reynaldo Lee-Llacer MD; Executive Director, Angelo J. Troisi, FACHE; and Med Chi Lobbyist, Gerard E. Evans present the AMA Dr. Nathan Davis award and picture to Maryland Governor William Donald Schaefer.

Med Chi President-Elect Reynaldo Lee-Llacer MD, along with Med Chi Executive Director Angelo Troisi and Lobbyist Gerry Evans, officially presented the first American Medical Association Dr. Nathan Davis Award for Outstanding Public Service to Governor William Donald Schaefer during a ceremony at the Maryland Statehouse in January.

The award, an engraved Stuben glass bowl, was to have been presented to the Governor during an AMA awards ceremony in October 1989, but the final engravings were not complete. Rather than mail the award, Med Chi presented it to Governor Scaefer at an official ceremony along with a framed photograph. Beneath the photograph was the following inscription:

American Medical Association Honors William Donald Schaefer Governor as Most Outstanding Governor in United States in 1989

Governor William Donald Schaefer, nominated by the Medical and Chirurgical Faculty of Maryland, received the First Annual Dr. Nathan Davis Award for Outstanding Public Service in October 1989. The AMA initiated the Dr. Nathan Davis Award, named after the founder of the AMA, to recognize contributions by public servants promoting the art and science of medicine and the betterment of public health. It is appropriate that Governor Schaefer, Maryland's most preeminent public servant, receives this distinguished award because the concept of a Federation of State Medical Societies (the AMA) originated at the 1848 Annual Meeting of the Faculty. Med Chi nominated Governor Schaefer for this award because of his consistent actions as an outstanding advocate of Maryland citizens in promoting quality health care.

-Presented by the Medical & Chirurgical Faculty, January 1990.

Upon receipt of the AMA award, the Governor proclaimed, "The physicians in Maryland are the best physicians in the United States."

Governor Schaefer, the first gubernatorial recipient of the award, was honored among other notable public figures including former Surgeon General C. Everett Koop MD, California Representative Henry Waxman, and Former Senator Lowell Weicker from Connecticut.

More Awards

Following the presentation of the AMA award, Henry P. Laughlin MD made the Governor an honorary member of CAMPER (Catoctin Area Mountain Park Environmental Resource) and presented him with the organization's official belt buckle and a cap. Governor Schaefer is one of only two governors in the country to be honored with this membership. Dr. Laughlin is completing a third term as President of CAMPER, an organization with over 300 members that serves as the volunteer support group for the Catoctin Mountain Park, an important unit of the US Park Service since the 1930s and the site of Camp David. ■

Brothers Beyond Blood: A Battalion Surgeon in the South Pacific. George Sharpe MD. Austin, TX: Diamond Books, 1989, 274pp.

This is a recent, well-written, and vivid autobiographical account of the World War II experiences of a US Army battalion surgeon, who served admirably from 1942 to 1946. It will interest most of our fellow physicians as well as all combat veterans of our recent conflicts, their families, and all who care about history. The author's invaluable account is especially gripping and poignant for those of us who survived our own wartime experiences in the South Pacific theatre of operations.

Dr. Sharpe begins with brief references to his early stateside duties and later occasionally ties these in with his subsequent experiences to illustrate how they provided some preparation or lack thereof. The careful preservation of daily letters from overseas to his wife Alison provided ample detailed data to thoroughly mobilize his recollections and to ensure an accurate chronology of events. At various intervals in his account examples of letters are quoted in full or even in sequence, exactly as written.

Following assignment to the 608th Clearing Company and embarkation on March 22, 1944 from Camp Stoneman and San Francisco on *The Hawaiian Shipper*, unescorted for a four-week voyage into the western Pacific, Dr. Sharpe arrived at Milne Bay, New Guinea. His friend from medical school days, Jerry Soloman, was a close companion then and later, until his tragic death in September from *tsutsugamushi* fever (Japanese scrub typhus: a rodent-carried, mite-bite transmitted rickettsial illness then with up to 10 percent or higher mortality). Both had endured bouts with dengue (breakbone fever: a mosquito borne, viral, debilitating disease, with ordinarily near zero mortality), and the author also suffered for nearly two years from occasional recurrent but long-undiagnosed malarial episodes.

Disease, injuries, and combat casualties as well as personal relationships in several combat areas in New Guinea are carefully described. Enemy behavior receives intermittent comment throughout, and Sharpe includes intriguing observations about the indigenous peoples both there and later on in Luzon, Philippine Islands. One secures a keener appreciation of the continuing problems occasioned by separation from the spouse and family. Interspersed are useful and timely references to concurrent global ware events.

The author's wartime experiences in New Guinea ended December 29, 1944 upon embarkation to join the Lingayen Gulf, Philippine Islands invasion force, serving as surgeon of the 2nd Battalion, 20th Infantry Division. Landing on January 9, 1945 was followed by nearly continuous combat in Luzon until word of the Japanese surrender was received on August 10, 1945; one stretch of 112 days set the record for the Pacific Theatre. This account is remarkably candid in its description of the assets and foibles of many individual coparticipants. Dr. Sharpe calls them as he sees them. He is commendably confiding about his own feelings, which as would be expected, run the gamut of emotional experience. Wounds, injuries, illness, and death including another close friend in battle provide a myriad of medical and personal events, all of which have impact. As hostilities wind down, the point system devised for return to the states and/or discharge was of no benefit to the author or to those of us in other branches of service who similarly held regular commissions.

As a powerful and factual account of wartime medical adventures, it is a pleasure to highly recommend our Kensington colleague, Dr. Sharpe's excellent narrative to our other Maryland physicians, as well to anyone who has an interest in this significant area of our recent history. As the reader will discern, Dr. Sharp's attitude toward his fellow man enters into his careful choice of a title.

Topics in Clinical Medicine. Fee: $650 physicians, $450 residents/PAs, and nurse practitioners; 40 AMA Cat I credits. Info: C. Kearney 301-955-2959.

June 4-15

Third Summer Institute in Environmental Health Studies. Subjects include Risk Assessment & Risk Management, Toxicology, Physiology, Occupational Health, Industrial Hygiene, Radiation Health Science, and Risk Communication. Academic or CEU credit. Info: J. Corn 301-955-2609.

June 20-23

Second Baltimore Perinatal Colloquium, sponsored by the Department of Gynecology and Obstetrics, Divisions of Maternal-Fetal Medicine, The Johns Hopkins University School of Medicine and The University of Maryland School of Medicine. Fee: physicians $450, residents $250 (with letter from department chairperson verifying status); 24 AMA cat I credits, ACOG cognates available. Info: 301-955-2959.

Continuously Throughout the Year

Ophthalmic Electrophysiology Technician Training Course (on-going 1-week course by appointment). The Wilmer Eye Institute, Baltimore. Info: C. Kearney.

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $500; 40 AMA Cat I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussion for clinicians; 30 topics/year in 5 bimonthly programs. Individual and group subscriptions; 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169. ■

PHYSICIANS

Family Practice or Emergency

Family Practice or Emergency Physicians for fast-track area of busy hospital Emergency Department. Part-Time/Full-Time positions available.

Please contact:

Anne Salmon Barone, Ph.D., M.D.
St. Agnes Hospital
900 S. Caton Avenue
Baltimore, MD 21229
(301) 368–2000 or
(301) 368–2012

EMERGENCY PHYSICIANS

Well established, successful, independent fee-for-service group based in a modern suburban community hospital seeks career-oriented emergency physicians. Excellent compensation. Health, vacation, CME benefits and bonus incentives. Flexible schedule and rapid advancement. Long term relationship desired. Close to Annapolis and ocean communities. Board prepared in EM or related field. Available immediately.

Please contact and send CV to:

Walter L. Scheetz, MD, Director
Emergency Medicine Department
North Arundel Hospital
301 Hospital Drive
Glen Burnie, MD 21061
(301) 787-4571/4572

For the Physician Desiring to Practice Creative Medicine:

Kaye's AID Pharmacy

PROFESSIONAL COMPOUNDING CENTER OF BALTIMORE

Our Pharmacists compound medications that are not commercially available.

David B. Liebman, R.Ph., Compounding Pharmacist
6913 Belair Road, Baltimore, MD 21206
Mon - Fri 9-9, Sat 9-8 • (301) 665-5192

We mail anywhere in the U.S.A. within 48 hours.

INTERNIST

Internist wanted to join growing multi-specialty primary care practice in Baltimore area. Available July 1, 1990. Opportunity to develop specialty practice component available. Board certified or eligible.

For more information, send letter and curriculum vitae to:

Medical Group for Primary Care, P.A.
3421 Benson Avenue, Suite 200
Baltimore, Md. 21227

The Front Lines of OB.

Not for the faint-hearted. But for those who want to make a difference. **Sunlife** has a bold, aggressive program–caring for uninsured and unassigned patients at **PRINCE GEORGE'S HOSPITAL CENTER** in Cheverly, MD: Just minutes from cultural center of Washington, D.C. Excellent compensation, professional liability insurance, attractive on-call schedules and new, modern OB/Peds wing.

Immediate openings for BC/BE OB/GYN physicians.

Join the Sunlife team.
Call Cynthia Swanson for details

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

Call the Medical Solutions Management representative at (301) 539-0872 or toll-free in Maryland at 1-800-492-1056.

Over 70% Leased

CRAIN TOWERS

- 84,000 sq. ft. 6-story executive professional office towers
- 1,000 to 13,000 sq. ft. available for lease.
- 4.3-acre site.
- Occupancy scheduled for November, 1989
- Professionally managed by Casey-Carey Winston, Inc.
- Three exterior glass elevator columnns.
- 3-story marble atrium lobby.
- Individually-controlled state-of-the-art design for personal compfort.
- Direct access to I-295, I-695, Route 3 and the new I-97.
- High visibility from Routes 100 and Business Route 3.
- Generous construction allowances
- Close proximity to North Arundel Hospital, BWI Airport, Marley Station Mall, Westinghouse, NSA, and Ft. Meade.
- On-site medical services including full service lab, radiology services, CAT Scan, and radiation therapy.
- Convenient parking for tenants and clients, with 359 parking spaces and an attractive sheltered marquise entryway.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Frank J. Mayo, M.D., Pulmonologist

Sentient Systems offers total solutions. Hardware (IBM® and compatible), software, installation, data conversion, training, support and service are a part of every system. We provide the highest quality medical system available today. Just ask our customers.

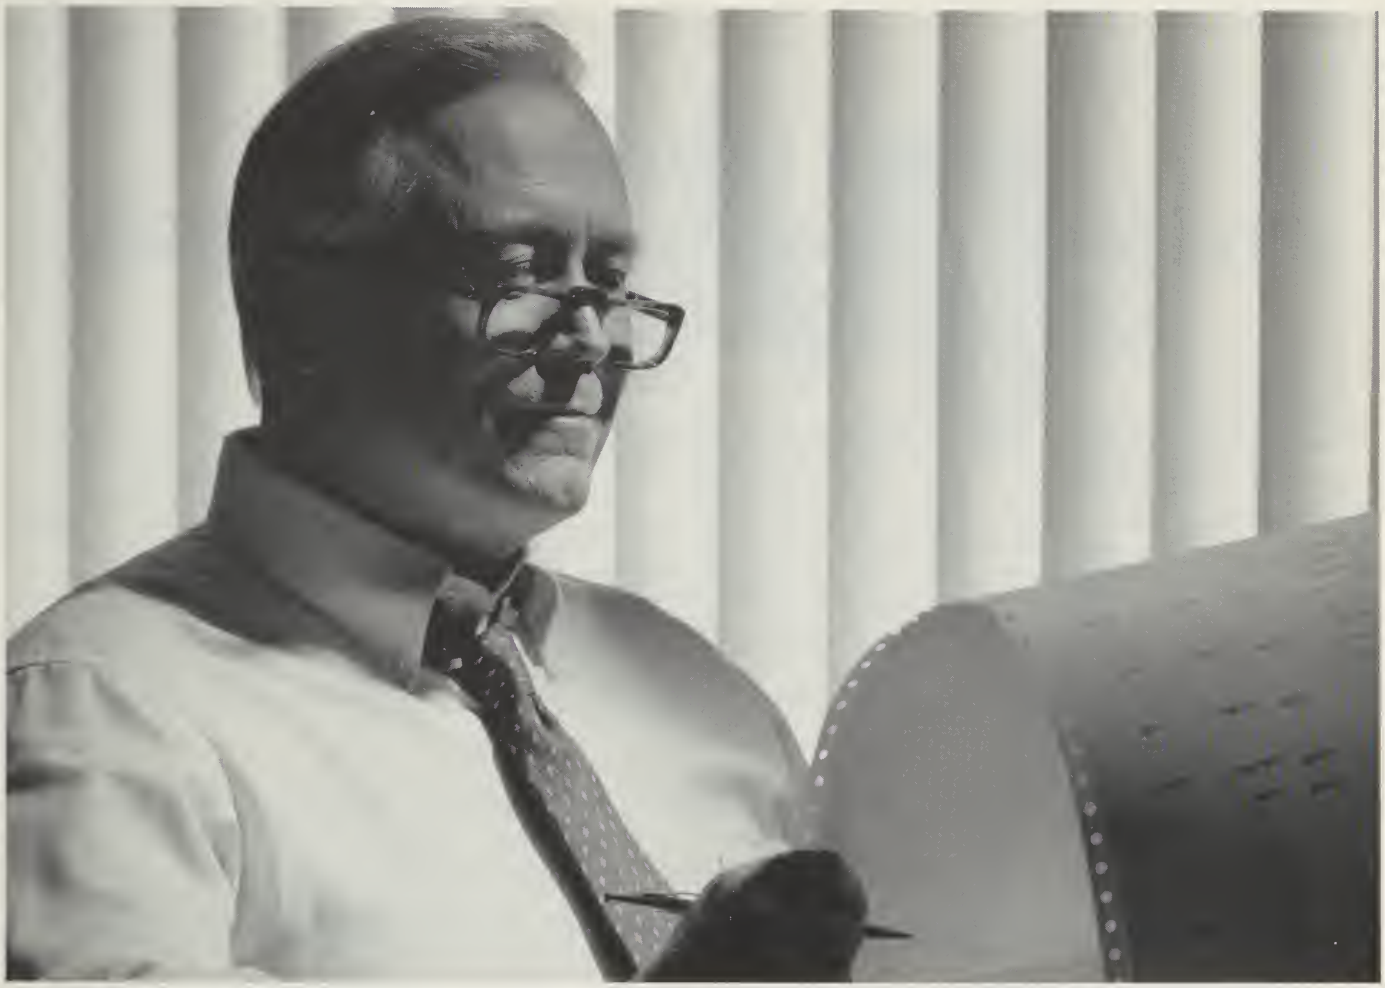
Maryland Physicians: Thanks To You, It Works.

The history of Medical Mutual is really the story of physicians working together to surmount complex problems which had defeated others. Through cooperation, persistence and the strength to make difficult decisions, the physicians of Maryland have set an example for the rest of the country.

It all began, of course, in 1975 when the major medical malpractice insurers announced they were leaving Maryland. Spiraling malpractice awards and the prospect of large-scale losses, the companies said, made it impossible to do business in Maryland. As the potential threat to public health became evident, many people feared that health care delivery in the State was on the verge of collapse.

With no relief in sight, physicians, citizens, and the General Assembly worked together to create what had never before existed anywhere — a medical professional liability insurance company owned and directed by its physician members. On June 3, 1975, Medical Mutual was created.



Over the past 15 years, other companies have come, and gone, and come again — entering Maryland when there were profits to be carried away, and leaving whenever times got tough. Through it all, Medical Mutual's physicians have proved that their long-term commitment was the right choice.

For 15 years, our thousands of physician members have been at the heart of what we are, and we are unique because of your needs, your insight, and your guidance.

The success we have earned was by no means universally predicted in 1975. But we survived those difficult first years, and now, 15 years later, we are proof of what physicians can do when they work together for a common goal.

Thanks to you, it works.

SENTIENT
SYSTEMS

THE MEDICAL COMPUTING LEADER

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, just call or send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

Send or call for your FREE report

ARTICLES

Reynaldo L. Lee-Llacer MD, 1990-1991 Med Chi President 453
Betsy Newman, Public Relations Director, Med Chi
One of the most important issues for physicians today is the future of medicine in the United States.

Estimates of Public Costs for Teenage Childbearing in Baltimore City in FY 1987 459
John Santelli MD, MPH; Lisa Rosenblatt MHS; and Anne Emanuelle Birn MA
In 1987 Baltimore City spent about $179,500,000 on AFDC, Medicaid, and food stamps for families that were begun when the mother was a teenager. Had all these births been delayed until the mother was at least 20 years old, Baltimore would have saved almost $72,000,000 in public outlays.

Focus Review: An Old Concept Revisited 465
Ira R. Horowitz MD
Medical students throughout the world learn clinical skills in a physical diagnosis course. Clinicians can use this approach to design a "focus review" to serve as a method of evaluation in the quality assurance of healthcare and as a research tool.

Case Report: Gamma-Globulin Treatment of Severe Varicella-Associated Thrombocytopenia 469
Harvey J. Steinfeld MD
Treatment of varicella-associated thrombocytopenic purpura has included platelet transfusions, prednisone, and more recently intravenous gamma globulin, whose efficacy in this condition is not widely appreciated.

Case Report: Radiologic Diagnosis of Intracranial and Intraspinal Subarachnoid Metastasis from a Malignant Spinal Cord Astrocytoma 471
Timothy J. Miller MD and Henry Wang MD
Both CT and MRI demonstrate well the aggressive nature of malignant astrocytoma of the spinal cord, a rare and highly lethal cancer.

Case Report and Review of Literature: Hypernatremia in Breast-Fed Infants 475
Fred J. Heldrich MD and Sandy Sunghee Shaw MD
Hypernatremic dehydration in breast-fed infants is preventable, requiring adequate instruction of mothers prior to hospital discharge and close follow-up after leaving the hospital.

Information for Authors

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request, *MMJ* will return your disk after your article is published or if the manuscript is not accepted.

Include full name of author(s) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double spaced and numbered consecutively as they appear in text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal jEditors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

* * *

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Cover photo by Michelle Dunn.

THERAPY THAT MAY BE AS SILENT AS HYPERTENSION ITSELF

VASOTEC is generally well tolerated and not characterized by certain undesirable effects associated with selected agents in other antihypertensive classes.

VASOTEC is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

A diminished antihypertensive effect toward the end of the dosing interval can occur in some patients.

For a Brief Summary of Prescribing Information, please see the last page of this advertisement.

FOR MANY HYPERTENSIVE PATIENTS
ONCE-A-DAY

VASOTEC®
(ENALAPRIL MALEATE | MSD)

Copyright © 1990 by Merck & Co., Inc.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Patients with heart failure given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in patients with heart failure), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASDTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASDTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (>5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for disconfinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness, especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Pregnancy – Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use of ACE inhibitors has not been clearly defined, VASDTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal outcome adversely. Fetal exposure during the second and third trimesters of pregnancy has been associated with fetal and neonatal morbidity and mortality.

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion with the administration of fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSION: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASDTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema, rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis (hepatocellular or cholestatic jaundice), melena, anorexia, dyspepsia, constipation, glossitis, stomatitis, dry mouth.

Musculoskeletal: Muscle cramps.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and OOSAGE AND ADMINISTRATION).

Respiratory: Bronchospasm, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection.

Skin: Exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, pruritus, alopecia, flushing, hyperhidrosis.

Special Senses: Blurred vision, taste alteration, anosmia, finnitus, conjunctivitis, dry eyes, tearing.

A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgias/arthritis, myalgias, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash, and other dermatologic manifestations.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASDTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g% and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of ahemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported. A few cases of hemolysis have been reported in patients with G6PD deficiency.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

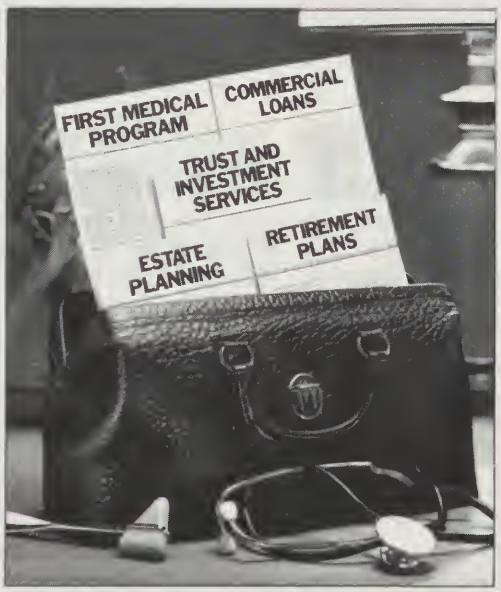
Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance > 30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤ 30 mL/min (serum creatinine ≥ 3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.



Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starfing dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIDNS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent carefut dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Patients with Heart Failure and Renal Impairment or Hyponatremia: In patients with heart failure who have hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure,* WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

MSD
MERCK SHARP & DOHME

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 581-1212. When it comes to curing practice management problems, we are the specialists.

CADO SYSTEMS — WE OFFER PRACTICE MANAGEMENT SOLUTIONS, NOT JUST COMPUTERS!

Chronic Fatigue Syndrome
May 1990

The information presented below is from "The Chronic Fatigue Syndrome: An Information Pamphlet produced by the Centers for Disease Control, January 1990"

Summary

Various studies of chronic fatigability have identified groups of patients with the following characteristics: persistent or relapsing illness lasting at least 6 months, characterized primarily by extreme fatigue and associated with other nonspecific symptoms, with no other detectable disease that would be likely to cause the symptoms. There is little convincing serologic evidence, so far, that these study patients' symptoms are caused by EBV or by any other known virus. CFS may in some cases be found to be associated with an immune system defect, and there is evidence to suggest that some pre-existing psychological tendencies may predispose persons to develop CFS or CFS-like symptoms. A reasonable hypothesis is that psychological factors, an inherent or acquired immunologic abnormality, and/or any of several infectious or other environmental stimuli may combine in various forms to cause CFS.

Introduction

The Chronic Fatigue Syndrome (CFS) is a recently defined illness that is characterized by debilitating fatigue and a group of related symptoms, including headache, sore throat, fever, weakness, lymph note pain, muscle and joint pains, memory loss, and difficulty concentrating. By definition the illness lasts at least six months and often lasts for years. It is currently a provisional diagnosis, to be considered by the physician only after all other potential causes of illness have been reasonably excluded. A working case definition of the illness was developed by the Centers for Disease Control (CDC), along with more than a dozen experts in the field, and published in 1988 [16] [See Box, below].

Onset, Symptoms and Transmissibility

In some persons, the symptoms of CFS follow an illness resembling influenza or other nonspecific acute viral diseases. For others, CFS seems to follow infectious mononucleosis or acute cytomegalovirus (CMV) infections. In many people CFS develops gradually, with no detectable cause.

CFS is not a progressive disease. For most people, symptoms plateau early in the course of illness and recur with varying degrees of severity for at least six months. Death resulting from CFS has not been reported. There is no convincing evidence that the illness can be transmitted from person to person, and there is no apparent justification for CFS sufferers to be isolated from other persons.

Despite the unfortunate name, "yuppie flu," given to it by the media, it is not at all limited to this group. CFS is diagnosed in people from all walks of life, ranging in age from children to adults in their 50s and 60s; however, most of the patients who have sought medical care are Caucasian women aged 30-50 years.

Prevalence

It is not known how many people have CFS because it cannot be diagnosed with certainty. Estimates of CFS prevalence have been as high as 5% of persons attending a university fatigue clinic[22], and 21% of 500 unselected patients in a university general medical clinic[5]. Both of these studies used highly selected populations, and neither provides a good estimate of the frequency of CFS in the general population. The researchers in the second study acknowledged that the forty patients in this study group may not have been as ill as some participants in other studies; and many may not have fulfilled published criteria for CFS. In an effort to get better estimates of CFS frequency, in October, 1989 the CDC initiated a CFS Surveillance and Follow-up System in four sites across the U.S.

History of CFS

For more than a century, there have been reports in the scientific literature of syndromes of chronic fatigue associated with a variety of other symptoms, including low-grade fever, sore throat, lymph node enlargement, headache, muscle aches, joint pains, and feelings of depression. Over the years, medical and other health practitioners have developed a variety of explanations which include anemia, hypoglycemia, environmental allergy, or candidiasis. Several investigators have described a chronic debilitating illness following acute infectious mononucleosis[3,7,18,25]. An illness, variably called benign myalgic encephalomyelitis (ME), epidemic neuromyasthenia, or Icelandic disease, has been described repeatedly during the past fifty years. This illness is very much like CFS except that it has usually been described as occurring in epidemics[1,13]. A chronic debilitating condition following apparent infection with any of several different infectious agents has also been described[27]. The illness called either fibrositis or fibromyalgia is also similar to CFS (they may

represent the same illness)[12]. The etiology of these syndromes of chronic fatigue has remained unknown in spite of intensive search.

Possible Causes

Epstein-Barr Viral Infections

Several recent studies have attempted to link CFS to the Epstein-Barr virus (EBV)[10,19,28,30]. EBV is one of the family of herpesviruses, and EBV infection is almost inevitable in human beings. In the United States, 80-95% or adults have EBV antibodies by age 35 to 40. In developing countries, most humans acquire the virus during childhood[9]. In children, acute EBV infection usually causes no symptoms or is indistinguishable from the other mild, brief illnesses of childhood[4,11]. In the United States, infection with EBV tends to be acquired during adolescence or young adulthood and the classic manifestation of the virus is infectious mononucleosis. Between 30 and 45% of individuals in these age groups who are newly infected with EBV in the U.S. develop mononucleosis[2,26]. Although the symptoms of mononucleosis usually resolve within one or two months, EBV chronically infects cells in the throat for the rest of the person's life. It can periodically reactivate and be shed in the saliva of infected persons without producing symptoms, and it is therefore almost impossible to prevent transmission of the virus[23]. EBV also establishes a lifelong latent infection of a small fraction of B lymphocytes[31], and may cause two malignant diseases, Burkitt's lymphoma and nasopharyngeal carcinoma.

At least two studies have reported that persons with CFS or CFS-like illnesses are no more likely than healthy controls to have EBV antibodies[5,15]. Furthermore, although in one study these patients, as a group, had slightly higher EBV titers than controls, the two groups overlapped and the "elevated titers" were of no value in determining the diagnosis or in assessing the status of illness in individual patients. This testing also found similar, slightly higher titers against several other viruses in the patient group, further decreasing the likelihood that EBV was the cause of their illnesses[15].

It remains possible that reactivation of the EBV could be a factor in the onset of a symptom complex such as CFS in some persons, and some researchers continue to pursue this possibility. However, elevated titers of EBV antibodies are frequently found in healthy persons and in persons with a variety of other diseases, and some CFS patients lack EBV antibodies. Thus, there is no consistent link between elevated EBV antibody titers and the presence of CFS, and measurement of the titers is not of use in diagnosing or treating the illness. Most investigators now believe it is unlikely that EBV is the causal agent in most cases of CFS.

Other Viruses

Other viruses have been associated with CFS in some studies, although none appears to be the specific cause. Holmes[15] reported that antibodies against other human herpesviruses (CMV, and Herpes simplex virus types 1 and 2) and measles virus were higher in patients with CFS-like illnesses than in healthy controls. Also, several recently published research abstracts suggest that antibody levels to the newly discovered human herpesvirus-6 (HHV-6) are higher in patients with CFS than in control subjects. A recent study[8] reported that 69% of CFS patients, 86% of persons with miscellaneous other disorders and 12.5% of controls had antibodies against this virus, suggesting that persons with a variety of illnesses may have secondarily increased HHV-6 titers. These higher levels are not specific indicators of viral activity, and may simply represent nonspecific immune responses to a variety of stimuli. Although it is possible that HHV-6 may play a role in CFS, this cannot be proven using current antibody tests.

Immunologic Abnormalities

Several subtle immunologic abnormalities have been described in some patients with CFS. Low levels of specific gamma globulins have been reported in 17 to 71% of some groups of CFS patients in some studies[10,28] but in less than 15% of patients in a later study[29]. Circulating immune complexes have been described in 30% to over 50% of patients[28,29]. Also, increased ratios of CD4/CD8 (or "helper"/"suppressor") T-lymphocytes have been reported[10]. In a study of natural killer cells in 41 patients with CFS[6], many CFS patients had relatively low numbers of NKH1 + T3- lymphocytes, a population that represents the majority of NK cells in normal individuals. Most of the CFS patients had NK counts that were within the normal range, although the CFS group as a whole has lower counts than the control group. Also, their NK cells often had impaired function. The significance of these defects is uncertain.

These and other immunologic findings must be regarded as preliminary, but the data suggest the possibility that modest immunologic dysfunction may occur in a small portion of CFS patients. Because such abnormalities have been reported, some physicians and support groups prefer to call the illness chronic fatigue and immune dysfunction syndrome (CFIDS). Most experts continue to prefer CFS, because most patients do not have these immunologic abnormalities.

Psychological Aspects of CFS

There is a great deal of controversy regarding the role of psychological factors and psychiatric diseases in causing CFS. Many of the physical symptoms of CFS--headache, muscle aches, difficulty in concentrating and sleep disorder--are also characteristic of primary mood disorders. However, other symptoms--sore throat, fever, lymph node enlargement, and joint pains--suggest an underlying physical illness. Some of the patients state that CFS began at points in their lives when they were under great psychological stress, suggesting that this may play a role in the illness. The majority of CFS patients describe themselves as depressed or anxious, but many say that the depression and anxiety developed after the onset of CFS and is a secondary reaction to CFS. A number of current studies are attempting to assess the importance of these factors in CFS.

Diagnosis

It is very important for the patient with CFS symptoms to be fully evaluated for other chronic diseases. Chronic fatigue, as an isolated symptom is common in the general population, and CFS appears to be present in only a small fraction of persons who complain of chronic fatigue[21]. In fact, many practitioners believe that the typical patient

seeking medical care for a complaint of chronic fatigue is suffering from a primary psychiatric disorder[22]. Many other well-recognized organic illnesses can also produce chronic fatigue, and such illnesses must be considered in the differential diagnosis of CFS. These illnesses are summarized in the CDC working case definition for CFS[16] [see Box]. Most of these diseases can be treated or managed appropriately following diagnosis and some may be progressive or even fatal if untreated, justifying the cost in time and money of a full medical evaluation. It is also advisable to periodically repeat such evaluations. Many instances have been reported in which patients diagnosed with CFS have later been found to have a specific disease, such as a connective tissue disorder, malignancy, or other chronic illness, that was likely to have been the cause of the CFS symptoms from the beginning.

Treatment

No proven effective treatment for CFS now exists. There are some anecdotally reported successes in small numbers of patients with a wide range of treatments, including antiviral and immunomodulating drugs, vitamins, holistic remedies, diet modifications, and activity reduction. However, such anecdotal reports may often reflect placebo effects or the natural course of the illness, not true therapeutic effects of treatment. Only one agent, acyclovir, has undergone rigorous clinical testing, and was found to be no more effective than a placebo[29].

Most experts recommend a regimen of balanced diet, adequate rest, and moderate physical conditioning. Some researchers have suggested that low doses of antidepressant drugs such as doxepin, taken at bedtime, have improved many patients' symptoms. All treatments have potential side effects, and in many instances, the risk of side effects outweighs the potential benefits of treatment[32]. In addition, many experimental treatments are often expensive. Before consenting to treatment with an experimental or unproven medication, the patient should discuss in detail the known potential benefits and risks of the treatment and,

Case Definition for The Chronic Fatigue Syndrome

(Holmes GP, Kaplan JE, Gantz NM, et al. Ann Int Med. 1988;108:387)

A case of CFS must fulfill **major criteria 1 and 2,** and the following **minor criteria: 6 or more of the 11 symptom criteria and 2 or more of the 3 physical criteria; or 8 or ore of the 11 symptom criteria.**

Major criteria

1. New onset of persistent or relapsing, debilitating fatigue in a person who has no previous history of similar symptoms, that does not resolve with bedrest, and that is severe enough to reduce or impair average daily activity below 50% of the patient's premorbid activity level for a period of at least 6 months.
2. Other clinical conditions that may produce similar symptoms must be excluded by thorough evaluation, based on history, physical examination, and appropriate laboratory findings. These conditions include malignancy; autoimmune disease; localized infection; chronic or subacute bacterial disease, fungal disease, and parasitic disease; disease related to human immunodeficiency virus infection; chronic psychiatric disease; chronic inflammatory disease, neuromuscular disease; endocrine disease; drug dependency or abuse; side effects of a chronic medication or other toxic agent; or other known or defined chronic pulmonary, cardiac, gastrointestinal, hepatic, renal, or hematologic disease.

Appropriate studies for evaluating patients include: Complete blood count with differential cell count; Serum creatinine, electrolytes, glucose, total protein, albumin, calcium, and phosphorus levels; total bilirubin, ALT, AST, and alkaline phosphatase levels, creatine kinase level; ESR; urinalysis; TSH level; ANA, RF titers, HIV serology; EBV capsid antigen IgM serology; CMV IgM serology; HBsAg, HAV IgM antibodies; toxoplasmosis serology; serum immunoglobulin levels; Lyme serology; RPR-CT or VDRL for syphilis; Chest radiograph, PPD. If any of these tests are abnormal, the physician should search for other conditions that may cause such a result.

Minor Criteria

Symptom criteria

To fulfill a symptom criterion, a symptom must have begun at or after the time of onset of increased fatigability, and must have persisted or recurred over a period of at least 6 months. Symptoms include:

1. Mild fever--oral temperature between 37.5 C and 38.6 C if measured by the patient--or chills.
2. Sore throat
3. Painful lymph nodes in the anterior or posterior cervical or axillary distribution
4. Unexplained generalized muscle weakness
5. Muscle discomfort or myalgia
6. Prolonged generalized fatigue after levels of exercise that would have been easily tolerated in the patient's premorbid state
7. Generalized headaches
8. Migratory arthralgia without joint swelling or redness
9. Neuropsychological complaints (one or more of the following: photophobia, transient visual scotomata, forgetfulness, excessive irritability, confusion, difficulty thinking, inability to concentrate, depression)
10. Sleep disturbance
11. Description of the main symptom complex as initially developing over a few hours to a few days

Physical Criteria

Physical criteria must be documented by a physician on at least two occasions, at least 1 month apart.

1. Low grade fever--oral temperature between 37.6 C and 38.6 C
2. Nonexudative pharyngitis
3. Palpable or tender anterior or posterior cervical or axillary lymph nodes.

if there is any question, obtain a second opinion from another reputable physician.

Recommendation

The current recommendation for persons contacting the CDC who believe they may have CFS is to consult carefully with their physicians to make certain that other conditions have been thoroughly ruled out. Periodic rechecks for other diseases are important, because some of these may be quite difficult to detect and yet may be treatable. Currently available EBV antibody tests are of no value in diagnosing the syndrome. More specific laboratory tests are being sought that will enable better differentiation of ill patients from otherwise asymptomatic persons, but for now the diagnosis is based upon symptoms, physical findings.

Information available to date indicates that patients with this syndrome, whatever its cause, tend to suffer relapses after over-exerting themselves. Therefore, the best recommendation is to get plenty of rest, exercise only as much as can be tolerated, and obtain good balanced nutrition. Treatment, if necessary, should be obtained through a reputable physician. A number of proposed treatments are of no value, and some may actually be harmful. In persons who have significant depressive symptoms, low doses of antidepressants may be indicated. A variety of antidepressant agents are available, and each has its own range of side-effects. If one agent fails to be tolerated, another may be tried.

The CDC does not recommend specific physicians, but generally recommends consultation with an infectious disease specialist, or the infectious disease department at a university-affiliated medical center, or to ask your county medical society for a referral.

COMMITTED TO EXCELLENCE

ROCHE

PRESIDENT'S ACHIEVEMENT AWARD

Presenting the winners of the 1989 Roche President's Achievement Awards

Roche Laboratories is proud to honor these outstanding sales representatives, chosen for their unparalleled dedication to the healthcare field, professionalism and consistent high level of performance. Please join us in congratulating these exceptional individuals.

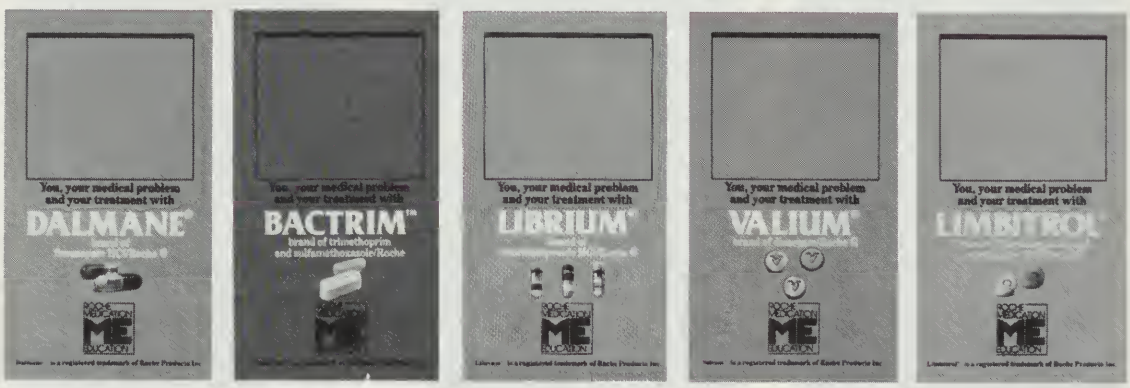
John B. Bailey

Wendy Rucci

Henry C. Shimonkevitz

Turn to the following page and find out how your award-winning Roche representative can help both you *and* your patients.

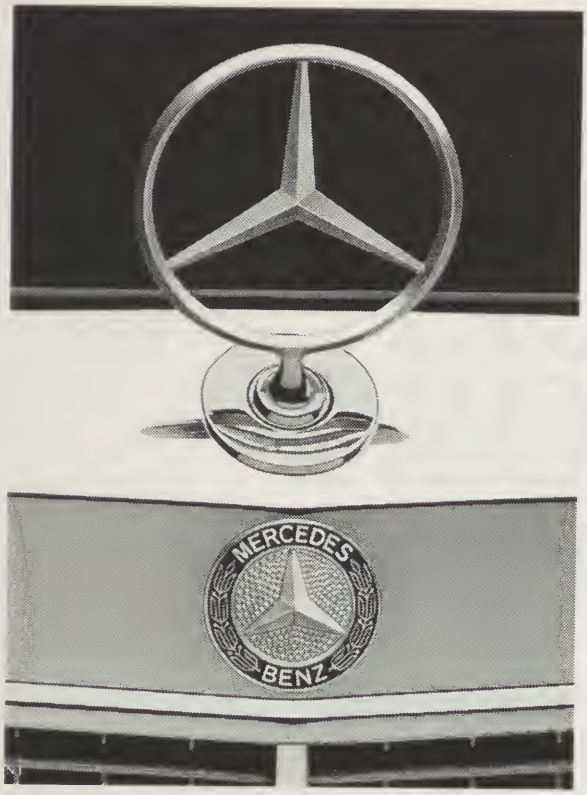
Your Roche Representative Would Like You To Have Something That Will...



ROCHE®

... improve patient satisfaction with office visits.
... improve patient compliance with your instructions.
... reduce follow-up calls to clarify instructions.

Roche product booklets ...



- offer a supplement to, not a substitute for, patient contact.
- support your specific instructions to the patient.
- provide a long-term reinforcement of your oral counseling.
- are available in *Spanish*.

Because you are the primary source of medical information for your patients, we invite you to look over the Roche product booklets shown below. Ask your Roche representative for the new catalog brochure of patient education materials and for a complimentary supply of those booklets applicable to your practice, including the WHAT IF Book in large type.

MARYLAND CENTER FOR THE TREATMENT OF IMPOTENCE

featuring the ErecAid System

The ErecAid System is a simple, safe and effective treatment for impotence without the risks and expense of surgery or drugs. It is useful for the treatment of impotence due to the following:

- Diabetes
- Hypertension
- Spinal Cord Injury
- Implant Protheses Reversal
- Medication Reaction
- Prostate Surgery
- Vascular Disease
- Multiple Schlerosis
- Psychogenic Factors

For the treatment of impotence

The longer you look, the more we stand out.

Our commitment to provide local support and service for the nation's leading medical office computer system, THE MEDICAL MANAGER®, has made us the region's leading reseller for the last three years.

Our approach to client service is based on:

- THE MEDICAL MANAGER®, the most popular medical office computer system, with more than 7,000 installations nationwide.
- A network of three local offices staffed with experienced medical office management people and our own computer technicians.
- A system which includes any, or all, of the following:
  - ◇ Medical Billing
  - ◇ Clinical History
  - ◇ Electronic Claims
  - ◇ Scheduling & Recalls
  - ◇ Word Processing
  - ◇ Accounting

Interested? Call us for a list of references. Our clients can tell you about superior support and system performance.

Executive Director's Newsletter

May 1990

Legislative Update

Med Chi physicians significantly helped its lobbying efforts this year. Your endeavors to maintain high standards of care for Maryland citizens have contributed to many of this year's legislative victories:

Mandated Medicare Assignment Defeated for Fourth Consecutive Year House Bill 617, which would have required physicians to accept Medicare Assignment based on income levels, was defeated in Committee by a vote of 17 to 6. Med Chi thanks all those physicians who helped to defeat this legislation.

HSCRC Regulation of Fees Defeated The Health Services Cost Review Commission's bill that would have regulated the activities of anesthesiologists, radiologists, and pathologists was defeated in committee on March 9, 1990 by a vote of 21 to 0.

HSCRC Utilization Control Mechanisms Defeated House Bill 1195, which would have allowed the Health Services Cost Review Commission to conduct studies on the utilization and cost of nonhospital healthcare services and to recommend utilization control mechanisms for these services, was defeated in committee by a vote of 14 to 7 on March 9, 1990.

1990 Annual Meeting

Med Chi's Annual Meeting, "The 1990s What Can We Expect?" will be held on May 9-11, 1990 at the Turf Valley Hotel and Country Club in Ellicott City. Med Chi is pleased to announced that Congressman Benjamin L. Cardin will discuss "Federal Legislative Issues" during the theme symposium on May 11, 1990. These speakers will be featured at this year's Annual Meeting:

The Honorable Benjamin L. Cardin
U.S. Representative

Lonnie Bristow MD
AMA Board of Trustees

Victor A. McKusick MD
Professor of Medical Genetics
The Johns Hopkins School of Medicine

Thomas Reardon MD
Commissioner from the Physician Payment Review Commission

John Seward MD
Immediate Past President
AMA Council on Legislation

Arnall Patz MD
National Chairperson of Diabetes Project 2000 for the American Academy of Ophthalmology

John Zapp DDS
Director of Divisional Governmental Affairs, AMA

Ross N. Rubin Esq.
Secretary for the AMA Council on Legislation

During the meeting physicians can visit technical exhibits and can choose from over 40 scientific sessions that will fulfill Category I CME credits. Registrations are welcome at any time. Please call Ralph Tyksinski at Med Chi's Education and Meeting Management Department at 301-539-0872 or toll free 1-800-492-1056 for more information.

Update on New Credentialing Service

Healthcare Credentials Verification, Inc. (HCV) is the name of Med Chi's joint effort with the Maryland Hospital Association (MHA). Plans for this statewide clearinghouse for physician credentialing documents are proceeding on schedule. Med Chi and MHA will jointly announce the appointment of HCVs 12 member Board of Directors by the end of the month, and a search for permanent office space is nearing completion.

For this effort to achieve its maximum benefit for physicians, it is critical to obtain participation of hospitals. If hospitals do not participate in the service, physician's must duplicate the paperwork and record gathering done by HCV. The idea behind this joint effort is to minimize the paperwork and effort required of physicians applying for admission privileges or for reappointment at a hospital. The program also will eliminate the duplicate correspondence and file building now done in hospitals whenever a physician holds privileges at more than one hospital.

Med Chi physicians are encouraged to check with their hospital medical staff office to determine if that hospital is participating in the service. **If the hospital is not participating, physicians should discuss this matter with the chief of the hospital medical staff and the hospital administration.** The Med Chi/MHA joint effort is intended to benefit everyone. Only by working together can we achieve this goal.

New Ethical Opinion

At the Med Chi Council meeting on March 15, 1990 the following Ethical Opinion on the physician's responsibility to patients as affected by contractual agreements was adopted:

Responsibility of Physician to Patient as Affected by Contractual Agreements

> A physician who has a contractual agreement to treat patients continues to have the patient as his primary concern, regardless of the physician's source of compensation. If a conflict occurs between the patient's well being and that of the contracting agreement, the physician must decide in favor of the patient.

Increased Fee Schedule for Medicaid

At its meeting on March 15, 1990, Council voted to support a new Medicaid Open Enrollment Program. The Council's position was to support an across-the-board increased fee schedule. This was considered above other alternate payment plans such as capitation. The preliminary plan provides for increased reimbursement of about 55 percent above current allowances. The increase is intended to encourage a greater number of primary care providers caring for Medicaid patients.

New Publications

Med Chi has two new publications available for member physicians:

Your Patient's Medical Records- a booklet that answers the most commonly asked questions about ownership, access, and release of medical records.

Issues for the Retiring Physician- a guide designed to acquaint physicians with matters that face the retiring physician.

Members can obtain a free copy of both publications during the Annual Meeting. Additional copies or copies to nonmembers are available for a nominal fee. To order, contact Betsy Newman, Med Chi Public Relations Department at 301-539-0872 or toll free 1-800-492-1056.

Med Chi Defense Panels

Physicians are reminded that whenever a member physician is involved in a lawsuit Med Chi will provide a defense panel to evaluate the case. The defense panel consists of physicians certified in the member defendant's specialty who can provide an accurate and objective appraisal of the suit. For every member to receive the maximum benefit of this free service, all physicians asked to serve on the defense panels are urged to participate. For more information about Med Chi's defense panels contact Erica Parker in Med Chi's Legal Services Department at 301-539-0872 or toll free 1-800-492-1056.

Use of Certificates of Medical Necessity

Members should be aware of the growing problem of inappropriate solicitation by medical equipment suppliers. Vendors are using high-pressure sales techniques to persuade consumers they need equipment, and then they are asking the consumer to present a completed certificate of medical necessity form for their physician's signature. Physicians are the only individuals who can determine the home medical equipment necessary for their patients. Physicians who are pressured by a vendor or physicians who feel that questionable practices are taking place should contact the Medicare carrier to report the incident to the Maryland Consumer Protection Division, Health Education Advocacy Unit at 301-528-1840 to obtain a complaint form.

Notice Regarding Retirement Plans

If you are a participant or employer holding assets in a terminated pension, terminated profit-sharing, or terminated stock bonus plan, please read this notice:

> A pension, profit sharing, or stock bonus plan, under which benefit accruals have ceased, is not terminated if.. the plan assets are not distributed... but held in the trust.

In terminated plans, a participant's assets can no longer be held in a trust until he or she reaches retirement age. All assets must have been distributed to the participants by July 3, 1989 in order for the plan to be considered "terminated" by the IRS.

The IRS stated in revenue ruling 89-87 that:

> Under section 7805(b) an eligible plan will be treated as having terminated on the date of plan termination specified by the employer if distribution of all remaining plan assets is completed prior to the later of January 1, 1990, or as soon as administratively feasible after July 3, 1989.
>
> Whether a distribution is made as soon as 'administratively feasible' is to be determined under all the facts and circumstances of the given case but, generally, a distribution of which is not completed within one year following the date of plan termination specified by the employer will be presumed not to have been made as soon as administratively feasible.

Under this provision, terminated plans would have to distribute the assets no later than July 3, 1990.

IF THE QUALIFIED PLAN ASSETS ARE NOT DISTRIBUTED, THE PLAN MUST BE RETROACTIVELY AMENDED TO OPERATIONALLY COMPLY WITH ALL QUALIFICATION REQUIREMENTS.

If you have assets in one of the above listed "terminated" retirement plans, the distribution will be taxed if it is not rolled into an IRA. The QUADS IRA can accept assets that may not be administratively feasible in other IRAs. Mutual funds, stocks, bonds, CDs, limited partnerships, promissory notes, mortgages, real-estate, privately held stock, etc., are all acceptable assets under the QUADS IRA Plan. For further information regarding this matter contact Alan Rifkin, Esq., and Gerard E. Evans, Esq. at 301-974-8352.

Medicare Charges to Physicians

Med Chi has learned that some Medicare carriers are charging physicians for required information, such as information on Maximum Allowable Charges and identification numbers for referring physicians. Med Chi and the AMA maintain that carriers should not charge physicians for information they need to comply with government imposed legal requirements. If you have any information on carriers that maintain an information charge policy, contact Richard Deem at the AMA Washington Office 202-789-7413.

Medicare Program Changes

Effective April 1, 1990 several new Medicare program changes were enacted in the Omnibus Budget Reconciliation Act of 1989 (P.L. 101-239). This act included three key Medicare physician payment reform provisions: (1) a five-year transition to a new payment schedule based on an RBRVS beginning in 1992; (2) a three-year transition to new balance billing limits beginning in 1991; and (3) the establishment of Medicare volume performance standards (MVPS) beginning this year. In addition, the OBRA 1989 legislation also included a number of other new Medicare program changes, many of which were implemented on April 1, 1990. A summary of these changes is presented below.

Sequestration Extension- Effective April 1, 1990, the 2% sequestration will be replaced by a 1.4% sequestration "reduction" in payments through the end of the fiscal year.

Medicare Economic Index (MEI) Increase- Effective April 1, 1990, the MEI increase is as follows:

- 4.2% increase for primary care services (CPT codes 90000-90170, 90300-90580, 92002, and 92004);
- 0% increase for radiology, anesthesia, and "overpriced" services (in addition, the conversion factors used to compute fee schedules for radiologists' services [excluding portable x-ray services] are reduced by 4%); and
- 2% increase for other physician services.

Maximum Allowable Actual Charge (MAAC) Updates- 1990 MAACs are updated as follows:

- If a 1989 MAAC is equal to or greater than 115% of the 1990 prevailing charge level for nonparticipating physicians, the 1990 MAAC equals 101% of the 1989 MAAC.
- If the 1989 MAAC is less than 115% of the 1990 prevailing charge level for nonparticipating physicians, the 1990 MAAC equals the greater of: 101% of the 1989 MAAC or 115% of the 1990 prevailing charge for nonparticipating physicians.

Customary Charges for "New" Physicians- Effective April 1, 1990, the customary charges of new physicians (physicians for whom adequate charge data are not yet available) are limited to 80% and 85% of the prevailing charges in each locality in the physicians' first and second years, respectively. These limits do not apply to primary care services or to services rendered in health manpower shortage areas. Previously, customary charges for new physicians were limited to the lower of the 50th percentile of weighted customary charges. In 1989, these limits were set at 80% of the prevailing charge levels for the first year of practice. In subsequent years, these physicians' customary charges were based on their own actual charges.

Limits on Actual and Prevailing Charges for "Overpriced" Procedures- "Overpriced" physician procedures and services are defined as those that had 1989 prevailing charges that were at least 10% greater than preliminary resource-based payment schedule estimates developed by the Physician Payment Review Commission (i.e., reduced national average prevailing amounts). Approximately 250 "overpriced" procedures and services were identified. Physicians who have 1990 prevailing charges that are reduced by this provision should have received the changes in a "Dear Doctor" letter that was sent by carriers before March 31, 1990.
Effective April 1, 1990, the prevailing charge for identified "overpriced" procedures for participating and nonparticipating physicians will be reduced by the *lesser* of:

- 15% of the 1989 prevailing charge, or
- 1/3 of the percent by which the 1989 prevailing charge exceeds the Locally-Adjusted Reduced Prevailing Amount (LARPA).

LARPAs are calculated by multiplying reduced national average prevailing amounts by geographic practice cost indexes (GPCIs) for each payment locality. (Note: variation in LARPAs reflects *only* variation in the physician "overhead" portion of the reduced national average prevailing amounts.)

As an example, assume that the 1989 prevailing charge for an "overpriced" procedure was $1,000 and the LARPA for a given locality is $800.

- 15% of the 1989 prevailing charge is *$150*;
- 1/3 of the percent by which the 1989 prevailing charge exceeds the LARPA is 8.33%, or *$83.30*.

— the 1989 prevailing charge exceeds the LARPA by 25%
($1,000 - $800 = $200)
($200/$800 = 25%)
— 1/3 of 25% is 8.33%

The 1990 prevailing charge for this procedure would be $916.70 (1,000 - $83.30) because $83.30 is a smaller reduction than $150. (A nonparticipating physician's prevailing charge would be 5% less, or $870.86.)

In addition, nonparticipating physicians providing "overpriced" services that are subject to these reductions will face MAACs and "special" charge limits for these services that will be calculated as follows:

- 125% of the nonparticipating "reduced" prevailing charge,

plus

- 1/2 of the amount by which the physician's MAAC for the procedure for the previous 12-month period exceeds the 125% level.

In such cases, the *lower* of the MAAC or the "special" charge limit will serve as the physician's actual charge limit.

Limits on Actual and Prevailing Charges to Designated Specialties- Effective April 1, 1990, for a number of high volume surgical, radiological, and diagnostic physician services, the prevailing charge for participating and nonparticipating physicians will be limited to the prevailing charge (or fee schedule amount) for the specialty that provides the service *most frequently nationally*. Physicians who have 1990 prevailing charges that are reduced by this provision should have received the changes with their "Dear Doctor" letter. (NOTE: This limitation applies only when a Medicare carrier recognized specialty differentials in the calculation of prevailing charges for a service.)

Similar to "overpriced" procedures, nonparticipating physicians providing services whose prevailing charge levels are reduced as a result of the designated specialty provision, will be subjected to both MAACs and "special" charge limits that will be calculated as follows:

- 125% of the nonparticipating "reduced" prevailing charge, *plus*
- 1/2 of the amount by which the physician's MAAC for the service for the previous 12-month period exceeds the 125% level.

Once again, the *lower* of the MAAC or the "special" charge limit will serve as the nonparticipating physician's actual charge limit.

In addition, it should be noted that *payment reductions due to the designated specialty provision will be applied after reductions have been made as a result of the "overpriced" procedure provision. Thus, the overall reduction for a procedure or service subject to both provisions could exceed 15%.* (Note: 92 of the 250 "overpriced" procedures are subject to the designated specialty provision.)

Special Payment Method for Nuclear Medicine Physicians- Effective April 1, 1990, physicians who submitted charges for nuclear medicine services that accounted for at least 80% of their total Part B charges from July 1, 1988 to June 30, 1989, will be paid based on a blend of 1/3 of the radiology fee schedule amount for the procedure in the locality and 2/3 of 101% of the 1988 prevailing charge level amount for the procedure in the locality.

Time Units for Anesthesia Services- Effective April 1, 1990, fractional time units for anesthesia services will be based on actual time instead of being "rounded" to the next full time unit.

Limitations on Charges for Medicare Beneficiaries Eligible for Medicaid Benefits Effective April 1, 1990, payment on an assigned basis will be required for physician services provided to individuals enrolled under Medicare who are eligible for Medicaid to purchase their Medicaid coverage but not otherwise eligible for Medicaid (Qualified Medicare Beneficiaries, or QMBs). Assignment currently is required for Medicare beneficiaries who are actually enrolled in a state Medicaid program. QMBs are individuals with incomes below the federal poverty level but not eligible for Medicaid.

Related Issues-

- *Local Code Collapsing* - During March 1990, the Health Care Financing Administration (HCFA) began an initiative to collapse or eliminate special local carrier codes as part of its standardization plan to implement the new Medicare physician payment schedule based on the RBRVS. Carriers were to have notified physicians of local code changes by February 15, 1990. The impact of this initiative will vary due to differences in carrier use of local codes.
- *Participation Agreements* - "Dear Doctor" letters, accompanied by physician charge screens and charge limit data *reflecting the changes discussed above*, were to have been mailed by carriers no later than February 28, 1990. Physicians who have not received this information should contact their carrier immediately. Physicians experiencing difficulties in obtaining such information from their carrier may contact the AMA Washington Office for assistance. Participation decisions should have been made by March 31, 1990.
- *Carrier-Assigned Provider Identification Numbers* - "Rendering and performing" physicians are reminded that they must include their local carrier-assigned provider identification number (PIN), not to be confused with the unique physician identification numbers (UPINs) on all Medicare claims. Effective May 1, 1990, assigned claims without carrier-assigned PINs will be rejected, while unassigned claims will be developed (i.e., investigated) for the missing PINs. Assigned claims that are rejected for missing PINs should be resubmitted rather than pursued through the appeals process. Group practice physicians should use *both* their group PINs and their individual PINs provided by the carrier.

Additional Information- Details on other OBRA 1989 provisions will be provided over the next several months.

PLEASE TURN TO OPPOSITE SIDE AND COMPLETE.

Pre-Registration Form

Please check the lectures you are most likely to attend *(for the purpose of room assignments).*

Wednesday, May 9

2:00 - 3:45 p.m.

- ☐ Plenary Session - "Health Care Financing - An American Solution"

3:45 - 5:45 p.m.

- ☐ "Examination of the Expert Medical Witness: A Mock Trial"
- ☐ "Computers in Your Office"
- ☐ "Physician as an Employer in the 1990s"
- ☐ "The Anatomy of a Case"
- ☐ "Children of Working Parents"
- ☐ "The Disease of Addiction - Impact on Feelings"
- ☐ "Reconstruction of the Breast- An Evaluation of Advances and Persistent Problems"

Thursday, May 10

7:15 - 8:45 a.m.

- ☐ Prayer Breakfast - "How Long Have You Had This?"

8:45 - 10:15 a.m.

- ☐ "Physician Character & Personality Traits That Predict Less Than Adequate Practice Standards"
- ☐ "AIDS - A Medical and Legal Review and Update for the 1990s"
- ☐ "Prevention of Blindness by Diabetes"
- ☐ "Practical Techniques for Promoting Your Practice"

2:00 - 3:30

- ☐ "Managing Multiple Risks in Cardiovascular Diseases"
- ☐ "Voice Disorders: Their Recognition, Treatment, and Prevention"
- ☐ "Sick Building Syndrom: Environmental Causes of Respiratory & Skin Allergy Problems"
- ☐ "AIDS in the 1990s - Living Long and Living Well: A Case for Optimism"
- ☐ "The Physician as Gatekeeper - A Professional Contradiction"

8:45 - 12:15 p.m.

- ☐ "The Great Cholesterol Controversies"

10:45 - 12:15 p.m.

- ☐ "Tobacco Dependence as an Addiction"
- ☐ "Movement Disorders in Primary Care and Psychiatry"
- ☐ "The Care of the Alzheimers Patient After Diagnosis"
- ☐ "Panel on Issues in Managed Care in Maryland"

3:45 - 5:45 p.m.

- ☐ "Stroke Care in the 90s: An Update on the Management of Acute Stroke and Stroke Rehabilitation"
- ☐ "Analysis of Physician Practice Variations - Implications for the 1990s"
- ☐ "Hepatobiliary Imaging in Noncalculus Hepatobiliary Disease with Emphasis on Surgically Correctable Disorders"
- ☐ "Young Physicians in the 1990s"
- ☐ "Breast Cancer: The Value of Mammography"

Friday, May 11,1990

8:45 - 10:15 a.m.

- ☐ "Findings of the Statewide Quality Assurance Committee"
- ☐ "Common Sense Approach to the Management of Hypertension"
- ☐ "High Risk Infants"
- ☐ "Modern Management of Communicable Diseases"
- ☐ "Using the Computer for Your Continuing Medical Education"

8:45 - 12:15 p.m.

- ☐ "Symposium - What to Expect in the 1990s" (Physician Payment, Long Range Planning, Legislative Affairs)

10:45 - 12:15 p.m.

- ☐ "Recognition & Management of Melanoma and Its Precursors"
- ☐ "Environmental and Occupational Health Threats"
- ☐ "Long-Term Care Insurance"

1:00 - 1:45 p.m.

- ☐ Victor A. McKusick Lecture

Commitment and Service Since 1975

The *Med Chi Agency* was established by the Medical and Chirurgical Faculty in 1975 and now has over 5,000 physicians and employees as clients.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial products. You will benefit from the many coverages available for both your professional and personal needs. You will also benefit indirectly, because Med Chi owns the *Med Chi Agency* and the earnings from its operations.

For complete information about any insurance product or service, just give us a call. We can provide the answers you seek and the solutions you need.

Reynaldo L. Lee-Llacer MD 1990-1991 Med Chi President

Betsy Newman

Betsy Newman, Public Relations Director, Med Chi

On May 11, 1990 Reynaldo L. Lee-Llacer MD will become the Med Chi's President for 1990-1991. During his term, one of his primary concerns will be the state of our nation's healthcare system. "In the coming years our medical system is going to face many changes. Maryland physicians will need to be informed about these changes."

One of the most important issues for physicians today is the future of medicine in the United States.

Reynaldo Lee-Llacer MD,
Med Chi President 1990-1991

Ideals and Issues

"During the past few years," says Lee-Llacer, "the focus of Med Chi presidents was on improving communication with the membership. Past-president Michael R. Dobridge MD initiated communication meetings (called President's regional conferences) where area physicians could discuss their concerns with the Faculty's elected leaders. Raymond M. Atkins MD, Med Chi President for 1989-1990, embellished this concept and included continuing medical education programs at the conferences." Dr. Lee-Llacer intends to continue regional meetings, especially during the legislative session when interaction between physicians is critical.

Dr. Lee-Llacer views Med Chi's Annual Legislative Rally as an essential tool for notifying physicians about issues in the General Assembly. "Almost 200 physicians and auxiliary members demonstrated unity in Med Chi and showed their support for organized medicine by attending this year's rally in Annapolis," says Lee-Llacer. "We listened to speeches on legislative issues from legislators such as Senate President Mike Miller and House Speaker Clayton Mitchell. After the assembly, we broke up into smaller groups and met with our area legislators." According to Lee-Llacer, the rally not only improved communication but also enabled Med Chi physicians to be involved and to express their opinions to their representatives.

Dr. Lee-Llacer considers Med Chi's "position papers," initiated by 1989-1990 President Raymond M. Atkins MD, to be the culmination of the Faculty's efforts to improve communication to the membership. "These position papers," comments Lee-Llacer, "proved vital to the success of this year's legislative session because they put the physicians of our state in a pro-active position long before the legislative session occurred and enabled us to better

convey our ideas to our representatives. At the same time, these papers allowed legislators to respond to many important issues."

"Med Chi's position paper on Prescription Drug Control and Dispensing, for example, was an important factor in the defeat of the Triplicate Prescription proposal," says Lee-Llacer. He explains that under this proposal, physicians who prescribe schedule II drugs would be monitored by the state through a carbon copy triplicate prescription system. Physicians who often prescribe these drugs might prescribe other forms of medication that do not require a triplicate prescription in order to avoid a government investigation. As a result, many patients would not receive adequate medications for pain.

"I firmly believe that a triplicate prescription plan is an unnecessary and ineffective way to control prescription drug dispensing," adds Dr. Lee-Llacer who supports Drug Commission Chairman Robert R. Neall's alternative plan to track wrongful prescribing practices via a physician's Drug Enforcement Administration (DEA) number. "This plan would curb abuse of all prescription drugs (not merely schedule II drugs) and would have no adverse effects on good physicians or their patients."

The Uninsured and Health Access America

Dr. Lee-Llacer maintains that patient care has been and always must be a physician's primary concern. "We must preserve satisfactory levels of healthcare for the people of Maryland. Most importantly, we must make certain that *everyone* has access to quality healthcare."

Dr. Lee-Llacer believes that one solution to the lack of universal healthcare lies within the American Medical Association's proposal for "Health Access America," a plan to improve access to affordable, quality healthcare for all US citizens. Endorsing this proposal that accents the strengths of our nation's healthcare system Dr. Lee-Llacer states, "Our nation leads the world in providing the highest caliber of comprehensive medical care and education, yet over 33 million Americans do not have health insurance coverage or cannot afford the cost of medical treatment. Health Access America seeks to solve this problem by controlling healthcare cost increases, reforming Medicare and Medicaid, and insuring all Americans' access to the medical system.

"In Maryland, more than 550,000 citizens do not have health insurance," he continues, adding that many of these people do not qualify for government assistance. "Med Chi's position paper on 'The Problem of the Uninsured,' is based on the premise that there should be universal health insurance coverage so that all Americans can access healthcare."

Dr. Lee-Llacer remarks that, like the AMA's proposal, Med Chi's Position Paper supports required employer-provided health insurance that includes tax credits, premium deductibility, and other incentives. Med Chi also supports Medicaid reform, state-level insurance risk pools, and increased taxes on products such as alcohol and tobacco to finance health care programs and research.

"Maryland physicians participate in several programs that relieve problems of the uninsured," Dr. Lee-Llacer adds. "A few years ago Wayne C. Spiggle MD, in cooperation with other physicians in Allegany County, created Allegany Health Right: a nonprofit organization where physician volunteers provide free or low-cost healthcare services to the uninsured. Both Med Chi and the AMA's Health Access America program encourage physicians to participate in volunteer programs until the problem of the uninsured is alleviated."

Healthcare for the Elderly

"Another problem addressed by the Health Access America proposal is Medicare reform," says Lee-Llacer. "Mandated Medicare Assignment is not the solution to Medicare's problems. In 1988 Med Chi surveyed Maryland physicians and discovered that 89 percent participate in Medicare or accept assignment for some of their patients. The Prince George's County Medical Society, under past-president Robert Ruderman MD, developed a system that guarantees patients access to physicians who accept Medicare assignment as full and complete payment of services.

"For senior citizens who cannot get to a physician's office for physical reasons, Prince George's County offers a project where physician volunteers care for patients in area nursing homes," explains Dr. Lee-Llacer.

"Another proposed project in Prince George's County would provide a mobile clinic for patients lacking transportation to go to a physician. The clinic would have an x-ray and laboratory unit and would be staffed by volunteer physicians from Prince George's County. I believe this is a very important step in giving the elderly access to care."

Dr. Lee-Llacer believes that despite physicians volunteer efforts, there is still an enormous challenge ahead for physicians. He refers to the 1988 Maryland

Reynaldo Lee-Llacer MD and his wife enjoy their home.

physicians' survey where 84 percent of physicians provided some form of uncompensated or discounted care. "Physicians volunteer services," comments Lee-Llacer, "can lessen the problem of healthcare costs, but there are many other ways to reduce the cost of healthcare."

Tort Reform

Dr. Lee-Llacer believes more tort reform is necessary to reduce healthcare costs. "Recent tort reforms, such as Maryland's cap on pain and suffering and the new regulations that require a certificate of merit for an expert witness, have played a major role in lowering Maryland's high malpractice premiums and have led to a decrease in malpractice suits.

"Despite recent reductions," says Lee-Llacer, "malpractice insurance is still high." He is opposed to the estimated $13 million spent each year by American physicians practicing defensive medicine in hopes of avoiding potential lawsuits. This not only escalates healthcare costs but also creates barriers in relationships. "Malpractice lawsuits," he professes, "undermine the very fiber of the relationship between physicians and patients.

"Med Chi is developing legislation to achieve further liability reform through a system that will benefit both physicians and patients by reducing the large number of unjustified suits and by allowing case settlements to reach the patient as quickly as possible, without delays and costly legal fees. Such reforms will end the practice of defensive medicine and ultimately lower the barrier between physicians and their patients."

Physician-Patient Relationships

To Dr. Lee-Llacer, the physician-patient relationship is more important today than ever. "I believe that most Med Chi physicians have an excellent rapport with their patients, but when you factor in increasing government regulations, health insurance requirements and the threat of malpractice with the increasing cost of healthcare, the barrier between physicians and patients becomes more pronounced."

Dr. Lee-Llacer stresses the importance of maintaining the basics of good relations with patients by being courteous and attentive to patients' needs. "Patients appreciate physicians who greet them by name, listen actively to their problems, explain their treatments clearly, and respond to their questions. As we enter the 1990s, increasing medical technology may dehumanize medicine. It is every physician's responsibility to insure that their patients feel cared for."

Membership

"The 1990s hold many changes for medicine," asserts Dr. Lee-Llacer. "There will be changes in our nation's medical system, changes in medical technology, and changes in medical treatments. I cannot predict all that will happen, but I am confident in the leadership of Med Chi and the American Medical Association. The Faculty's Council and the House of Delegates are composed of leaders elected by each component society. These leaders represent all Maryland physicians and have their eyes on a vision of tomorrow."

In addition to a strong leadership, Dr. Lee-Llacer emphasizes that all Med Chi members need to be involved. "Organized medicine is intended to represent the interests of all Maryland physicians," reminds Lee-Llacer. "The membership plays an essential role in building the future of medicine. Med Chi represents all Maryland physicians. To accurately represent their opinions, every physician must participate either at the component level or at the state level. By working with each other, we can decide and direct the future of medicine together."

Early Life History

Born in the town of San Fernando in the Province of Mabate in the Republic of the Philippines, Dr. Lee-Llacer was never in love with the idea of becoming a doctor. "I wanted to study at the Philippine Military Academy or the United States Military Academy and go into a military career, but my parents sent me to medical school." He attended the University of Santo Tomas in the Philippines and, after several "tedious" years of study, he graduated in 1958.

Because the residents of his home island of Ticao needed a physician and refused to accept a physician not from the island, Dr. Lee-Llacer became one of Ticao's three municipal health officers. An employee of the government, Dr. Lee-Llacer's main function was to help his countrymen survive diseases like tuberculosis in a place where people die daily from pneumonia and flu. Dr. Lee-Llacer affirms that his experiences during his three-year term as a medical health officer were very rewarding for a young physician.

During his tour, he helped manage a typhoid fever epidemic as well as an outbreak of cholera. "Many people died," recalls Dr. Lee-Llacer. "I saw many of my friends come in sick when an hour before they were fine. We did not have much medicine or antibiotics so wehad to rely on hydration to get people well."

Since Ticao did not have a hospital, the Philippine health department during his second year as a health officer ordered Dr. Lee-Llacer and his chief, Victor Butalid MD, to establish an emergency hospital. With medical equipment they found or created, they set up a makeshift hospital in Philippine Congressman Emilio Espinosa's house. New medical instruments were rare in the Philippines, so they borrowed most of the hospital's instruments and constructed several retractors from forks and spoons. Despite their resourcefulness, the hospital lacked many necessities. There were no x-rays and no sophisticated laboratory equipment. Patients with stab wounds to the kidney had an entire kidney removed to stop the bleeding.

Reynaldo Lee-Llacer MD performs surgery on a patient in the Philippines.

General anesthesia was nonexistent. Dr. Lee-Llacer was forced to rely on local anesthetics for all procedures. Unless they fainted, patients remained awake for all operations.

Dr. Lee-Llacer recalls a young man who was brought to the hospital after his face was hacked by a machete. The cut was across the bridge of the nose, across the malar bone, exposing his maxillary sinus. "The fragment of cheek bone was flapping downward across his face exposing a large hole. We cleaned the wound with Zephiran solution because it was the only antiseptic we had in the hospital. I began to infiltrate the area with Xylocaine until I ran out of it. I flipped the fragment back into its anatomical position. When I began to place sutures, there was no anesthetic left. The patient and I cooperated to finish the task, and I bandaged the area. He went home in three days. Six months later he came up to me at a cockfight and said, 'Doctor, don't you recognize me? I was the one with a cut in the face.' When I looked at his face I could not see a scar."

The most common traumatic injury in the new hospital was from dynamite blasts. Dynamite fishing was an illegal but often used practice among Filipinos. Fishermen mixed dynamite into a bomb that exploded in the water and killed any fish in the area. Oftentimes it was the fishermen and not their catch that would become the dynamite's victims, and they were rushed to the hospital for emergency treatment.

Dr. Lee-Llacer recalls another patient who was preeclamtic. "It was during a typhoon. When the wind brewing outside became extraordinarily strong, the patient went into convulsions and labor pains. We brought her to our delivery room and delivered the baby. Just after the birth, the convulsions stopped, and the patient was well. Suddenly, the typhoon blew off the roof of our hospital and the lights exploded. We were in complete darkness, sopping wet. We delivered the placenta in complete darkness."

Internship and Residency

In 1962, Dr. Lee-Llacer came to the United States to complete his internship and began his surgical residency at Prince George's General Hospital in Cheverly, Maryland. In 1967 he began his fellowship in Shock Trauma at the Shock Trauma Unit and at the Pulmonary Physiology Laboratory at the University of Maryland Hospital in Baltimore. Two years later he was appointed as House Surgeon for the Fairfax Hospital in Falls Church, Virginia.

He served at Fairfax until 1970 when he opened a private surgical practice in Clinton, Maryland. He became a Fellow of the American College of Surgeons in 1973 and is also a Fellow in the Southeastern Surgical Congress as well as the American Society of Abdominal Surgeons. He is board certified in General Surgery.

Professional Endeavors

Although caring for patients is his primary concern, Dr. Lee-Llacer has shown profound interest in all facets of the medical community and has taken an active role in medicine at all levels.

At the county level, he served on the Executive Board of the Prince George's County Medical Society for six years where he was elected to serve subsequent terms as Treasurer, Secretary, and President-elect. In 1983-1984 he became President of the Society. In addition, Dr. Lee-Llacer was appointed chairman of several county and local hospital committees.

As a result of his outstanding work in Prince George's County, he was voted to the Med Chi Council in 1984. The following year, he was named Med Chi's third vice-president and became Med Chi's second vice-president in 1986. After a successful term, the Council elected him as vice-chairman and then chairman where he served from 1986-1988. In 1989, he became Med Chi President-elect.

In addition to his work in organized medicine, Dr. Lee-Llacer is a member of the Board of Physician Quality Assurance and was a commissioner with the Commission on Medical Discipline from 1983 to 1988. He was a Governor's appointee to the Maryland Shock and Trauma Negotiating team from 1984 to 1986.

At the national and international levels, Dr. Lee-Llacer is a member of the American Medical Associa-

Dr. Manuel Gonzales and Dr. Zorayda Lee-Llacer care for a patient during a physician volunteer medical mission to the Philippines.

tion and serves on the board of Governors for the Association of Philippine Surgeons in America where he was elected Governor in 1986 and was vice-president in 1986-1987. He is also a member of the governing board of the Society of Philippine Surgeons in America and a member and past-president of the Philippine Medical Association of Metropolitan Washington, DC. All these organizations work to provide medical care for Philippine citizens and frequently send teams of volunteer physicians on medical missions.

Philippine Medical Missions

Dr. Lee-Llacer has returned to the Philippines on several of these missions. On one trip, he worked in conjunction with the Philippine Medical Foundation, Inc., a nonprofit organization whose aim is to provide charity, education, and medical care to indigent patients. "There were many patients there with cleft palates and cleft lips," says Dr. Lee-Llacer. "I am not a plastic surgeon and had no experience in plastic surgery, but I could not send them home. I selected five patients on whom I believed I could satisfactorily perform the operation, which I did."

In 1988 the Philippine Medical Association of Metropolitan Washington, DC dispatched a group of physician volunteers to the Philippine Province of Sorsogon on the southern tip of Luzon island. Dr. Lee-Llacer was part of a small medical team who saw over 300 patients and operated on over 55 cases in a four-day period.

"When we left the area, there were still many patients waiting for care," comments Dr. Lee-Llacer. "We felt badly because we could not accommodate them all. Those who we could operate on had an expression of silent gratitude in their eyes. Those unable to receive an operation were very disappointed. I expected them to react that way. I told them that we would come back, and we shall."

Another Philippine medical team trip is planned for December 1990. However, when Dr. Lee-Llacer returned for a brief family visit in March 1990, many townspeople came to request medical treatment. He diagnosed and treated more than 30 patients in one day.

Family Life

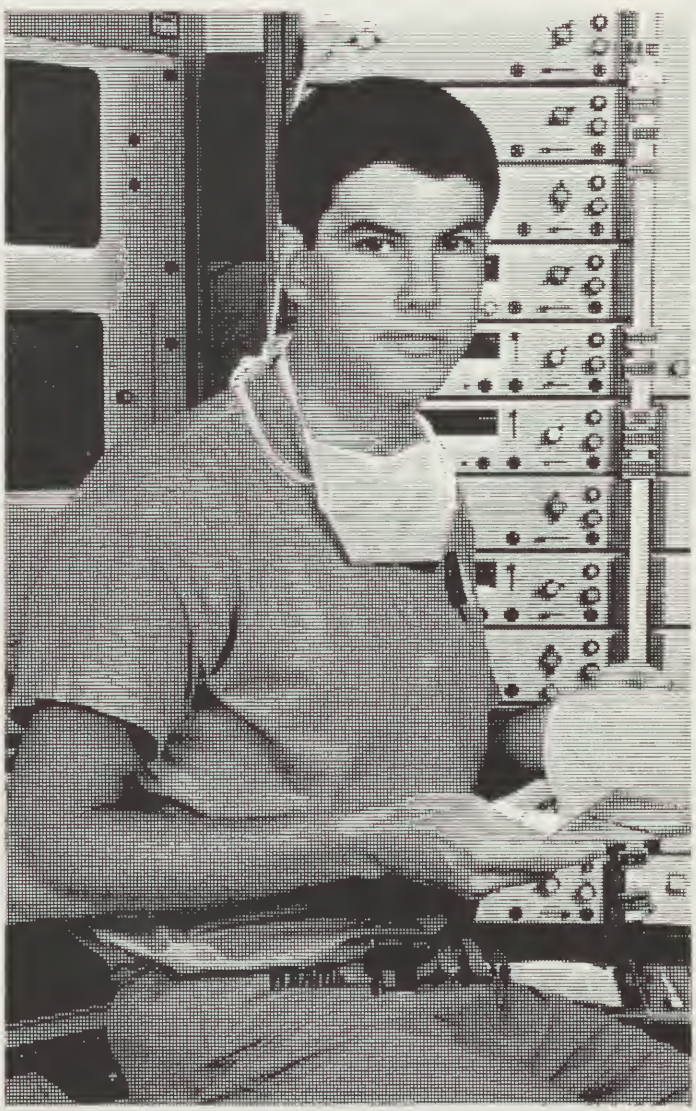
Dr. Lee-Llacer's strong allegiance to Philippine culture is evident in his family life. "I believe in the closeness of the family," he explains. "I think that family should take care of each other. One responsibility that the family must perform is that the younger should take care of the older. The parents should take care of the young; and the young, when they become parents, should take care of their older people. I do not believe that the place for the elderly is in a nursing home. The family should take care of them."

Dr. Lee-Llacer and his wife Zorayda have five children. He describes his children as a well-mannered, refined group and praises their accomplishments, "I believe we have raised a good group of kids that we can be proud of. American kids that will help America.

The Lee-Llacer family: Standing (l to r) Jason, 14; Manuel, 26; Cheryl-Ann, 22; Carl, 16; Sitting: (l to r) Reynaldo Lee-Llacer MD; Zorayda Lee-Llacer MD; Renaldo, 21.

"As a family, we enjoy each other," comments Dr. Lee-Llacer. "We like to watch professional football games, especially when the Redskins play." Other Lee-Llacer family hobbies include skiing, swimming, and photography.

Goals as President



Dr. Lee-Llacer looks forward to the continuation of Med Chi successes during his term as President. "Med Chi is one of the oldest state medical organizations in the country. We can attribute many of our greatest accomplishments to our past-presidents," says Lee-Llacer.

"We can expect many changes in our healthcare system during the decade to come. During my year as president of Med Chi, I intend to inform the membership about these changes, and I will do my best to preserve and protect the quality of medicine practiced in Maryland." ■

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we can offer the kind of flexible time scheduling that allows a physician to share sixteen hours a month with his or her country. We can arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility that could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be; call our Army Medical Personnel Counselor:

Estimates of Public Costs for Teenage Childbearing in Baltimore City in FY 1987

John Santelli MD, MPH; Lisa Rosenblatt MHS; and Anne Emanuelle Birn MA

From School and Adolescent Health Services, Baltimore City Health Department, 303 East Fayette St., Baltimore, MD 21202.

In 1987 Baltimore City spent about $179,500,000 on AFDC, Medicaid, and food stamps for families that were begun when the mother was a teenager. Had all these births been delayed until the mother was at least 20 years old, Baltimore would have saved almost $72,000,000 in public outlays.

Teenage parenthood may be both the cause and the consequence of impoverishment, unemployment, unstable families, and decreased life opportunities. To better understand the impact of adolescent parenthood, the Baltimore City Health Department undertook an analysis of the public costs of adolescent childbearing in Baltimore City. These costs were estimated using a computerized set of procedures developed by the Center for Population Options in Washington, DC.[1]

Great attention has been paid to the issue of teenage parenthood in Baltimore and in the entire United States. Although concern appropriately focused on the personal and individual effects of adolescent parenthood, the populationwide impact may be more easily quantified. Four types of costs can be linked to teenage parenthood. The first two are the so-called intangible costs: they profoundly affect people and society, but they are difficult to quantify in economic terms. First are the *personal* costs that may result from high-school dropout and the ensuing loss of opportunity and income, from single parenthood, and from the truncating of life plans. Second, the *social* costs of teenage childbearing are composed of the aggregate of these individual losses combined with the overall impact on the social fabric of large number births to young parents. Although careful socioeconomic analyses have shown that teenage motherhood is primarily a symptom of low socioeconomic status, adolescent parenthood also can serve as a contributing factor to poverty.

The third and fourth consequences are tangible costs that can be measured in dollars and cents. The third group are the *private* costs, those shouldered by the extended family and friends of the teen parent. Grandparents and other relatives may bear the burden of childraising through direct expenses until the adolescent is able to provide for his or her new family. These private costs may occur instead of (or in addition to) public expenditures. In many cases, grandparents may be unaware of or impeded from receiving public assistance for raising poor children.

Finally, the fourth set of costs (and the focus of this article) are the *public* costs incurred by adolescent childbearing. For Baltimore City, these major public expenditures include three

programs: Aid to Families with Dependent Children (AFDC), Medicaid, and Food Stamps. Three types of public expenses can be calculated: "single year costs," the annual public expenditure for families begun by a teenage parent; "single birth costs," the total average public cost of raising a child (to adulthood) born to a teenage mother; and "single cohort costs," the aggregate, 20-year cost of raising all children born to teenage parents in a given year.

For a city of its size, Baltimore has one of the highest rates of adolescent parenthood in the country. In 1987, there were 13,463 live births to Baltimore residents; 3,093 or 23 percent of these births were to mothers 19 years old and younger and over 10 percent were to mothers under 18. Over 40 percent of all first births were to teenage mothers, and 27 percent of teen births were repeat births.[2]

Baltimore historically has experienced exceptionally high rates of teenage parenthood. In 1963, 23 percent of live births were to teenagers, a rate that climbed to 31 percent in 1975. Although the proportion of children born to adolescents has declined since the mid-1970s, it remained steady at 23 percent from 1985 to 1987. Indeed, the proportion of first births and the percentage of repeat births to teenagers have been increasing in the last few years. Moreover, the proportion of births to unwed teenage mothers has been increasing steadily from approximately 25 percent in 1963 to over 91 percent in 1985.[3] This trend is important because unmarried teens have even less family support than married teen parents.

For the entire United States, 13.1 percent of live births in 1984 were to a teenage mother, with approximately 5 percent to mothers aged 17 and younger. Twenty-four percent of all first births in 1984 were to adolescents.[4] Compared to five other developed countries, the United States has a substantially higher teenage birth rate at every age, with the most marked differences in the youngest age groups. For example, the teen parenthood rate at age 14 is more than four times higher in the United States than in Canada, the only country that begins to approach US rates. Moreover, availability of public assistance cannot explain the high teen birth rate in the US; on the contrary, the US provides by far the least amount of public welfare assistance among industrialized nations.[5] Poverty and unemployment rates, however, are significantly higher among American teens, serving as the principal antecedent to high teen parenthood rates.

Our study estimates the public costs for adolescent child bearing in Baltimore City for fiscal year 1987, the most recent year for which statistics are available.

Methods

The Bureau of School and Adolescent Health Services of the Baltimore City Health Department recently conducted a study to determine the public costs for teenage child bearing in Baltimore City in FY 1987. The research methodology is based on a set of procedures developed by the Center for Population Options (CPO) in Washington, DC.[1] The Center is a nonprofit, national organization that works with schools, clinics, policy makers, and religious organizations in developing strategies to prevent teenage pregnancies.

Using CPO's format for data collection and analysis, three different sets of costs have been calculated. The first, "single year costs," quantifies the amount of money Baltimore City spends on teenage child bearing in a given year. The total public outlay in a given year includes expenses for all families started by teenage mothers, that is, in which the first birth occurred when the mother was a teenager, even though the mother may now be considerably older. Specifically, the public expenses include the expenditures for Aid to Families with Dependent Children (AFDC), Medicaid, and food stamps for families begun by a teen mother. The figure includes direct payments to individuals and service providers, as well as the administrative costs of these programs. It should be noted, that the resulting number represents only minimal public costs: it does not include other services such as housing, special education, child protection services, foster care, day care, and other social services. Private costs (for example, costs borne by relatives or private organizations) are not included. Also excluded from the calculations are intangible or indirect costs such as loss of future income resulting from missed educational opportunities.

The information on public expenditures was obtained from a number of different city and state agencies: Baltimore City Department of Social Services, Baltimore City Health Department, State of Maryland Department of Health and Mental Hygiene, and State of Maryland Department of Human Resources. Each agency was contacted both in writing and by phone to confirm the accuracy of the information they provided. In addition, where possible, the statistical and annual reports used by the various agencies to calculate the data were obtained.

To determine "single year costs," the percent of AFDC families headed by women who started their family as teenagers is used as a multiplier. As local data were not available, the national figure of 53 percent provided by CPO was used. The figure for Baltimore is undoubtedly higher because teen birth rates in Baltimore are substantially higher than national rates; over 40 percent of all first births in Baltimore are delivered to teenage mothers.[2] Nationwide, only 25 percent of first births are delivered to teenage mothers.[4]

The second public cost calculated for Baltimore City represents the amount expended over a 20-year period for a single family begun by a teen birth. These "single birth costs" provide an estimate of what a family begun by a first birth to a teenager in a given year will cost the public by the time that baby reaches adulthood. The calculations take into account expenditures for AFDC, Medicaid, food stamps, public housing, and social services. The resulting number is *average* cost of a single

family begun by a teen birth. Two out of three teen mothers do *not* receive public assistance. This estimate also takes into account the possibility that an adolescent mother eventually will be able to find employment and no longer need public assistance.

To arrive at a figure, only first births are considered, and the costs of subsequent births are then added to the cost of the family begun by a teenage mother. An early first birth increases the probability that a woman will have more children than average. Teenagers who have their first birth before the age of 18 will have 2.1 children by age 22, 2.8 children by age 27, and 3.2 children by age 32. Those who have their first baby at 18 or 19 will have 1.6 children by age 22, 2.4 children by age 27, and 2.8 children by age 32. These figures are used to calculate annual average increases in family size that, in turn, are used to calculate the number of family members eligible for benefits and future medical expenses associated with pregnancy and child bearing.

In calculating "single birth costs," teenage girls aged 14 and younger, aged 15 to 17, and aged 18 to 19 are considered separately. All future costs are discounted to the value of 1987 dollars. Discounting deflates projected future costs by the amount that money invested now could earn by that year, adjusting for inflation. Four percent is used as the discount rate.

The final cost determined for Baltimore City is the "single cohort cost." This figure represents the cost of all families begun by births to teenagers in a given year up to the time that those babies reach adulthood. As with the "single birth cost," only first births are considered, and the costs of probable subsequent births are then added to that family's costs. The same age groupings and discounting procedures used to calculate "single birth costs" are used to calculate "single cohort costs."

Even if all teenage mothers were able to delay their first birth until age 20, some of these families would still require public support. The CPO methodology includes a procedure useful for assessing the amount of money Baltimore City would have saved in public expenditures if all teenagers who had given birth in FY 1987 had delayed giving birth until they reached at least age 20. In most cases, efforts to prevent teen pregnancies will only delay births until the woman is in her twenties. Thus, these savings are only 40 percent of the full cost (a percentage derived by CPO) because even if births are delayed, most women will have children, and many will still require welfare assistance. However, the likelihood of requiring public assistance is reduced substantially if the first-time mother is over 20 years old.

Results

In FY 1987 Baltimore City spent $179,469,186 in AFDC, Medicaid, and food stamps on families that were begun when the mother was a teenager (Table 1). Had all these births been delayed until the mother was 20 or older, Baltimore City would have saved $71,787,674 in FY 1987. A local figure for the percentage of AFDC families started by teenage mothers was not available, so the national estimate of 53 percent was used. Based on Baltimore demographics, a local estimate clearly would exceed the figure based on national data that was used. Thus, these calculations significantly underestimate the public costs to Baltimore City.

For the category "single birth costs," a figure was calculated for each of the three age groups: 14 and younger, 15 to 17, and 18 to 19. It was found that a family begun by a first birth to a teenager aged 14 and under in FY 1987 in Baltimore City will cost the public $20,394 over the next 20 years (Table 2). If this birth had been delayed, Baltimore City would have spent $8,156 less over the next 20 years. The same calculations revealed that a family begun by a first birth to a teenager aged 15 to 17 in FY 1987 will cost $20,341 over the next 20 years. If this birth had been delayed, there would have been an $8,136 reduction in public outlays during the same two decades. For teenagers 18 to 19 the public expenditures would reach $12,871 over the next two decades, whereas $5,150 less would have been allocated over the next 20 years if the teenage birth had been delayed. An average figure for all teenagers aged 19 or less would be $16,766, with corresponding savings of $6,706. Again, one must recall that the "single birth costs" represent a figure averaged over all births to teenagers, two-thirds of whom will not require public assistance.

The "single cohort costs" for Baltimore City represent the projected public costs for *all* teens having their first births in FY 1987 until those babies reach adulthood. Using CPO's methodology it was calculated that all families begun by teen births in FY 1987 in

Table 1. Estimate of Public Outlays in 1987 Attributable to Teenage Child Bearing for Baltimore City and Maryland[1]

Funding Source	Total Outlay for AFDC Recipients	Outlay Attributable to Teenage Child Bearing[2]
Baltimore City		
AFDC	$164,494,304	$87,181,981
Food Stamps	60,905,921	32,280,138
Medicaid	113,220,881	60,007,067
Total	338,621,113	179,469,186
Maryland[3]		
AFDC	287,000,000	152,000,000
Food Stamps	83,000,000	44,000,000
Medicaid	238,000,000	126,000,000
Total	606,750,000	321,580,000

1. Single Year Cost in 1987 dollars, including administrative costs.
2. Based on the assumption that families begun by a teen birth consume 53 percent of these funding streams.
3. Estimates from Adolescent Pregnancy in the South. Washington, DC: Southern Regional Project on Infant Mortality, 1988;April:29.

Baltimore City will cost $37,907,298 over the next 20 years in 1987 dollars. If these births had been delayed, Baltimore City would have saved $15,162,919 over the next 20 years in 1987 dollars.

In each case, the full costs represent the actual cash expenditures that will be borne by the public as a result of teen child bearing. The marginal costs (or potential savings of 40 percent of the full costs if pregnancies were delayed until a woman reached age 20) provide a more realistic picture of the actual costs attributable to teenage child bearing. Even with postponed births, most women will have children, and some of them will still require public assistance.

Discussion

Our calculations demonstrate that the 1987 public costs of teenage parenthood in Baltimore City are substantial. We estimate "single year costs," the total annual public outlay for families begun by a teenager, at $179,469,186. The "single birth cost," the amount spent to support a family begun by an adolescent parent over a 20-year period, is gauged at $16,766. The "single cohort costs," the public expenditures for all families begun by a teen mother in 1987, followed until their children reach adulthood (20 years), are calculated at $37,907,298. Table 3 displays Maryland and Baltimore City results, together with the six other national and local studies estimating the costs of teenage parenthood. As in our Baltimore analysis, these studies have calculated three sets of public costs, which include expenditures on AFDC, Medicaid, and food stamps; some of these studies also included other public costs such as housing, special education, foster care, day care, and other social programs. Table 2 delineates the public costs of teenage child bearing by age group for Baltimore City, along with the potential savings (40 percent of full costs) if births had been delayed until after adolescence. Table 1 summarizes the components of public welfare outlays and the associated proportion attributable to teenage parenthood for Maryland and the City of Baltimore.

Our estimates, particularly for single-birth costs, closely follow CPO's study, which generated figures somewhat lower than previous estimates. CPO estimates are lower because legislative changes in the early 1980s made access to public assistance more difficult. Differences between the 1985 CPO estimate and the 1987 Baltimore City estimate can be ascribed to inflation and the greater likelihood that Baltimore City families will receive public assistance. Because of data limitations, particularly the percentage of public assistance families that are started by teenagers, our estimates are probably quite conservative. A better estimate of this percentage and other costs would have

Table 2. Public Cost of First Births to Teenagers in 1986 and Potential Savings Associated with Delaying these Births[1]

	Age at First Birth			
	<15	15-17	18-19	All Teens
First births[2]	119	1,059	1,083	2,261
Single birth

1. For US as a whole; expressed in present value 1979 dollars.
2. For Mecklenburg County (Charlotte), NC; expressed in present value 1979 dollars.
3. For St. Louis City and 8 surrounding counties; expressed in present value 1981 dollars.
4. For the US as a whole, expenditures estimated for 1975, in 1975 dollars.
5. For the US as a whole, expenditures estimated for 1990, in constant 1982 dollars, incorporating the more restrictive eligibility criteria for welfare programs legislated by the Omnibus Budget Reconciliation Act of 1981 (P.L. 97-35).
6. For Monroe County (Rochester), NY; actual expenditures for 1977 and 1978.
7. 1985
8. 1986

increased our overall cost estimates by 20 to 60 percent.

Methodological Considerations

When analyzing the aggregate public costs of teenage parenthood, one must bear several issues in mind. First, the expenditures calculated above include only the most direct forms of subsidy to families begun by teenagers: AFDC, Medicaid, and food stamps. Other costs that were not considered almost certainly play a role in the public support for teenage child bearing: housing, special education, foster care, day care, child protective services, and other social services.

It is essential to remember that the figures calculated represent the *average* costs incurred by overall teenage child bearing, not the actual outlays to individuals. *Two-thirds of teenagers giving birth do not receive public assistance.* Thus, the amount $20,341 is assigned to the total public cost of a birth to a 15 to 17 year old, but two out of three such families do not require public assistance. The cost per actual recipient of public assistance would be three times this figure or over $60,000 by the time the child reaches adulthood.

One crucial data element for Baltimore City was not available: the percentage of families on welfare begun by teenagers. This data element is a multiplier used in each estimate of public costs that was calculated. In its place the corresponding national estimate derived by CPO was used: 53 percent. This is undoubtedly an underestimate. Nationwide, 24 percent of first births in 1984 were to teenagers,[4] while in Baltimore over 39 percent of first births were to teenagers in 1985.[3] Presumably the correct estimate of welfare families begun by teenagers in Baltimore City lies between 60 and 80 percent. The three estimates for public costs of teenage parenthood would be correspondingly 20 to 60 percent higher. Collection of this data by social service providers in Baltimore would facilitate future estimates of these costs.

Finally, an important issue is whether to calculate the actual total public costs attributable to teenage parenthood or to determine how much *more* a birth to a teenager costs than a later birth. Although teenage parents incur public costs at a higher rate than older parents, the latter group also retains some likelihood of becoming recipients of government support. The difference between the two sets (the marginal cost) represents the amount that could be saved if the teenager delayed childbirth until later years. CPO recommends calculating the marginal costs of adolescent child bearing as 40 percent of the full costs; thus, the public could expect to save 40 percent by completely eliminating teen births.[1]

Table 4. Consequences of Teenage Parenthood

Health risks and outcomes
Maternal morbidity and mortality
Prematurity/low birthweight babies
Miscarriages/stillbirths/abortion
Early childhood injury/hospitalization
Educational attainment
Lower likelihood of obtaining h.s. diploma/college diploma
Diminished educational achievement/motivation
Increased dropout rate/decreased school performance for fathers
Family structure and family size
Higher rates of marital failure
Closer spacing of births/higher rates of unintended births
Work status and income
Higher unemployment rates
Lower wages
Low job satisfaction ratings
More likely to be in single-income families
Disproportionately dependent on public welfare for income support/Medicaid
Outcomes for children of teenage mothers
Greater risk of low academic achievement
Increased social, behavioral, and emotional problems
Higher likelihood of becoming teen parents
Diminished family stability

Source: Consequences of adolescent child bearing. In Hayes, CD. Risking the Future: Adolescent Sexuality, Pregnancy and Childbearing Vol I. Washington, DC: National Academy Press, 1987.

Social Consequences of Teenage Parenthood

In 1968, Arthur Campbell offered this description of the consequences of teenage childbearing:

> The girl who has an illegitimate child at the age of 16 suddenly has 90 percent of her life's script written for her. She will probably drop out of school, even if someone else in her family helps to take care of the baby; she will probably not be able to find a steady job that pays enough to provide for herself and the child; she may feel impelled to marry someone she might not have otherwise chosen. Her life choices are few, and most of them are bad. Had she been able to delay her first child, her prospects might have been quite different.[6]

While Campbell clearly overstated the case (his remarks were founded on little empirical evidence) adolescent child bearing may have profound social consequences on the life course of a young woman.[7] Subsequent studies have corroborated some of Campbell's statements, drawing clear links between adolescent parenthood and lower socioeconomic status, poorer educational attainment, and health and developmental risks for mothers and their families.[4] In the long term, however, these patterns tend to ameliorate. Recently published longitudinal research has revealed that a "substantial majority" of teenage mothers eventually receive a high school diploma, find regular work, and attain economic independence, even if they were once dependent on public assistance.[8]

Nonetheless, the social consequences of unintended teen births remain far reaching, at least in the short term.[4] For the adolescent parent, marital patterns tend to be less stable, subsequent fertility higher, educational attainment lower, and labor force participation less favorable for persons who experience first births as teenagers rather than at older ages.[6]

Much of the impact on employment is a direct consequence of the young mother's inability to finish her education. Children of adolescent mothers are more likely to endure poor social and educational outcomes

and more likely themselves to become adolescent parents. Finally, the children of adolescent mothers are more likely to grow up in large, poor, single-parent households, with less parental attention and lower expectations of achievement.[9] Conversely, the circumstances of poverty and unfavorable life prospects make parenthood a more viable option for socioeconomically disadvantaged youths.

The immediate medical consequences of teen child bearing also can have profound long-term effects. First, the teen mother may herself suffer from adverse health effects, including higher rates of pregnancy complications and higher maternal mortality. She is more likely to have recourse to abortion. Teen mothers are more likely to deliver low birthweight babies and to experience elevated levels of infant mortality. Late enrollment in prenatal care, frequently associated with teenage pregnancy, creates a suboptimal condition for childbirth and child rearing.

Adolescent parenthood results in adverse economic circumstances for the individuals involved and for society at large. Child care for working women is difficult to secure, and many women are forced to remain in the home when they might prefer to work.[9]

Teenage fathers also are likely to encounter unfavorable economic circumstances. Fathers who support their offspring may have to drop out of school to work full-time. Because the image of fatherhood remains paradoxically inconsistent with the notion of fathering, many adolescent males do not financially or emotionally support their families. Instead, female-headed families often must rely on other relatives or state assistance to help make ends meet. The father's absence may create a tremendous psychological burden on all parties.

Conclusions

Given the enormous public costs of teenage child bearing and the potential public savings of reducing or eliminating adolescent births, an examination of the means of preventing teenage parenthood is warranted. First, an analysis of the expenditures, expectations, and cost effectiveness of teenage pregnancy prevention programs is necessary. Compared to the annual outlays of $179,469,186 for families begun by teenagers, public expenditures for prevention are limited. Maryland is reputed to spend more state funds on gypsy moth eradication than on public programs for adolescent pregnancy prevention.[10] Moreover, it is essential to realize that reproductive health initiatives are most successful when enacted in conjunction with the development of fulfilling work prospects for teenagers of disadvantaged backgrounds. This second component, while a seemingly unwieldy and even daunting task, serves as the crucial complement to the behavioral change strategies promoted by the health department.

In the end, pregnancy prevention efforts directed toward teenagers may lessen the public costs of child bearing but will not result in the disappearance of government support for raising children. However, delaying parenthood until the mother reaches her twenties may have other beneficial effects. Teenagers may remain in school longer. Their job prospects may improve. Increased educational opportunities for teenagers may lead to a rise in earning potential and financial security. The stability of families may be enhanced. The self-esteem and life prospects of young men and young women may be strengthened. Conversely, improved career and life opportunities for teenagers suffering from socioeconomic discrimination undoubtedly will reduce teen parenthood rates as well as numerous other social problems over the long term. The "return rate" for public investment in both socioeconomic progress and primary prevention will accrue not only to the public treasury but also to thousands of young families.

Focus Review: An Old Concept Revisited

Ira R. Horowitz MD

From The Johns Hopkins Medical Institutions, Department of Gynecology and Obstetrics, Baltimore. Reprints: Ira R. Horowitz MD, Johns Hopkins Hospital, Dept. of Gynecology & Obstetrics, 600 N. Wolfe St., Houck Bldg., Rm. 205, Baltimore, MD 21205.

Medical students throughout the world learn clinical skills in a physical diagnosis course. Clinicians can use this approach to design a focus review to serve as a method of evaluation in the quality assurance of healthcare and as a research tool.

Monitoring and evaluation of the quality of healthcare in the United States was formalized by The American College of Surgeons (ACS) in 1919. In 1951, the ACS encouraged additional professional organizations to participate in their Hospital Standardization Program and thereafter formed the Joint Commission on Accreditation of Hospitals(JCAH).[1] The JCAH's Agenda for Change during the next several years encourages institutions to identify clinical indicators and provide criteria statements. The federal government, state legislatures, and medical specialty organizations also are requiring qualitative and quantitative measurements in healthcare quality.

Risk Management, Utilization Review, and "Focus Review"

In 1983 the JCAH began a major endeavor to have hospitals integrate all activities of Quality Management: quality assurance, risk management, and utilization review. During the past three years, Quality Management also has come to the legislative forefront: a multitude of federal and state legislation requires qualitative and quantitative measurements in healthcare quality.

The Health Care Finance Administration (HCFA) has been releasing the mortality data of hospitals based on reimbursement claims from Medicare and is attempting to release physician-specific statistics based on this data. Unfortunately, their data is difficult to validate and will be used to evaluate physician performance by Diagnosis Related Group (DRG) and outliers[2] without consideration of comorbidities and severity of illness. Claims data have not proved an effective measurement of medical practice.[3-5] The Health Care Quality Improvement Act of 1986 (QIA)[6] provides for the establishment of a national clearinghouse for malpractice and disciplinary data on physicians. Several states including Maryland and California have also passed legislation requiring hospitals to report disciplinary actions to the state medical boards. Credentials ultimately are tied to the quality of care given in Maryland House Bill 560. Each hospital is required to

keep active risk management files on each physician. Prior to renewing privileges the hospitals are required to contact each institution where the physician has been granted privileges.

Table 1. Components of the Medical History* and Author's Suggested Methodology for Focus Review Design

PATIENT HISTORY & PHYSICAL EXAMINATION	FOCUS REVIEW CONCEPTS	FOCUS REVIEW TO EVALUATE PULMONARY EDEMA
I. Identification and Vital Statistics	I. Identification of population, size, diagnoses, time period, sampling method, and data sources.	I. Sample Definition - All patients diagnosed with pulmonary edema - list by age, admitting service and identification number.
II. Informant and relationship to patient	II. Person to coordinate Focus Review and Quality Assurance/ Utilization Review Coordinator	II. Data Abstractor: abstract data is clinically involved in the area of specialized practices.
III. Chief Complaints	III. Problem/indicator driving the Focus Review (Statistical Trends)	III. In a 3 month experience, 20% of the patients were diagnosed with pulmonary edema as a secondary diagnosis.
IV. Present Illness	IV. Identification of problem, justification for evaluation, expected impact on health care or validation of outcome	IV. Patients requiring loop diuretics to be evaluated: A. Observe trends in nursing care and documentation, medical practice, and disease process using pre-set criteria.
V. Past History a. General Health b. Infections c. Operations and injuries d. Previous hospitalizations e. Systems Review	V. Review of indicators: Orders, treatment plan, diagnostic tests, intervention, risk factors, physical examination findings and diagnosis.	V. Note if the following are documented: A. Pituitary lesion B. Cardiac disease C. Lung disease D. Renal disease E. Review of IV orders 1. I & O by M.D. 2. I & O by R.N. 3. Time order written 4. Time executed F. Identification of pulmonary edema: Yes or No 1. Time of Identification 2. Treatment of pulmonary edema
VI. Social History	VI. Identification of practice trends that precipitate indicators for focus review that can be altered.	VI. Previous Trends A. Patients previous hospitalization complicated by pulmonary edema
VII. Family History	VII. Predisposing factors that impact patient care. i.e. Practice patterns.	VII. B. Primary nurse or nursing unit has several patients with pulmonary edema. C. Physician has several patients with hospital courses complicated by pulmonary edema.
VIII. Physical Examination	VIII. Observed Outcomes Findings, Chest X-Ray, and other diagnostic tests.	VIII. Physical Examination Electrocardiogram, Arterial Blood Cases, Echo Cardiogram, Swan Ganz Monitoring, and Central Venous Pressures.
IX. Therapeutic Intervention	IX. Intervention to Improve Outcomes	IX. Intervention to Decrease the Incidence of Pulmonary Edema A. Profile and Identify patients at risk for developing pulmonary edema. B. Identify patterns of nursing or physician management that result in an increased risk of developing pulmonary edema. C. Decrease health care cost by taking preventative measures in high risk patients and improving nursing and/or physician management of these patients.

* As outlined in Degowen EL, Degowen RL. Bedside Diagnostic Examination. New York: Macmillan Publishing Co., Inc., 1976.

It is imperative that institutions develop objective tools to evaluate the structure, process, and outcome of healthcare. The use of implicit and explicit criteria in measuring the quality of care has been debated for more than a decade.[7-9] Donabedian believes that explicit criteria are predictable, consistent, and fair.[8,10] Optimally the clinician will view these tools as a logical and useful measurement of their management of disease. The focus review audit can be designed using explicit criteria and serve as a tool to evaluate the quality of healthcare.

Focus Review

The Joint Commission on Accreditation of Health Care Organizations (JCAHO) has devoted its resources to encouraging the "Monitoring and Evaluation of the Quality and Appropriateness of Care" in hospitals, hospital outpatient facilities, and health maintenance organizations (HMO).[11-16] The concept of the "focus review" can be used to fulfill the requirements of the JCAHO as well as federal and state quality assurance watchdogs. Focus reviews can identify problems, determine their causality, evaluate deficiencies in healthcare delivery and achievement of therapeutic outcomes, or validate suspected trends in practice. The task of the healthcare organization and provider is to review data, analyze trends, and develop a review methodology (focus review) to validate their perception of the problem and to determine actions to remedy the deficient practices. This review process also can be used to validate outcomes obtained from DRG data and as a management tool in granting hospital privileges.

We suggest the above process is analogous to the basic skills and logic required in physical diagnosis. Clinicians can use this approach to design a focus review to serve as a method of evaluation in the quality assurance of healthcare and as a research tool.

Medical students throughout the world learn their clinical skills in a physical diagnosis course. The focus review application to risk management, quality assurance, and utilization review is an extension of the principles learned by physicians early in their medical school education. The *Bedside Diagnostic Examination* by Elmer L. Degowen MD and Richard L. Degowen MD[17] will be used by the author to incorporate the principles of physical diagnosis in the construction of a focus review. The content of the focus review must be refined and adapted just as one would alter the approach taken in examining a schoolchild, athlete, or adult or when examining a patient with an upper respiratory infection, metastatic cancer, acute abdomen, or trauma. In designing a focus review the

physician must identify the objectives of the evaluation. As in physical diagnosis, the focus review should not be broad based but specific to a particular problem or area of concern. For example, the clinician would require explicit data when examining and evaluating the causality of different approaches and outcomes, surgical complications, efficiency of patient follow-up, validity of transfusion therapy, or the practice of diagnostic laboratory evaluation.

Role of Focus Review in Quality Management

Let us compare the basic concepts of physical diagnosis outlined by the Degowens[17] and the role of the focus review in Quality Management. These concepts may be used to design a sample review that also will fulfill the Ten-Step Monitoring and Evaluation Process proposed by the JCAHO.[6]

Degowen and Degowen define the search of clues in the diagnostic examination as the "random probing here and there with meticulous scrutiny, looking for diagnostic symptoms, signs, or laboratory findings."[17] Focus reviews are based on the random probing of a specific problem with a set of predetermined indicators. As with physical diagnosis, certain indicators will require the physician to design more specific profiles as the problem becomes more defined through the review. Using this technique in Quality Assurance may result in the establishment of a more finite list of indicators and thereby enable the clinician to clearly identify the problem and take appropriate effective action.

The "Certainty of the Diagnosis" section of Degowen and Degowen addresses the lack of an accepted scale of "degrees of certainty whereby the examiners can express the extent to which he had proved his diagnosis."[17] Terms such as preventive diagnosis, probable or working diagnosis are frequently used. The primary and secondary diagnosis also may differ depending on the physician examining the patient. Unfortunately, indicators will vary between specialties as will the priority of diagnosis. Quantification may indeed need to be specific to the specialty or subspecialty when designing the focus review. For example, an intraoperative bladder cystotomy during a cesarean section will be treated differently from the same complication during a tumor debulking procedure for ovarian carcinoma. The clinician must consider the patient population, the clinical setting, and the nature of the clinical specialty being examined when designing the focus review indicators.

The importance of statistics in physical diagnosis is not helpful if there is a bad outcome or a rare disease that affects only a few patients; examining trends or occurrences in mixed populations can be misleading.[17] This is important to remember when evaluating healthcare. For example, if the number of patients who fall in a particular unit is com-

Table 2. Problem: Increased incidence of patients discharged with a secondary diagnosis of pulmonary edema.

HYPOTHESIS:
1. Physical profile of a population at risk for pulmonary edema has not been identified.
2. The increased incidence as a comorbidity has extended (LOS) Length of Stay and cost of hospitalization.
3. The increased incidence is attributable to "speed shock" (Inappropriate Bolus of Fluid resulting in overload) or administration of incorrect intravenous fluid which increases the potential risk status of the hospital.
4. Inappropriate fluid management by medical staff is contributory to comorbidity.

METHOD: Use of matrix analysis to determine confounding variables and achieve multiple outputs.

parable to other units in the hospital, one tends to fail to identify falls as an area of concern. The focus review can be used to identify those patients at greatest risk and help to decrease the absolute number of patients who fall, thereby providing the specificity needed to uncover a true area of risk. Consider a department such as Obstetrics and Gynecology, with a very low overall rate of falls and resultant morbidity when compared to the hospital population. A focus review to evaluate patient falls can be designed to identify the subpopulation at risk. In the department of Obstetrics and Gynecology, the majority of patients are young, healthy females. A small subpopulation of patients in the Gynecologic Oncology Division, however, may be at an increased risk of falling attributable to a number of variables including analgesics, postoperative response to radical operative procedures, the effects of a chemotherapeutic regimen, malnutrition, and the impact of a progressive neoplastic disease.

Methodology

Focus review methodology is similar to the

> prerequisites for diagnostication...Acquisition from preclinical courses... acquisitions from clinical courses and exposure... and acquisitions of skills from practice."[17]

Although focus reviews designed by different clinicians may share many similarities, they are distinct in that they reflect the designers' clinical knowledge and experience. Therefore we strongly recommend that if a physician or nurse is designing a focus review, they incorporate input from other departmental resources and ancillary personnel to assure completeness of approach and to diminish the potential for skewed results.

The basic fundamentals taught medical students in a physical diagnosis course are used to design a focus review to evaluate pulmonary edema in Tables 1, 2. These indicators can be expanded to evaluate patients who have had pulmonary edema secondary to a myocardial infarction after admission. As in the example above, the indicators list can be made as finite as required for the subject being evaluated. This sample audit evaluates physician and nursing clinical practice as well as documentation practices. If required, additional focus reviews can be designed to comprehensively examine practice patterns.

In conclusion, the focus review is an old concept revisited. Its construction is similar to the approach taken in physical diagnosis that is familiar to all physicians and health care providers. As Quality Assurance is stressed by the JCAHO in their Agenda for Change, clinicians will be required to utilize Quality Management programs. Specialty organizations such at The American College of Obstetricians and Gynecologists[18] have stressed the importance of Quality Assurance, the use of clinical indicators and criteria statements. The focus review can be used to evaluate structure, process, and outcome. Although a simple tool, the focus review also can be used as a research method, a management tool, or an instrument to assist in evaluating cost/benefit analysis.

Case Report: Gamma-Globulin Treatment of Severe Varicella-Associated Thrombocytopenia

Harvey J. Steinfeld MD

Dr. Steinfeld is in private practice in Shady Side, MD.

Treatment of varicella-associated thrombocytopenic purpura has included platelet transfusions, prednisone, and more recently intravenous gamma globulin, whose efficacy in this condition is not widely appreciated.

Thrombocytopenia purpura has long been known to sometimes follow viral illness, such as varicella. We report the treatment of a case of severe post-varicella thrombocytopenia with intravenous gamma-globulin.

Case Report

A seven-year-old male developed typical chickenpox seven days before admission to the hospital. Two days before admission he sustained a fall from a skateboard that resulted in a bruise to his right side. His mother noted progression of the bruises following the fall. Past history had been unremarkable in all respects, and family history was negative for hematologic or collagen disease. Upon presentation to the office on the day of admission, exam showed widespread petechiae, scattered ecchymoses, and a ragged clot on the left buccal mucosa. Laboratory data showed a white count of 8.08 thousand with 73 percent segs, 20 percent lymphocytes, 4 atypical lymphocytes, 1 monocyte, 1 eosinophil, and 1 basophil. Hematocrit was 42.5 with normal indices, and platelet count was 1,000. Prothrombin time and PTT were normal, and there was gross hematuria.

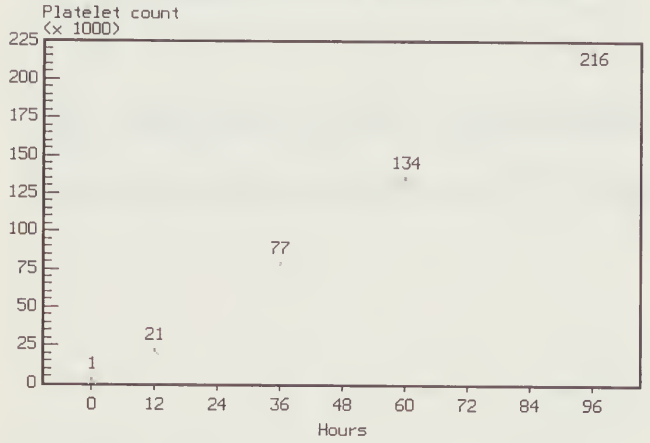
Treatment consisted of administration of seven (7) units of platelets and the administration of 20 grams of gamma globulin intravenously over four to six hours. Sequential platelet counts are noted in Figure 1. Hematuria had diminished to trace positive by dipstick by the fourth day of hospitalization, and there was no hematuria by the fifth day, the day of discharge. Weekly platelet counts were performed for six weeks as noted in Figure 2. There was no secondary fall in platelet count.

Discussion

Treatment of thrombocytopenic purpura has included platelet transfusions (the efficacy of which has been limited by the shortened survival time of platelets in this disease) prednisone, and more recently intravenous gamma globulin.

The first published report of the use of gamma globulin in the treatment of thrombocytopenic purpura appeared in 1981,[1] and

Figure 1. Platelet Count as a Function of Time



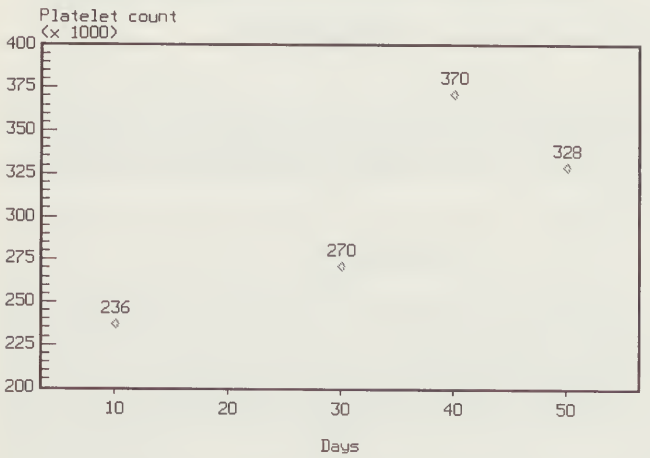


Figure 2. Platelet Count as a Function of Time

since that time multiple reports have documented the efficacy of this treatment. A detailed review by Bussel and Hilgartner of the use of intravenous immunoglobulin for this condition in childhood appeared in 1987, [2] and the reader is referred to this article for discussion of possible mechanisms of action of gamma globulin.

Gamma globulin was first reported as a treatment for varicella-associated thrombocytopenia by Dituro and associates in 1986.[3] Hara et al. also reported treatment of a single case.[4] We elected to administer a dose of one gram per kilogram body weight.

While the prognosis of thrombocytopenic purpura is usually favorable, deaths have been reported.[5-7] Children especially at risk may include those with widespread petechiae, mucosal hemorrhage, and hematuria.[2]

We wish to alert the practicing pediatrician to the usefulness of gamma globulin in post-varicella thrombocytopenia; its efficacy in this condition is not widely appreciated.

For AIDS Drug Information

Call 1-800-TRIALS-A

NIAID has established a toll-free number for quick access to current information on NIH-sponsored clinical trials for AIDs. One goal of the service is to enroll more blacks, Hispanics, and IVDAs in clinical trials. All calls and information are confidential. Mailed information will be sent in plain envelopes; the caller's name/address will be deleted from the system. Three trained health specialists [one Spanish-speaking] will answer calls Monday-Friday from 9 am to 7 pm EST.

Case Report: Radiologic Diagnosis of Intracranial and Intraspinal Subarachnoid Metastasis from a Malignant Spinal Cord Astrocytoma

Timothy J. Miller MD and Henry Wang MD

From the Neuroradiology Division of the Russell H. Morgan Department of Radiological Sciences, The Johns Hopkins Medical Institutions. Reprints: Henry Wang MD, Meyer 8-140, Johns Hopkins Hospital, 600 N. Wolfe St., Baltimore, MD 21205.

Both CT and MRI demonstrate well the aggressive nature of malignant astrocytoma of the spinal cord, a rare and highly lethal cancer.

Malignant astrocytomas (Kernohan grades III and IV) account for only 7.5 percent of intramedullary spinal cord gliomas. The median age at presentation is 14 years, and the male-to-female ratio is approximately equal. The median survival time from onset of symptoms until death is 11 months. Although metastasis from benign spinal cord astrocytoma (Kernohan grades I and II) is exceedingly rare, approximately 60 percent of patients with malignant spinal cord astrocytomas develop subarachnoid metastasis. This spread is due to invasion of the subarachnoid space by tumor with dissemination of cancer cells via the cerebrospinal fluid (CSF) to the leptomeninges.[1-3]

The present case demonstrates the myelographic, magnetic resonance imaging (MRI), and computed tomography (CT) findings of a malignant spinal cord astrocytoma with intracranial and intraspinal subarachnoid metastasis.

Case Report

A 9-year-old male presented with sudden onset of back pain, urinary retention, and lower extremity weakness. A complete myelogram using water-soluble nonionic contrast medium demonstrated an intramedullary spinal cord tumor at the T-6 to T-8 vertebral levels (Figure 1). The patient underwent open biopsy and partial resection of the lesion, and pathology showed grade III malignant astrocytoma. A postoperative MRI of the spine including a gadolinium-enhanced study demonstrated residual intramedullary cystic spinal cord tumor. An intravenous contrast-enhanced brain CT scan done four days after surgery was normal. The patient underwent radiation therapy to the thoracic spinal cord, and at the time of discharge from the hospital he had residual left lower extremity weakness and a T-8 level sensory deficit.

The CSF cytopathology examination done two months after presentation showed no malignant cells. The patient remained stable until 11 months after presentation when he developed rapid

onset of headache, nausea, and vomiting. A repeat brain CT with intravenous contrast showed intracranial enhancing metastases in the fourth ventricle and the right lateral ventricle (Figure 2). He underwent craniotomy with partial resection of the posterior fossa mass followed by chemotherapy and continued radiation therapy. Pathology of the fourth ventricle mass showed anaplastic astrocytoma identical to the previously resected spinal cord astrocytoma. CSF cytopathology done two weeks after craniotomy was again negative for malignant cells.

One month after craniotomy the patient complained of increased left leg weakness, and an IV-enhanced MRI scan of the spine demonstrated a new subarachnoid metastasis at the L-1 vertebral level (Figure 3).

Discussion

Since CSF cytology has a high incidence of false negatives, radiology plays a crucial role in the diagnosis of primary intraspinal malignant astrocytoma as well as of subarachnoid metastasis to the ventricles or spine.[1] This case demonstrates well the insensitivity of CSF cytopathology and the typical radiologic findings in malignant astrocytoma of the spinal cord.

The patient's myelogram demonstrated a complete block to myelographic contrast and fusiform enlargement of the spinal cord with thinning of the subarachnoid space typical of an intramedullary tumor. A concurrent brain CT scan with intravenous contrast was normal, ruling out primary or metastatic brain neoplasm. Postoperative MRI showed features characteristic of a high grade malignant neoplasm. As is typical in many neoplastic tissues, T-1 and T-2 relaxation times were both increased resulting in decreased T-1 signal and increased T-2 signal on spin echo sequences. Increased T-1 and T-2 relaxation times are due to an increase in free water content in neoplastic tissue as compared to normal tissue.

Figure 1. Myelogram (AP and lateral views of the thoracolumbar region) shows intramedullary tumor with complete block to myelographic contrast (arrow).

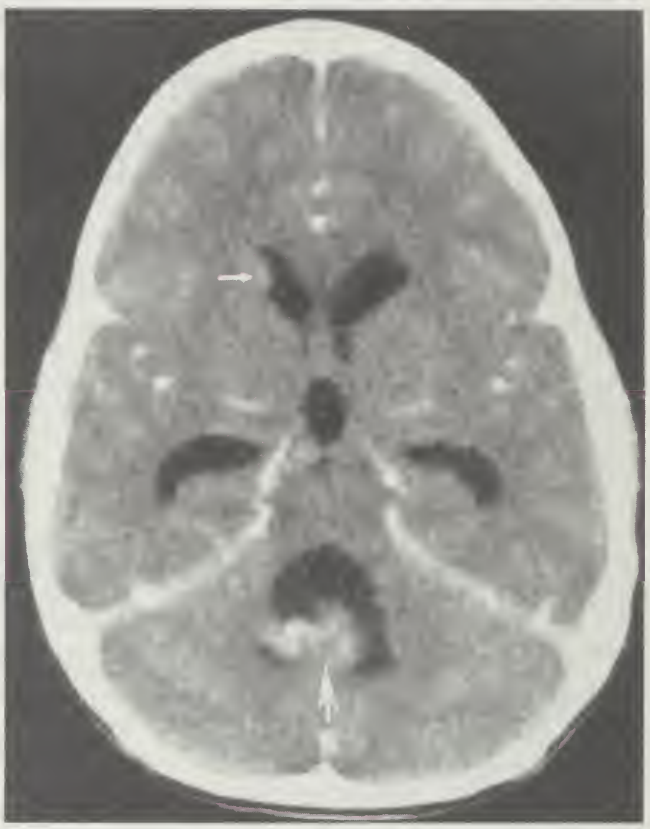

Figure 2. Enhanced brain CT after intravenous administration of diatrizoate meglumine 60 gram-percent shows CSF borne metastases in the fourth ventricle (large arrow) and right lateral ventricle (small arrow) with obstructive hydrocephalus.

Figure 3. Post Gd-DTPA T-1 weighted axial image (TR=600, TE=30) shows enhancing subarachnoid metastasis (arrow) at the L-1 vertebral level.

Intravenous administration of gadolinium diethylene triamine penta-acetic acid (Gd-DTPA, Magnevist) resulted in significant enhancement of the spinal cord tumor and of the spinal metastasis. As with CT contrast agents, the degree of enhancement with MRI Gd-DTPA reflects the grade of the malignancy. High grade cancers form neocapillaries that have fenestrations, and therefore the blood-brain barrier is incomplete, which allows intravenous contrast agents to accumulate in the region of the tumor.[4,5] Similar contrast enhancement of the intracranial metastases was seen on CT.

Opposite to its benign counterpart, malignant astrocytoma of the spinal cord has a strong predisposition to metastasize via the CSF.[2] As in this case, the spinal tumor may spread via the CSF to the intracranial ventricles and to other areas of the spine. Therefore, radiologic evaluation of the entire neural axis with gadolinium-enhanced MRI is recommended at the time of presentation as well as whenever any deterioration in clinical status occurs.

We have shown that both CT and MRI demonstrate well the aggressive nature of this rare and highly lethal cancer. However, since MRI is unhindered by bone artifact, it is superior to CT in evaluating the posterior fossa, brain stem, and spinal cord.

Case Report and Review of Literature: Hypernatremia in Breast-Fed Infants

Fred J. Heldrich MD and Sandy Sunghee Shaw MD

From the Department of Pediatrics, St. Agnes Hospital, Baltimore, where Dr. Heldrich is Chairman.

Hypernatremic dehydration in breast-fed infants is preventable, requiring adequate instruction of mothers prior to hospital discharge and close follow-up after leaving the hospital.

Breast-feeding of newborns is enjoying a resurgence and is strongly advocated as the best food source available for healthy, term neonates.[1] In making this statement one assumes the mother is healthy, is not taking foods or drugs that might be harmful to the infant when transmitted via breast milk, has been adequately advised about the technique of breast-feeding, and is given appropriate follow-up surveillance by a capable healthcare provider. Even then (as in circumstances noted in this report) there may be qualitative abnormalities in the breast milk that may affect the infant adversely, particularly if adequate postpartum care is not provided. Our experience with two patients who presented with hypernatremic dehydration plus a review of 14 other patients reported in the literature supports this contention.[2-10]

Case Reports

Patient 1 A 3.67 kg male had been delivered vaginally following an uncomplicated gestation. He was discharged at seven hours of age on breast feeding. The mother's health was good, and this had been her first pregnancy. She was taking no medications. There were no significant familial illnesses. At three days of age when seen for his metabolic screening, he weighed 3.34 kg, and was said to be nursing every 3 or 4 hours although he would occasionally refuse a feeding. From the ninth day, he fed only 2 or 3 times a day and began to sleep through the night except for occasional whining. He continued to urinate 5 to 6 times and pass 2 or 3 soft, brown stools every day.

The mother noted weight loss and called a representative from a breast-feeding advocacy group who assured her that "everything was fine." There was no vomiting, cough, respiratory complaint, or fever. On admission, he was 17 days old and was dehydrated and lethargic but irritable when aroused. Skin had loss of elasticity, the anterior fontanel and eyes were sunken, and he had poor skin turgor. Temperature 36.5° C, P 148/minute, R 44/minute BP 70/? mm Hg, wgt 2.67 Kg. Lungs were clear, and heart sounds were of good quality. The abdomen was scaphoid. Testes were descended bilaterally and he was uncircumcised.

Laboratory studies revealed sodium 171 mEq/L, chloride 131 mEq/L, potassium 4.1 mEq/L, CO_2 25 mmol/L, blood urea nitrogen 61 mg/dl, creatinine 1.5 mg/dl, serum glucose 83 mg/dl, calcium 12.1 mg/dl, and phosphorous 4.2 mg/dl. Hemoglobin was 16.4 gm/dl, hematocrit 49.7 percent, white blood cell count 12,900/cu mm, 24 percent polymorphonuclear leukocytes, 5 percent bands, 50 percent lymphocytes, 9 percent monocytes, 1 percent basophiles, and 1 percent eosinophiles. Liver function studies were within normal limits. Total protein was 6.8 gm/dl. The cerebrospinal fluid (CSF) contained no cells and was sterile. A blood culture showed no growth. The urine had a specific gravity of 1.020, contained white blood cells too numerous to count and yielded over 100,000 colonies of *Escherichia coli* per cu mm. An intravenous pyelogram and voiding cystourethrogram were normal.

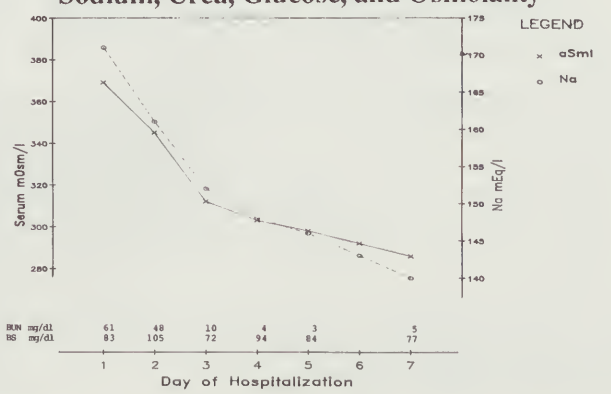
Therapy was begun with ampicillin and gentamicin and rehydration was accomplished slowly using a solution containing 0.2 percent NaCl in 5 percent glucose. Clinically, the patient responded well. Analysis of the mother's breast milk revealed a sodium concentration of 61 mEq/L, but her supply was abundant. Three days later, the sodium content was 11 mEq/L, and the patient resumed breast-feeding. He was discharged in good health on the seventh hospital day, weighing 3.16 Kg. Initial laboratory findings and response to therapy are shown in Figure 1.

Patient 2 A 15-day-old female was admitted to the emergency room hypothermic, cyanotic, and dehydrated. She had been delivered vaginally following a normal gestation, weighing 3.12 kg. Family history was not significant. The mother's health had been good, and she was taking no medications. The infant was discharged on breast-feedings. The parents had planned to have the infant seen in two weeks by a physician who had not seen her during the hospital stay. The infant nursed every 3 to 4 hours, and the mother felt she had an adequate supply of breast milk. There was no evidence of mastitis. There was no history of vomiting, diarrhea, or polyuria. The mother was unaware of any difficulty, and felt she had a "good baby."

Twenty-four hours prior to admission the infant was noted to be lethargic and sucked poorly. Urine output was diminished. Stools had been occurring 3 or 4 times per day, but she had had none in the prior 24 hours. On presentation to the emergency room, she was cyanotic. Her pulse of 118 was thready, respirations 18/min, and temperature 36° C, BP 54/30 mm Hg, and weight 2.1 kg. Dehydration was assessed as 15 percent and fluid resuscitation was accomplished with Ringer's lactate solution, resulting in improvement in clinical status. Specimens for cultures of blood, urine, and CSF were obtained. Serum electrolytes revealed: sodium 208 mEq/L, potassium 7.7 mEq/L, chloride 163 mEq/L, CO_2 26 mmol/L, blood urea nitrogen 298 mg/dl, creatinine 7.8 mg/dl, glucose 278 mg/dl, calcium 10 mg/dl. Hemoglobin was 16.8 gm/dl, hematocrit 51.4 percent, platelets 52,000/cu mm, and white blood cell count 17,000/cu mm, polymorphonuclears 39 percent, bands 1 percent, lymphocytes 53 percent, monocytes 4 percent. CSF revealed 4 red blood cells, 22 white blood cells, protein 119 mg/dl, and glucose 260 mg/dl. Urine specific gravity was 1.035. Serum ammonia was normal. Blood culture was positive for *Bacteroides fragilis*. Cultures of CSF and urine showed no growth.

Ampicillin and cefotaxime were begun intravenously and continued for seven days. Repeat blood cultures were negative. Rehydration with slow correction of hypernatremia using a solution containing 0.2 percent NaCl in 5 percent glucose was accomplished with serum sodium returning to normal on the fifth day. Intravenous insulin, 0.5 U/kg, was given twice on day two to lower the blood glucose, which had risen to 666 mg/dl. Blood sugar normalized by day six, creatinine by day seven, and urea nitrogen by day ten. Clinical course was complicated by seizures that began on day one, but they were controlled with diazepam and diphenylhydantoin. Serum calcium remained in normal range. Computerized tomography of the head was normal x 2. A repeat examination of CSF verified the absence of subarachnoid bleeding. A renal sonogram was normal. Sclerema was noted on day three but resolved by day seven. The patient's lethargy gradually improved, and at discharge on day eleven, she was taking 3 to 4 ounces every four hours of a 20 calorie per ounce formula with no other medication. Initial

Figure 1: Patient 1 - Determination of Serum Sodium, Urea, Glucose, and Osmolality



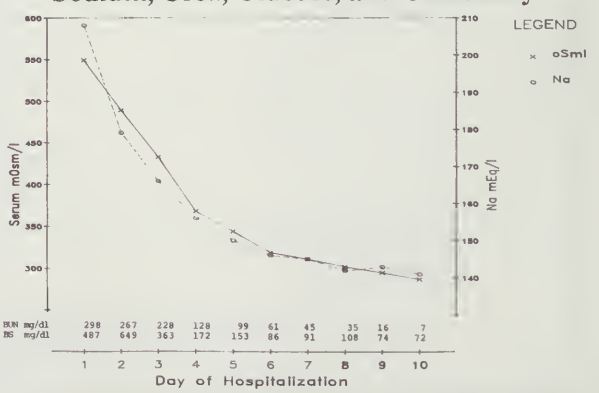


Figure 2: Patient 2 - Determination of Serum Sodium, Urea, Glucose, and Osmolality

laboratory findings and response to therapy are shown in Figure 2.

A sample of the mother's breast milk obtained on day one contained 88 mEq sodium/L. A sample on day seven contained 18 mEq of sodium/L. The infant's state of malnutrition and dehydration was attributed to an inadequate intake of breast milk that contained an excessive sodium content.

Discussion

Until the cause of hypernatremia in our patients was determined, it was necessary to consider multiple potential etiologies. Table 1 summarizes these etiolotic categories.

Errors in formula preparation in a hospital setting,[11] the incorrect dilution of concentrated formula, or the use of boiled skimmed milk have all been known to result in hypernatremia in infants. Breast milk also may contain an excessive level of sodium. An increase in water loss may occur secondary to high ambient temperatures, especially in very small preterm infants. Excessive water loss has been reported in neonates with congenital lamellar ichthyosis.[12] Renal tubular acidosis and diabetes insipidus, either central or renal, may lead to an excessive water loss.[13] Hypernatremia in a neonate has been reported as a result of watery diarrhea due to glucose-galactose intolerance.[14] Infectious diarrhea also may result in hypernatremic dehydration.

While the high concentration of sodium in the breast milk of the mothers provided an explanation for the patients' hypernatremia, the reason for the elevated breast milk sodium was not apparent.

Studies of the electrolyte composition of breast milk in lactating mothers following delivery have shown a mean sodium value of 64.8, ±4.4 mEq/L following delivery, dropping to a mean of 21.4, ±2.3 mEq/L by the third postpartum day. By two weeks, the sodium level in breast milk is 7, ±2 mEq/L. Under normal circumstances, the high sodium content in breast milk for the first few days of the puerperium does not lead to hypernatremia in the infant and may be a defense mechanism during a period of relative thirst and dehydration.[15,16] However, continued intake of feedings with a high sodium content may lead to hypernatremia.

Mastitis has been associated with a high sodium concentration in breast milk, and it has been speculated that mucoviscidosis in the mother may also be a cause. In most instances, the cause remains unknown. None of the recognized causes were present in either mother. Both mothers continued to express milk via a breast pump. In the mother of patient 1, the breast milk sodium returned to normal in three days (postpartum day 20). In the mother of patient 2, the breast milk sodium was 18 mEq/L on the postpartum day 22 and of small volume. Breast-feeding was resumed in the first patient, but formula was substituted in patient 2. Perhaps the inadequate supply of breast milk in the mother of patient 2 contributed to the elevated sodium.

Hypernatremic dehydration in breast-fed infants should be considered preventable. Prevention requires:

1. Awareness of the possibility
2. Adequate instruction prior to discharge and follow-up care
3. Appreciation of signs and symptoms of feeding difficulties.

Reported instances of hypernatremia in breast-fed infants should alert health care providers to this possibility even though it occurs infrequently. Inability of the parents to recognize signs of illness in their infant was a significant factor in patient 2. Insistence on breast feeding at all costs may have led to the advice and false reassurance given the mother of patient 1. Inadequate follow-up was a contributing factor in both patients. Whatever the reason, the importance of maintaining close contact with newborns after discharge from the hospital is supported by these two cases.

Literature Review

A review of 16 reported cases of hypernatremic dehydration in breast-fed infants reveals that certain signs and symptoms occur with significant regularity (Table 2). Twelve of the 16 infants were firstborns, suggesting that a lack of previous experience with breast-feeding may lead to an inability to recognize poor feeding. However, 14 of 16 mothers did indicate that the infant was feeding poorly and was excessively sleepy or lethargic. Despite this, only 2 of the 14 indicated they had sought advice prior to admission. One of the patient's parents had been reassured by a family

Table 1. Differential Diagnosis of Hypernatremia in Neonates: General Etiologic Categories

Excessive sodium intake
Improper formula preparation
Saline enemas
Breast milk
Excessive water loss

Gastrointestinal

Table 2. Signs and Symptoms in 16 Breast-Fed Hypernatremic Neonates

Symptoms	Number
1st child	12
Lethargy	14
Poor feeding	14
Oliguria	7
Signs	
Degydrated	16
Emaciated	16
Temp $\leq$ 36° C	7

member, another by a representative of the La Leche League.

In no instance was vomiting or diarrhea noted, and the reduction in urination, although reported by 7 of the 16 mothers, was not noted until 24 hours prior to admission by 4 of the 7 mothers. This is perhaps best explained by noting that extravascular volume is maintained in hypertonic dehydration, allowing glomerular filtration and urine production to continue longer despite the loss of total body fluid.

On examination, evidence of dehydration and emaciation was apparent in all patients. In 7 of the 10 patients with a recorded temperature on admission, hypothermia was present. Significant laboratory findings are summarized in Table 3.

The birthweight of the infants ranged from 2.04 to 4.11 kg (average 3.23 kg). There was a weight loss of from 600 to 1420 gm (average 988 gm). The percentage of weight loss was 24-37 percent (average 30 percent). Undoubtedly, this weight loss was attributable to loss of lean body mass secondary to caloric deprivation as well as water deficit.

Three of the 16 patient reports reviewed revealed an infection: *Staphylococcus aureus* paronychia (1), *E. coli* urinary tract infection (1) and *Bacteroides fragilis* septicemia (1). In none did the infection appear to cause the hypernatremia. Six patients had seizures during the course of treatment. All sixteen patients recovered without sequelae.

The current policy of early discharge of mother and infant, usually before the infant is 48 hours old, limits the period for observation of neonatal behavior and maternal-infant interaction and emphasizes the need of close physician contact during the neonatal period after discharge from the hospital. Situations that frequently require the infant to return are metabolic testing, assessment of hyperbilirubinemia, and as these case reports emphasize, a need to ascertain the adequacy of breast-feeding.

The most reliable preventive measures are undoubtedly the instructions given the mother prior to discharge and the surveillance supplied within the first week of discharge. Proper instruction includes a discussion of breast-feeding techniques, the usual time required to breast-feed and frequency of breast-feeding, the normal response of an infant when hungry, stool and urine patterns, and the assurance that any concerns about feeding should generate a phone call to the physician. Breast-fed infants are best seen at one week of age to insure adequacy of feeding. Adherence to such a policy should eliminate the problem of hypernatremic dehydration in breast-fed neonates.

Table 3. Significant Laboratory Measurements on Admission in 16 Breast-Fed Hypernatremic Neonates

	Patients Abnormal	Range	Average
Serum Na (mEq/L)	16/16	164-208	185
BUN (mg/dl)	16/16	47-298	143
Serum glucose (mg/dl)	4/11	36-336	163
Serum Cr (mEq/L)	12/12	1.0-7.8	3
Serum (OSml)	11/11	367-537	426
Breast Na (mEq/L)	10/10	31-104	58

Update on Medical Control in EMS Service

Cardiac Rescue Technicians and Emergency Medical Technician-Paramedics throughout Maryland follow statewide medical protocols in the performance of their duties. These protocols are developed by the Maryland Institute for Emergency Medical Services Systems (MIEMSS) in conjunction with the statewide EMS community and are given final approval by the Board of Physician Quality Assurance, which certifies CRTs and EMT-Ps in a fashion similar to the licensing of physicians.

Prehospital advanced life support care in Maryland involves both "standing orders" and on-line medical direction. Revised protocols became effective January 1, 1990. Copies of the protocols are available in hospital emergency departments and hospital libraries in the state, as well as through the MIEMSS regional EMS offices and from the Office of the State EMS Director.

We want to bring to the attention of the medical community in Maryland new and specific language that clarifies medical control in the "field":

> *Once an EMS unit is on the scene, medical control is provided by a physician through the established EMS consultation system, by a physician who is part of the jurisdictional EMS program, or by the patient's identified private physician who is physically on location and willing to accompany the patient to the hospital. It is important that an atmosphere of courtesy and respect is established between EMS providers and physicians on the scene. Physicians should respect the professionalism of the EMS provider and provide assistance within the above guidelines.*

While many practicing physicians throughout the state are not directly involved in emergency care, it is helpful for all physicians to have a better understanding of emergency medical care in the event that a physician is on the scene of an emergency.

AMEEN I. RAMZY MD, FACS
State EMS Director

■ ■ ■

Update on the Board of Physician Quality Assurance

The Maryland Board of Physician Quality Assurance came into existence in the summer of 1988. It combines the duties of the previous Board of Medical Examiners and the former Commission on Medical Discipline. The Board consists of 15 members, 11 of whom are physicians. They meet semimonthly and the average meeting lasts about five hours. The Board's function is to protect the health and safety of the citizens of the State of Maryland. Besides physicians and osteopaths, the Board regulates eight other groups directly: psychiatric assistants, cardiac rescue technicians, aviation trauma technicians, emergency medical technicians (paramedics), acupuncturists, respiratory care practitioners, medical radiation technologists, and physician assistants.

The Board also regulates three groups in conjunction with the Nursing Board: nurse practitioners, nurse anesthetists, and nurse midwives.

The Board is consumer oriented and will let no complaint, regardless of how minor, go unanswered. The Board is backed by staff who have proved exemplary in their work and have left little room for compromise. The State Division of Management Analysis reviewed the Board structure, and much of this article is taken from their report.

In spite of the usual start-up difficulties associated with any large association, a remarkable amount has been accomplished. It was estimated that approximately 800 cases would be reviewed for 1989, which is almost a quarter increase over the previous committee's workload for 1988. In comparison, there were only 400 cases in 1984. This increase is attributed to the better collection of complaints from various sources, including the required reports from all healthcare arbitrations and medical insurance data. It is estimated that there will be 1,200 cases to review in 1990. The Board has a sincere desire to close all cases within one year and the power to reprimand, suspend, or revoke a license.

The Board is not a stand-alone operation but works together with the Attorney General's Office, the Department of Health and Mental Hygiene Hearing Office, and the Medical Chirurgical Faculty of the State of Maryland (Med Chi).

The Board receives about 60 cases a year that are "top priority." For the first nine months of 1989, 24 cases were referred to the Attorney General for prosecution, 15 cases were charged, and 21 hearings were held. There were 7 cases of emergency suspension. It takes the Attorney General's Office about 50 hours to prepare a fraudulent prescription writing case, about 165 hours to prepare an incompetency case, and about 280 hours for a sexual misconduct case.

Here are samples taken from actual cases illustrating the type of problems the Board has evaluated:

- A physician has been charged with unlawful prescription writing, a case involving drugs for sex.
- A physician prescribes medication without the proper work-up.
- Excessive prescribing of controlled drugs for pain management.
- The DEA has revoked the physician's permit to dispense drugs. Should his license be withdrawn?
- Physicians with psychiatric or chemical dependency problems.

- A physician prescribing drugs to known addicts.
- A physician carries out a vaginal exam in a sexually inactive young patient and makes no office record.
- A physician with multiple malpractice claims (as many as 10 in another state) has successfully completed a probation period and now applies for a Maryland license.
- A physician fails to carry out proper radiation doses and hospital privileges are suspended. Should the physician's license be suspended until further training?
- Professional incompetence with loss of hospital privileges. Should license be revoked?
- A House Officer dismissed before his training period expired is now applying for his license.
- What to do with complaints from patients that the physician performed unnecessary lab tests or gave unnecessary and expensive treatment.
- A foreign physician applies for license and there is no way to confirm his completion of medical school or hospital training.
- Several cases against physicians who allegedly grossly overcharge insurance companies.
- Practice of a type of Psychology (Jungean Therapy) without a medical license.
- Medicare and/or Medicaid fraud is a criminal offense. Should a license be suspended or revoked?
- A counseling center charges as if a psychiatrist was present when in fact a psychiatrist no longer supervises the clinic.
- What to do with complaints from patients that the physician performed unnecessary lab tests or gave unnecessary and expensive treatments.
- A physician supervises an acupuncturist by phone only.
- An unorthodox office practice with religious suggestions and/or machines such as ultrasound used for therapy.
- Complaints from one physician that a second physician is treating cancer incorrectly.
- A complaint by a patient's daughter that her elderly mother died of incorrect medication from her physician.
- How to handle problems of bad recordkeeping in hospitals or offices when medical care is satisfactory.
- A physician refuses to allow the State Laboratories Administration to inspect his office laboratory or talk to his lab personnel.
- How to handle physicians who have bad hospital manners but are not medically incompetent.
- What to do with physicians who are employed by HMOs and are therefore limited in their ability to use laboratories and diagnostic tools and consultations that they themselves feel are necessary.

Complaints considered of a minor nature, although a standard may have been violated, make up 55 percent of all new cases. These most frequently are resolved after investigation with a letter of education to the physician and a letter to the consumer explaining that the Board has formally addressed the matter.

As one looks back over the opening year, there is a sense that the job is being carried out with dedication and a feeling of accomplishment.

BERNARD S. KLEIMAN MD

Council - January 18, 1990
381st Meeting

Minutes The Council minutes of November 16, 1989 were approved as submitted.

Committee Reports

Finance Committee Dr. Jose Yosuico, Chairman and Treasurer, introduced a slide presentation, developed by the staff, to enlighten Council of the vast amount of work the staff accomplishes and how the staff is organized.

Dr. Yosuico submitted the Proposed 1990 Budget for approval. Dr. Yosuico pointed out that for the first time the Budget was zero based and contained cost centers. Dr. Yosuico acknowledged the members of the Finance Committee and thanked them for their efforts. Dr. Snyder asked if there would be a dues increase for 1990 to which Dr. Yosuico promptly answered that there would not be a dues increase. Following a brief discussion, the Proposed 1990 Budget was approved as submitted. Dr. Nagel also expressed his thanks for the Committee's hard work.

Committee on Professional Ethics The Committee provided a report regarding the status of the Oregon Medical Association (OMA) and their position relative to the "Death with Dignity Act." As directed by Council at its meeting of November 16, 1989, staff had contacted the Oregon State Medical Society (OMS) and learned that the OMS is not supporting the "Death with Dignity Act" in that state. They have accepted the position of the AMA; that is, physicians should not participate in assisting in the demise of individuals.

Legislative Committee Dr. Susan R. Guarnieri, Chairman, was present to submit the two Committee reports, which were approved, and commented on the Legislative Committee's activities and positive participation. Mr. Gerry Evans presented information on the topics of Mandated Medicare Assignment, Physician Ownership, Health Service Cost Review Commission (HSCRC), and DEA numbers.

Mr. Evans stated that mandated Medicare assignment would be a big hurdle to overcome in Annapolis this year (election year for representatives). Although no bills have been filed, various drafts of a mandated assignment bill have been circulating. Mr. Evans requested that the Council reaffirm its position against mandated assignment by participating in a physician rally in Annapolis scheduled on February 21, 1990. Council approved participation and committed the Faculty to provide whatever was necessary: mailings, transportation, etc. to assure the success of this event.

AMA Interim Meeting A preliminary summary of actions taken by the AMA during its meeting of December 1989 was submitted to Council for its information. The report contained highlights of the AMA House of Delegates deliberations and results of Maryland Resolutions. A complete, formal report will be submitted in the near future. Dr. George S. Malouf, Sr., motioned to support the candidates for positions within the AMA. These candidates were Dr. Ted Lewers for the Board of Trustees, Dr. Henry Wagner for the Council on Scientific Affairs, Dr. Roland Smoot for the AMPAC Board, and Dr. Michael Dobridge for the Council on Long Range Planning and Development. The motion was seconded and adopted. Dr. Lewers thanked the Council for their support and indicated that the action taken to endorse him was gratefully appreciated and would allow him to begin planning with other states to insure that his running for the Board in 2 or 3 years would be the most opportune time, considering competition from other delegations for the same seat.

Committee on Hospital Medical Staffs An updated report of the joint venture between the Maryland Hospital Association and Med Chi (Professional Credentialing Records Service, Inc.) was submitted for Council's approval. The report summarized actions agreed on by both parties during recent discussions. Topics reported on included incorporation of the entity, criteria for the Board of Directors, resources of funding, location of the corporation, software to be used, administrative support, and confidentiality policies. Recommendations on these subjects were approved as submitted. Following this discussion, Dr. Paul Stagg moved and it was seconded for the following six individuals to be members of the newly formed Board of Directors.

Joseph S. Fastow MD
Calvert County - Calvert Memorial Hospital
Leslie R. Miles MD
Allegany County - Sacred Heart Hospital
Marvin Schneider MD
Montgomery County - Holy Cross Hospital
Joseph I. Berman MD
Baltimore City - Columbia/FreeState
Robert J. Mahon MD
Baltimore County - St. Joseph Hospital
Paul A. Stagg MD
Dorchester County - Eastern Shore Hospital Center

Following some discussion, Dr. Bob moved the deletion of Dr. Mahon and the addition of Dr. Ghiladi to that position. Following additional discussion, there was a motion to table this action until the next Council meeting. The motion was seconded and approved.

Emeritus Membership Council approved the following physicians for Emeritus Membership in the Faculty as requested by the component society indicated:

Anne Arundel County
Richard K. Greenbank, *Annapolis*

Ernesto A. Tolentino, *Glen Burnie*

Baltimore City

Morton D. Berkow, *Baltimore*
John T. Johnson, *Baltimore*
H. Joseph Roebber, *Baltimore*

Carroll County

A. Sani Okutman, *Sykesville*

Cecil County

Roy W. Chestnut, Jr., *Baltimore*
Luis M. Cuza, *North East*
John A. Fischer, *Elkton*
Zin U. Park, *St. Augustine, FL*
Christobal Vela, *Elkton*

Montgomery County

Peter P. Andrews, *Bethesda*
Michael M. Healy, *Bethesda*

Affiliate Member

John C. Harvey, *Bethesda*

These names will be presented to the House of Delegates for consideration at its 1990 Annual Session.

Dues Waiver Council approved the following physician for a dues waiver as requested by the indicated component society:

Baltimore City
Patricia A. McIntyre, *Baltimore*

1990 Maryland Health Convocation Upon the recommendation of the Executive Committee, the Council approved the support of the tenth Annual Health Convocation with a contribution of $2,500. After further discussion, it was the consensus of the Council that Med Chi's involvement in the 1990 Convocation could be the concluding involvement in the ten-year history of the Convocation.

Committee on Drugs Staff gave a brief verbal report regarding the importance for physicians to communicate the dangers of the inappropriate use of drugs to their patients and presented a resolution for the Council's consideration. Following discussion and motions for amendment, the amended resolution was adopted as follows:

> RESOLVED, That the Medical and Chirurgical Faculty of Maryland urge all member physicians to inform all patients of the grave consequences of inappropriate drug use; and further, be it
> RESOLVED, That the Medical and Chirurgical Faculty of Maryland urge all physicians to post information on drug abuse in their examination and/or waiting rooms for the information of their patients.

This resolution will be forwarded to the Public Relations Committee for appropriate dissemination.

Prince George's County Medical Society The Prince George's County Medical Society presented a resolution for consideration of Council with the following resolves:

> RESOLVED, That as a measure of good will to all Medicare beneficiaries in Maryland, the Medical and Chirurgical Faculty of Maryland supports the principle of voluntary acceptance of Medicare assignment for any patient who so requests; and
> RESOLVED, That the Medical and Chirurgical Faculty of Maryland urge all of its members to accept all Medicare claims on assignment for any Medicare beneficiary requesting such acceptance.

Discussion on this subject brought to light that this resolution was similar in nature to Med Chi's current policy that physicians should be sensitive to the financial status of all patients including Medicare patients as well as concern about proper health care for all patients. The Prince George's County Medical Society's submission was not adopted. ■

1989 Interim Meeting of the AMA House of Delegates

The AMA House of Delegates met in Honolulu, December 3-6, 1989. This was a very busy meeting, with 187 resolutions and 79 Board and Council reports to consider. The House took positions on some far-reaching issues of vital importance to the practicing physician.

There were 435 delegates seated. The House composition is:

- 347 delegates representing state medical associations
- 78 delegates representing national medical specialty societies
- 10 delegates representing medical students, resident physicians, hospital medical staffs, young physicians, Army, Navy, Air Force, USPHS, and the Veterans Administration

Address of the President Alan R. Nelson, MD, AMA President, declaring that "the AMA works" cited an impressive list of accomplishments as an answer to the proverbial question, "What does the AMA do for me?" He included:

- the defeat of mandatory assignment four times in the past three Congresses
- the fact that the AMA is the world's largest publisher of scientific information
- the defeat of expenditure targets in the budget bill
- the AMA's commitment to NIH funding to protect the stability and integrity of medical research in the U.S.
- the AMA's considerable activities in communicating medicine's story to the public
- weekly news releases to 3,000 reporters
- meeting with editorial boards
- American Medical Television reaches over 50,000 physicians and 800,000 lay people each month
- American Medical Radio News is used by 500 radio stations daily

Dr. Nelson urged the nation's physicians to get involved and join the AMA as "your best investment in the future." He expressed concern that "the frustration and disillusionment being expressed by physicians in America will lead them to throw up their hands in despair rather than raise up their arms in support."

Lauro F. Cavazos PhD, US Secretary of Education Dr. Cavazos addressed the opening session of the House of Delegates. A former medical school dean, Dr. Cavazos declared that "our medical schools are at the forefront of curricular innovation and continue to attract the finest students." He credited the AMA as playing "an essential role in assuring that educational quality is maintained."

Dr. Cavazos called on the delegates for assistance in improving and restructuring our nation's system of education. He said, "without a well-educated citizenry, the United States is in danger of becoming what has been described as the world's only fully industrialized third-world nation."

Dr. Cavazos called for major restructuring of the nation's educational system that provided:

- early childhood education
- safe, drug free schools for all of America's children
- support for teachers from physician volunteers

AIDS The House approved a major policy update on the medical, legal, and social implications of AIDS and HIV infection. The Board report addressed a number of issues related to education, research, national policy, financing media coverage, and the prevalence and incidence of AIDS:

- recommended contact-tracing and notification of needle partners.
- recommended that the AMA Council on Medical Service study the cost of care for patients in each stage of HIV infection and estimate the number of people in each stage now and in five years.
- pledged ongoing support for funding for research, education, and patient care, as well as for alternatives to inpatient care.
- vowed to work with other physician groups, public health officials, and universities to advance training for primary care MDs and specialists.
- encouraged MDs to provide information to patients about HIV prevention and to become more involved in the care of HIV-infected patients.
- endorsed institutional indemnification of medical students and resident physicians infected as a result of patient contact.
- said AMA would consult with appropriate federal agencies and drug manufacturers about the expansion of AIDS drugs.
- urged MDs to take comprehensive and thorough sex and drug histories in a nonjudgmental fashion.
- asked federal and state agencies to establish rigorous proficiency testing and quality control procedures for testing labs frequently and regularly.
- reaffirmed its commitment to mandatory testing of inmates in federal and state prisons and supported mandatory testing of all newborns in high prevalence areas.

In other AIDS-related actions, the House:

- encouraged state legislation to establish requirements for reporting and case follow-up for serious contagious disease, including HIV infection.
- requested that the Food and Drug Administra-

tion address the problem of readable instructions for condoms.

- recommended that the FDA not allow home test kits for HIV.

Drug Abuse in the United States The House considered a Board report and several resolutions related to drug abuse. The report states that America's drug epidemic has evolved in recent years from an urban plight to a national crisis. The Board pledged its continuing involvement in programs to alert physicians and the public to the dimensions of the problem and the most promising solutions. The report recommended that the AMA:

1. Cooperate in activities of organizations such as the National Association for Perinatal Addiction Research and Education (NAPARE) in fostering education, research, prevention, and treatment of maternal drug and alcohol use.
2. Encourage the development of model alcohol and drug treatment programs, complete with an evaluation component, that are designed to meet the special needs of pregnant women through a comprehensive array of essential services.
3. Urge physicians to routinely screen all pregnant women and those of childbearing age for drug and alcohol use, and to follow-up positive screens with appropriate interventions and referrals.
4. Pursue the development of educational materials for physicians and the public on prevention, diagnosis, and treatment of perinatal addiction. In this regard, the Board encourages further collaboration with the Partnership for a Drug-free America in delivering appropriate messages to health professionals and the public on the risks and ramifications of perinatal drug and alcohol use.
5. Urge the National Institute on Drug Abuse, the National Institute on Alcohol Abuse and Alcoholism, and the Federal Office for Substance Abuse Prevention to continue to support research and intervention strategies.
6. Urge that public policy be predicated on the understanding that alcoholism and drug dependence are diseases characterized by compulsive use in the face of adverse consequences.
7. Affirm the concept that substance abuse is a disease and develop model legislation to appropriately address perinatal addiction as a disease, bearing in mind physicians' concern for the health of the mother, the fetus, and resultant offspring.
8. Call for better coordination of research, prevention, and intervention services for women and infants at risk for both HIV infection and perinatal addiction.

In a related action, the House adopted a resolution entitled "Substance Abuse as a Public Health Hazard," that called upon the AMA to:

- recognize that substance abuse is the major health problem in the United States today and that its solution requires a multifaceted approach.
- declare substance abuse its number one public health priority.
- take a positive stance as a leader in matters concerning substance abuse.
- study innovative approaches to the elimination of substance abuse dependencies and their resultant street crime, including approaches which have been used in other nations.

Prevention of Drunk Driving The House adopted a resolution introduced by the Young Physicians Section that addressed the issue of the involvement of alcohol as a leading cause of morbidity and mortality in motor vehicle accidents. The House voted to:

- encourage state medical societies to urge their state legislators to adopt a blood alcohol level of 0.05 percent as per se illegal for driving.
- work with Congress to make federal highway funds to states contingent upon state adoption of a blood alcohol level of 0.05 percent as per se illegal for driving.

Frozen Pre-embryos The House approved a report that discusses the legal and ethical issues created by the freezing of human pre-embryos and offers guidelines as to the rights of the gamete providers and the disposition of the pre-embryos.

ABMS Yellow Page Listing The House adopted a resolution introduced by the District of Columbia Delegation that called upon the AMA to:

- urge the American Board of Medical Specialties (ABMS) to abandon the entreprenеurial endeavor of placing display advertisements in the major Yellow Pages telephone directories where board certified specialists are located.
- insist that truth in advertising demands that ABMS state to all callers that their display listings may not represent a complete listing of all board certified specialists.

Health Insurance Coverage for Uninsured The House adopted a resolution that addressed the problem of having an estimated 37 million Americans without health insurance. Introduced by the American Academy of Family Physicians, the resolution called upon the AMA to reaffirm its support for ensuring access to health care for the uninsured:

- through a combination of employer-sponsored coverage.
- other private approaches such as risk pools and the AMA proposed restructuring of Medicaid and Medicare programs.

Dependent Uninsured Coverage In a related action, the House approved a resolution, introduced by the Hospital Medical Staff Section, calling for an AMA study of the health insurance coverage for the uninsured "dependent" population.

Billing for Cross-coverage A number of resolutions

addressed physician dissatisfaction with the referral of Medicare, Medicaid, and most private payors to allow solo practitioners to bill for services provided by covering physicians.

The House approved a policy calling on the AMA:

> to pursue all appropriate legislative, regulatory, and administrative means to amend or eliminate the inappropriate enforcement of the Social Security Act and/or Medicare regulations in order to make it possible for physicians in solo or group practice to bill and receive payment for professional services to their Medicare patients rendered by colleagues who provide them with traditional short-term coverage.

Funding for the AMA's Physicians' Assistance Program Several state delegations cosponsored a resolution asking the AMA to continue to adequately fund and maintain an impaired physicians program or "Physicians' Assistance Program." The resolution which was adopted as amended directed that the charge of the program will include, but not be limited to:

- promoting state medical society impaired physician programs and medical student impairment programs.
- providing technical assistance to state programs.
- conducting scientific and socioeconomic research.
- hosting an annual conference to share research and exchange ideas on the field of physician impairment.

Resolutions Submitted by Maryland Delegation

Gun Control Resolution #34

RESOLVED, That the American Medical Association use its influence in matters of health to effect passage of legislation in the Congress of the United States mandating a national waiting period that allows for a police background and positive identification check for anyone who wants to purchase a handgun from a gun dealer in our country.

House Action: Adopted, as amended.

Use of Insecticides - Resolution #35

RESOLVED, That the American Medical Association, at once and with the greatest vigor, bring before the members of the Congress of the United States our urgent request to curb the inappropriate and unsafe use of insecticides, fungicides, and other chemicals used to improve or alter the growth of fruits and vegetables; and be it further

RESOLVED, That the safety of these and any other chemicals used in the future be proved before they may be introduced into the food chain.

House Action: The House adopted the Reference Committee's recommendation that Resolution 101, "Effects of Pesticides," be adopted in lieu of Resolution 35. Resolution 101 asks that the AMA urge Congress, the EPA, and other responsible state and federal regulatory agencies to determine the effects of pesticides on humans.

Resolution #36 - Support for Improvement of the Health Environment in Developing Countries

RESOLVED, That the American Medical Association take all possible action to:

1. Encourage Congress to express a strong and clear commitment to continue the promotion of measures to improve child survival and development through long-term health and environmental programs in the poor countries of the world; and
2. Promote in Congress the passage of legislation that will provide tax and other incentives so that American banks, the International Monetary Fund, and World Bank will remit national debts in developing countries on the condition that additional funds in local currency, equivalent to the payments required under current obligations will be allocated to continuing programs for the following activities:
   - Expansion of child survival and nutrition programs.
   - Development of primary health care infrastructure.
   - Initiation and expansion of control efforts against major endemic diseases such as malaria, leprosy, tuberculosis, childhood pneumonia and other infectious diseases.
   - Improvement of environmental conditions to enhance the quality of life and protect local ecology in developing countries where massive environmental deterioration is having both local and worldwide impact.

House Action: This resolution was not adopted, but was referred to the AMA Board of Trustees for action.

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

One Minute With Diabetes

Oral Hygiene and Diabetes

Doctor, although I have not been to this office for a checkup on my diabetes for over a year I have been feeling well and have continued the same insulin routine: 40 units NPH before breakfast and 18 units NPH before supper. I have been too busy to test my blood glucose regularly, but when I do test about once a month, the readings are usually around 200 mg/dl.

I have been seeing my dentist every two weeks for the past two months because of sore and bleeding gums. The dentist said he cannot help my mouth condition until my diabetes is under better control. I do not understand what the relationship is between my mouth problem and my diabetes when I feel OK, but I am here because I am tired of having a sore mouth and my girlfriend said I have bad breath.

The often-used dental statement "Look Ma, no cavities" really should be "Look Ma, no cavities and no gingivitis" if we want to give a good report when we return from a visit to our dentist.

Periodontal diseases (gum infections occurring around the teeth) play a major role in tooth loss. For diabetic patients periodontal disease may be a major complication. About 85 percent of all people over the age of 40 probably have some degree of periodontal disease ranging from mild gum inflammation to severe periodontal disease. Dental plaque, a sticky film containing millions of bacteria, plays a major role in the development of gingivitis and other periodontal diseases.

Periodontal disease is more frequent and severe in people with diabetes and tends to occur at an earlier age. Diabetes causes the blood vessels to thicken, slowing down the transport of oxygen and nutrients to the tissues and waste removal. In the mouth this lowers the resistance of the gums and bony tissues to infection. When diabetes is poorly controlled, high glucose levels in the mouth fluids encourage the growth of harmful bacteria and set the stage for gingival infection, the first stage of periodontal disease.

Poor brushing and flossing habits allow plaque to accumulate of the teeth. Signs of gingivitis are redness and swelling of the gum tissue around teeth. The gums may be very tender and sensitive. Upon brushing the teeth some bleeding often occurs. Untreated gingivitis may progress to destructive periodontitis. Over time, plaque may harden and extend from the gum line down along the tooth root. The gum gradually separates from the tooth forming pockets that can harbor infection that the toothbrush cannot remove. The pockets may fill with pus and cause bad breath, as your girlfriend has called to your attention. Finally, the tooth may loosen and be lost.

What can you do to halt this destructive process? As your dentist has suggested, infection cannot be overcome in the absence of good diabetic control. First you must monitor the blood glucose before each meal and at bedtime. Insulin and food adjustments will need to be made until all the blood glucose readings are in the range of 90 to 120 mg/dl and the glycohemoglobin is within normal limits.

Brushing and flossing of teeth must be done daily as prescribed by the dentist. Brushing is an important step in plaque removal. It should be done twice daily with a soft brush and not too vigorously. Use dental floss at least once every day to remove bacteria and plaque from between the teeth. It is a good practice to brush the upper surface of the tongue. Finish by rinsing the mouth well with water or a suitable mouthwash. People with diabetes should have a dental checkup at least every six months. It is good to have a diabetes evaluation just before each dental checkup so the dentist will have some knowledge of your status before he or she carries out any necessary dental treatment. As with all problems the physician, dentist, dietitian, and health educator should work as a team to insure the best possible care of the patient.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Adjuvant Therapy in Melanoma Part I: Background, Chemotherapy, Radiation, and Nonspecific Immunotherapy

The major prognostic factor in patients with cutaneous melanoma is the stage of the disease. Patients who develop regional lymph node metastases (stage II disease) have guarded prognosis. However, these patients constitute two separate groups: (1) Those who have no clinical enlarged or palpable regional lymph nodes and underwent elective regional lymphadenectomy and are found to have metastatic melanoma, have 30 to 60 percent five year survival. (2) Patients who present with clinically enlarged regional lymph nodes and underwent therapeutic lymph node dissection have poorer prognosis with a five year survival of 10 to 22 percent.[1-4] In addition, it seems that the number of the involved lymph nodes affects the outcome, and patients who have two or more involved lymph nodes have the poorest survival.[5] Furthermore, patients who develop systemic metastases (stage IV) have extremely poor survival. Again, patients with soft tissue metastases such as in the skin and subcutaneous tissues do live longer than those who have metastases to parenchymatous organs such as the lung, liver, or brain.[6]

Surgery remains the most effective therapeutic modality in this disease. Primary lesions as well as regional lymph node metastases are managed by surgical resection. Patients with limited distant metastases also are managed by surgical excision for palliation, creating a disease-free environment for at least a short time. Such an approach has been used because of a lack of other effective therapeutic modalities at this stage of the disease.

In an attempt to improve such poor survival rates, adjuvant therapy after potentially curative (and occasionally palliative) surgery has been tried.

Adjuvant Chemotherapy Chemotherapy with imidazole-carboxamide (DTIC) alone or in combination with cyclophosphamide showed no survival advantage over those treated by surgery only. Therefore, until some new effective drugs are available, there is no benefit from administering adjuvant chemotherapy.[7,8]

Adjuvant Radiation Therapy Similarly, adjuvant radiation therapy after lymph node dissection was not found to be beneficial.[9]

Immunotherapy In general, immunotherapy can be classified into active and passive, and each can be tumor specific or nonspecific. Active immunotherapy requires an immunocompetent body to respond to the vaccination, and it lasts longer than passive immunization. All types of immunotherapy must be administered in a disease-free environment when there is extremely low tumor load.

With regard to the melanoma, most of the patients with no widespread disease seem to be relatively immunocompetent. Decreased immunocompetence usually results from tumor load rather than from preexisting immune defects in the host.

Nonspecific Immunization By Bacterial Products

The use of nonspecific immune stimulants such as Bacillus Calmette-Guerin (BCG) and *Corynebacterium parvum* (*C. parvum*) constituted most of the adjuvant trials in melanoma for two reasons: to stimulate the immune defenses in the host; and to augment the presumably weak tumor antigens. The results of several clinical trials failed to show significant survival advantages in patients treated by such an approach compared to those treated by surgery only in stage I and II melanoma.[10-12] On the other hand, intralesional injection of BCG is very effective in controlling local recurrences and minimal satellitosis (stage III disease) locally without apparent effect on longevity.

The use of adjuvant chemoimmunotherapy in the form of DTIC, cyclophosphamide, and *C. parvum*,[8] or DTIC and BCG[13] showed no survival benefit.

Immunoreconstitution Levamisole, an antihelmenthic drug, which was found to reconstitute general immunity, also has been tried and failed.[14]

Passive Immunization Lawrence transfer factor, which is a dialyzed extract of sensitized lymphocytes, can enhance and transfer delayed hypersensitivity skin reaction in recipients. However, we must keep in mind that we cannot transfer total immunity, but such transfer has to be specific, that is, the donor lymphocytes must be sensitized to specific antigens to obtain specific transfer. Therefore, the clinical trials yielded conflicting results,[15,16] as the preparation of the transfer factor depends largely on the donor cells sensitization.

Immunomodulation Interferon was tried in patients with advanced disease with a response rate of about 20 percent, similar to DTIC. Such responses were seen with the high dose of interferon. This raises the question of whether such responses were due to immunomodulation or to cytotoxin effect as in chemotherapy.

These adjuvant studies, particularly those using bacterial products, suggest that nonspecific stimulation of the immune system is not a rewarding approach. This is because BCG and *C. parvum* immunotherapy did not achieve the effect of correcting abnormalities of the immune system. In reality, nonspecific systemic immunization with these agents not only did not increase the immune competence, but also it may have resulted in immune deviation that may have suppressed some aspects of the immune functions against the tumor.[17]

Legal and Ethical Concerns of Your Medical Practice

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state.

The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

■ ■ ■

Retention of Medical Records

Physicians should note that, under Maryland law (Section 4-305 of the Health-General Article of the Code), "except for a minor patient, unless a patient is notified, a physician, optometrist, podiatrist, or dentist may not destroy a medical record or laboratory or x-ray report about a patient for 5 years after the record or report is made."

> A physician, optometrist, podiatrist, or dentist may not destroy a medical record or laboratory or x-ray report about a *minor patient* until the patient attains the age of majority (18 years) plus 3 years or for 5 years after the record or report is made, whichever is later unless:
>
> 1) The parent or guardian of the minor patient is notified; or
> 2) If the medical care documented in the record was provided under Sections 20-102 (c) or 20-103 (c) of the Health-General article, the minor patient is notified (emphasis added).

This section means, therefore, that a physician must keep the patient's medical record for *at least* 5 years after it is made unless the patient is a minor. The statute prescribes the statutory minimum time those records must be kept. In addition to the minimum period designated in the statute, physicians are reminded that there are other important legal considerations necessitating a longer retention time:

1. **Statute of Limitations: Malpractice Claims** This period varies depending on the age of the patient. Section 5-109 of the Courts and Judicial Proceedings Article of the Code provides in pertinent part:

> An action for damages for an injury arising out of the rendering of or failure to render professional services by a health care provider shall be filed within the earlier of:
> (1) Five years of the time the injury was committed; or
> (2) Three years of the date the injury was discovered...

If the claimant was under the age of 11 years at the time the injury was committed, the time limitations prescribed above shall commence when the claimant reaches the age of 11 years. These provisions may not be applied to an action for damages for an injury:

> (i) To the reproductive system of the claimant; or
> (ii) Caused by a foreign object negligently left in the claimant's body.
>
> (2) In an action for damages for an injury described in (i) or (ii), if the claimant was under the age of 16 years at the time the injury was committed, the time limitations prescribed in sentence 1 shall commence when the claimant reaches the age of 16 years.

2. **Medical Records** Medicare regulations state that records pertaining to Medicare payments or services may be reviewed up to 6 years after a claim is filed.

3. **Worker's Compensation Records** Article 101, Section 40 (c) of the Insurance Code provides that the Insurance Commission may modify its award within five years following the *last payment* of compensation.

In lieu of the above sections, the Medical and Chirurgical Faculty recommends that in order for physicians to be fully protected they should maintain their patients' medical records indefinitely. Data storage facilities are available where, for a low fee, records may be stored and retrieved as necessary. Also, physicians often have records microfilmed or microfiched for a minimal charge.

This topic and many others pertaining to the medical record are contained in a book published by Med-Chi entitled, *The Office Medical Record - Ownership, Access, and Release.* The book, presented in a question-and-answer format, is free to members and can be purchased by nonmembers for a nominal fee. Also available is a pamphlet, *Your Patients' Medical Records - A Physician's Guide to Ownership, Access, and Release.* Inquiries about the book and pamphlet should be directed to Michelle Burke or Betsy Newman in the Communications Department.

GREGORY DON HALL PD, JD, LLM

Mr. Hall is associated with the law firm of Rifkin, Evans, Silver & Lamone, which represents the Medical and Chirurgical Faculty of Maryland. ■

MRI UPDATE

Figure 1

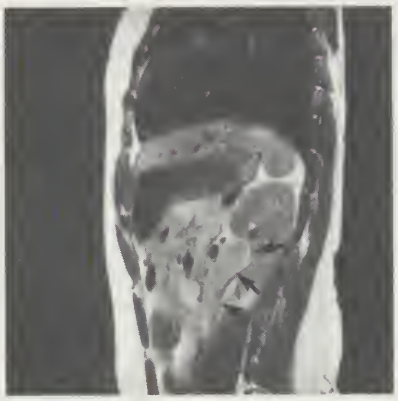

Figure 2

Figure 3

CLINICAL HISTORY: This is a 25-year-old female with complaints of left sided flank pain, nausea, and vomiting.

FINDINGS: Figure 1 represents a coronal T1-weighted image through the kidneys. A lobulated soft tissue mass conforming to the approximate shape of the left renal pelvis and the lower pole collecting system can be identified (large arrow). Signal intensity is intermediate and there is a central area of decreased signal intensity probably representing necrosis. Figure 2 is a sagittal image through the left kidney. In this projection, the soft tissue mass is comma shaped and can be identified extending from the left renal pelvis into the proximal left ureter (small arrows). Figure 3 is a T2-weighted image which exhibits increased signal intensity in the periphery of the mass and central decrcased signal intensity. A curvilinear low signal structure lies medial to the mass and is felt to represent the left renal vein displaced by the mass. The vein appears to be patent as evidenccd by the low signal intensity indicative of flowing blood (small arrows). No adenopathy is identified. There is no evidence of extension of the mass beyond the margins of the left renal pelvis or the proximal left ureter.

MR IMPRESSION: The location and shape of the soft tissue mass is typical for a transitional cell carcinoma.

MR NOTES: MR of the kidneys is a noninvasive procedure yielding both static and dynamic information about the pathologic process in question. In this case, the MR images defined the presence of the soft tissue mass in the left kidney, the confinement of the soft tissue mass to the left renal collecting system and the proximal left ureter, and the lack of invasion into the kidney and the adjacent pararenal soft tissue structures. In addition, the MR scan demonstrated that there is no evidence of thrombosis of the left renal vein nor is there evidence of tumor into the vein. MR imaging of the kidney is a noninvasive procedure allowing both anatomic identification of renal masses, staging of the extent of those renal masses, and determination of the presence or absence of renal vein involvement for surgical planning.

Sexual Aspects of Cardiovascular Disease. Chris Papadopoulos MD. Westport, CT: Praeger, Greenwood Press, 1989, 109pp.

This valuable new treatise (volume 10 in a series begun in 1984) is devoted to various aspects of Sexual Medicine and edited by Harold Lief MD of Philadelphia. Dr. Lief is an internationally recognized authority in psychiatry, a friend and colleague for many years, and Charter Fellow No. 86 of the American College of Psychoanalysts.

Physicians reading this work will recognize the tremendous significance of adequate and properly informed sexual counseling for their cardiovascular (CV) patients. Generally it is difficult (if not impossible) to accurately quantify emotional feelings and responses for patients with cardiovascular problems as well as other medical disorders.

As the author carefully points out, the quality of marital relations prior to an acute cardiac episode often directly influences the quality of relations achievable following this type of stressful medical event. Dr. Papadopoulos divides his data into eight major areas covering the gamut of his many years' experience as a cardiologist; he is currently Chief of Cardiology at Harbor Hospital Center. The initial area, which has slightly more coverage than his final discussion on sexual counseling and rehabilitation of the CV patient, is on coronary artery disease and sexuality.

The remaining six areas, covered more briefly but with equal care, concern the noncoronary cardiac patient, postcardiac surgery, aorto-iliac occlusive disease, the hypertensive patient, strokes, and cardiovascular drugs. Throughout, the author cites many statistical findings. While of great assistance to the clinician they also often point out rather sharply the relative paucity of clinical research, especially in numbers sufficient to better assist our understanding of what our patients might anticipate in this major aspect of their lives. It might be noted that while anecdotal (with subjects of novels and soap operas) accounts of cardiac death during sexual activity are encountered, actual documented cases are indeed sparse. In this connection added stresses such as travel, overeating, unfamiliar surroundings, illicitness, and fear of discovery can be contributory.

The discomfort and reluctance of many health professionals to discuss with their patients their sexual activities is understandable. Its ease is hardly enhanced by the patients similar emotional restrictions to discussion. It is unfortunate indeed when these kinds of barriers contribute to the subsequent crippling of sexual expression. To provide adequate and accurate counseling about sexual activity in the presence of any illness requires a substantial measure of personal comfort and confidence on the part of the counselor.

When CV accident or illness demonstrably restricts physical activity and exertion, similar restrictions on sexual activity are reasonable. However, as rehabilitative endeavors gradually restore general physical capability, a parallel restoration of sexual activity can well accompany physical improvement. It is regrettable when undue cautions and/or inadequate encouragement reenforces existing apprehensions of many patients about resuming their sexual lives following a CV accident.

In this easy-to-read, compact volume of Dr. Papadopoulos, the need for further clinical research with more significant numbers of persons becomes increasingly apparent. More guidance is properly afforded by the author to the physician and the health professional, rather than to the patient. One cannot stress too much the value of informed medical counseling and its lasting impact, either good or bad depending on its content and quality, on the patients and their spouses. This book is recommended reading for all health personnel who care for those with cardiovascular problems.

5. Am J Gastroenterol 1989;84:769-774.

AXID®
nizatidine capsules

Brief Summary. Consult the package literature for complete information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to eight weeks of treatment. Most patients heal within four weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than one year are not known.

Contraindication: Known hypersensitivity to the drug. Use with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events was due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to three times the upper limit of normal, however, did not significantly differ from that in placebo patients. Hepatitis and jaundice have been reported. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H_2-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H_2-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Because cross-sensitivity among this class has been observed, H_2-receptor antagonists should not be administered to those with a history of hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

In 1965, *Dr. Frank J. Ayd* asked a colleague what he thought of the idea of a monthly newsletter devoted to psychopharmacotherapy. Told it would fold within a year for want of reportable news, Ayd decided to launch his newsletter anyway. Now embarking on its 25th year, *International Drug Therapy Newsletter* is the oldest publication of its kind in the history of medicine.

Dr. Ayd, a founder and life fellow of the American College of Neuropsychopharmacology, conceived the idea when the breakthrough discoveries of the 1950s (the neuroleptics, MAOIs, tricyclics, and bensodiazepines) were still on the brink of wide clinical acceptance. Despite their established efficacy, the new treatments required skilled management, and Ayd saw a real physician need for guidance in the emerging art of drug therapy. Dr. Ayd admits his biggest challenge today is not a lack but an abundance of clinically important material.

John C. Barry MD, Glen Burnie, recently was inducted as a fellow of the American Academy of Orthopaedic Surgeons during the Academy's annual meeting in New Orleans. Dr. Barry was one of 577 new fellows inducted, bringing the Academy's membership to 15,052. The Academy is the largest medical association for musculoskeletal specialists. Its members have completed medical school plus up to five years of specialty study in orthopaedics in an accredited residency program, passed a comprehensive oral and written exam, and been certified by the American Board of Orthopaedic Surgery.

James P.G. Flynn MD, Towson, has been appointed director of the Maryland Institute for Emergency Medical Services Systems (MIEMSS), by the University of Maryland System Board of Regents. Dr. Flynn has been serving as acting director of MIEMSS since May 1989 when its founder, R Adams Cowley MD left to become director of the Charles McC. Mathias, Jr., National Study Center for Trauma and Emergency Medical Systems.

As director of MIEMSS, Flynn heads the state emergency medical services program and the R Adams Cowley Shock Trauma Center, which is part of the University of Maryland Medical System in Baltimore. During the term of his appointment, Flynn will work to enhance the clinical programs of the Institute and to stimulate the development of strong academic links with the school on the UMAB campus.

Dr. Flynn has served as director and chief executive officer of Montebello Rehabilitation Hospital, which, during his tenure, was transformed from a long-term, chronic care facility to a nationally recognized center for rehabilitative medicine. In addition, Dr. Flynn has served on the Boards of Directors of The American Lung Association, The American Heart Association (Maryland Affiliate and Central Maryland Chapter), American Cancer Society, and House of Ruth. He is an active member of the Maryland Thoracic Society, Maryland Helicopter Executive Advisory Committee, and the American Academy of Medical Directors.

Dr. Flynn received his medical degree from Trinity College, University of Dublin, and a master's degree in public health from The Johns Hopkins University School of Hygiene and Public Health.

■ ■ ■

Marcel E. Salive MD, MPH was elected to fellowship in the American College of Preventive Medicine. Dr. Salive has been active in the College's Prevention Policy Committee, Science Committee, and recently served on its Awards Committee. At the Prevention '90 meeting in April, Dr. Salive presented a paper, "Preventive Medicine Residents: A National Survey, 1988."

Dr. Salive is a medical officer in the U.S. Public Health Service stationed at the federal Agency for Health Care Policy and Research, where he coordinates medical effectiveness and patient outcomes research. He completed his residency training in preventive medicine at The Johns Hopkins University, where he retains an appointment as an Associate in the Department of Health Policy and Management.

Philip L. Schneider MD, Rockville, has written a chapter, "Spine Trauma," for the recently published textbook, *Orthopedic Injuries in the Elderly*. This 700-page text is the first major work dedicated to the treatment of geriatric injuries. ■

Doctors Receive Payment Today
For Patients Seen Yesterday
Only With
MEDical **PAY**ment
Services of Maryland, Inc.

BENEFITS

- **Increased net collections** as a result of systems developed over several years. Better secondary insurance handling, and improved follow-up result in increased and faster insurance payments.
- **Increased charges** as a result of experience in dealing with insurance companies to maximize reimbursed fees and with practices in looking for charges that can be overlooked or lost.
- **Faster utilization of funds.** Under the **MED PAY** plan, the large initial conversion advance and daily or weekly cash flow acceleration results in increased cash flow to the practice.
- **Realization of administrative savings** with **MED PAY's** handling of billing and collections.
- **Productive use of time.**
- **Practice growth.** The practice can increase billings faster if the capital required is available to employ additional professionals, purchase equipment, purchase facilities or invest in technology. The practice can also grow as a result of the consulting services, which are included.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

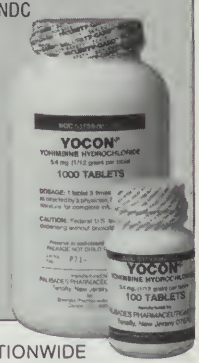
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

PHYSICIAN'S RECOGNITION AWARD PHYSICIAN'S RECOGNITION

During the months of November through January of 1989-1990, the following physicians received the AMA's Physician recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize physicians who have voluntarily completed programs of continuing medical education.

November 1989

Mercedita S. Conanan MD
Barney Davis MD
Michael R. Kuettel MD
Gary Wayne London MD
Arnold H Michael MD
Adel Nathan Mikhail MD

PHYSICIAN'S RECOGNITION AWARD

The American Medical Association understands how valuable your time is. We know there aren't enough hours in the day for doctors to do everything they want to do for their patients, community, family, friends, and themselves.

That's why we appreciate the efforts of many physicians to continue their medical education. These dedicated physicians find the time to expand their knowledge and improve their skills through continuing medical education.

In recognition of this continued achievement, the AMA is pleased to offer the *Physician's Recognition Award*. Displayed on the walls of your office or home, it is a symbol of your commitment to providing the best medical care possible.

You will be receiving an application for the *Physician's Recognition Award* in the mail shortly. We encourage you to participate in this program.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner

Call MSI to find out how we can help you

In the Matter of Mohammed Amirgholi MD Before the Maryland Board of Physician Quality Assurance

Final Decision

Procedural Background

On December 14, 1982 Mohammed Amirgholi MD (Respondent) entered into a Consent Order with the Commission on Medical Discipline in order to resolve charges pending against him issued by the Commission.[1] On February 2, 1988 the Commission charged Respondent with violation of Condition 4 of that Order. On February 2, 1988 the Commission charged Respondent with committing a prohibited act, §14-504(4).[2] On March 23, 1988, the Commission summarily suspended Respondent's license pursuant to State Government Article, §10-704. On March 23, 1988, the Commission charged Respondent with the following prohibited acts:

§14-504(3) - Is guilty of immoral conduct in the practice of medicine.[3]

§14-504(4) - Is professionally, physically or mentally incompetent.

§14-504(6) - Is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or proceeding is pending to have the conviction or plea set aside.[4]

§14-504(22) - Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section.[5]

A prehearing conference was held on January 23, 1989. At issue at the hearing were the §14-504 charges against Respondent, the charge of violation of probation and the summary suspension.

At the hearing, the following exhibits were introduced by Respondent's counsel and counsel for the state:

Joint Exhibits

Joint Exhibit 1. Stipulations of six pages.

Joint Exhibit 2. A list of the State's exhibits consisting of two pages to which the parties stipulated.

Joint Exhibit 3. A list of the Respondent's exhibits.

Hearing Officer's Exhibit

Hearing Officer Exhibit A. Prehearing Order.

State's Exhibits

State Exhibit 1. A copy of a letter from the Commission on Medical Discipline to the Respondent, dated October 20, 1982, notifying him of charges pending against him for violations of §14-504(4) and (6) of HOA, formerly Article 43, 130(h)(4) and §130(h) (18).

State Exhibit 2. A copy of the Findings of Fact, Conclusions of Law and Order, executed o December 14, 1982 between the Commission on Medical Discipline and the Respondent - seven pages to which the parties stipulated.

State Exhibit 3. The Violation of Probation issued by the Commission on Medical Discipline against the Respondent on February 2, 1988, alleging that he violated condition number (4) of the final Order on December 14, 1982 - five pages to which the parties stipulated.

State Exhibit 4. A copy of the *Charges Under the Medical Practice Act* issued by the Commission on Medical Discipline against the Respondent on February 2, 1988, alleging that he violated §14-504(4) of the Health Occupations Article, Annotated Code of Maryland, as then codified - ten pages to which the parties stipulated.

State Exhibit 5. A copy of the Peer Review report of the Medical and Chirurgical Faculty containing the following documents to which the parties stipulated.

a. The September 16, 1986 letter from Emidio A. Bianco MD, Chairman of the Peer Review Committee to the Commission recommending that the Respondent's medical license be revoked on the basis of medical incompetence.

b. The August 6, 1986 cover letter and report of James H. Heroy MD reviewing Respondent's records for 18 patients.

c. The July 17, 1986 letter from Emidio A. Bianco MD to the Commission.

d. The June 11, 1986 letter from Bruce B.K. Golden MD to Dr. Bianco.

e. A copy of the Report to Peer Review Committee of Med Chi of Patient Charts from Practice of [Respondent] issued by Pablo E. Dibos MD.

f. The first three (3) paragraphs of the June 27, 1985 letter from Emidio A. Bianco MD to the Commission regarding an evaluation of the Respondent's medical practice.

g. With transmittal from Dr. Bianco to Commission dated October 10, 1986, eighteen patient records of those patients whose records were reviewed by Dr. Dibos and Dr. Heroy.

1. The Commission on Medical Discipline (the Commission) was the state government agency empowered to sanction physicians. On July 1, 1988 the statute creating the Commission was repealed. The Board of Physician Quality Assurance (the Board) was created and all the powers of the Commission were transferred to the Board. Chapter 109, Acts 1988, Section 4 provided

> That the provisions of this Act do not apply to pending cases before the Commission on Medical Discipline or the Board of Medical Examiners in which a hearing has commenced or an order has been rendered as of the effective date of this Act.

2. §14-504(4) "Is professionally, physically, or mentally incompetent." Under the 1988 amendment this section became §14-504(a)(4). The language remained the same.

3. §14-504(3) was amended in 1988 and became 14-504(a)(3) "unprofessional" was included. This section now reads "Is guilty of immoral or unprofessional conduct in the practice of medicine." Respondent was not charged with "unprofessional" conduct in the practice of medicine.

4. The 1988 amendment deleted this section but added §14-504(b). §14-504(b) has kept the same language of S14-504(6) but requires the Board to automatically suspend and then revoke the physician's license.

5. Under the 1988 amendment, this became §14-504(a)(21) without language change.

State Exhibit 6. The March 23, 1988 Order for Emergency Suspension of the Medical License of the Respondent with attachments of Affidavit in Support of Arrest Warrant, Exhibit 6-1; Judgment and Commitment, Exhibit 6-2; Arrest Warrant, Exhibit 6-3; Application for Statement of Charges.

State Exhibit 7. A copy of Charges Under the Medical Practice Act issued by the Commission against Respondent on March 23, 1988, alleging violations of §§14-504(4), (3), (6), and (22) of the Health Occupations Article, Annotated Code of Maryland, as then codified.

State Exhibit 8. A copy of the STET issued in case number 644141E1, in the District Court of Maryland for Prince George's County, issued on June 9, 1988.

State Exhibit 9. The Curriculum Vitae for Pablo E. Dibos MD.

State Exhibit 10. The Curriculum Vitae for James Herold Heroy, III, MD.

State Exhibit 11. Copies of two patient records submitted by Dr. Heroy as examples of well-documented patient records.

State Exhibit 12. A copy of the testimony transcript in Criminal Action No. M7502-87 in the Superior Court of the District of Columbia, Criminal Division, dated December 7, 1987.

Respondent's Exhibits

Respondent Exhibit 1. A copy of the psychiatric evaluation performed by Jonas R. Rappeport MD on the Respondent, dated May 2, 1988.

Respondent Exhibit 2. A copy of the psychological evaluation performed by James E. Olsson PhD on Respondent, dated April 25, 1988.

Respondent Exhibit 3. A copy of a psychological report performed by Dr. Jean E. Robinson on Respondent, date May 4, 1988.

Respondent Exhibit 4. A copy of a letter from Dr. Jean Robinson to Ms. J. Hunter of the Superior Court of the District of Columbia, dated November 9, 1988.

Respondent Exhibit 5. The Curriculum Vitae of Jones R. Rappeport MD.

Respondent Exhibit 6. The Curriculum Vitae of James Eric Olsson PhD.

Respondent Exhibit 10. The psychological report of David P. Fago PhD regarding the Respondent, dated February 8, 1988.

Respondent Exhibit 11. A letter from David Fago PhD to Counsel for Respondent, dated November 22, 1988.

Respondent Exhibit 12. A May 4, 1988 letter written by the Respondent and forwarded to Counsel for Respondent by Dr. Jean E. Robinson.

Respondent Exhibit 13. A letter from a former patient of Respondent dated January 30, 1989.

Respondent Exhibit 14. A list of continuing education seminars attended by Respondent.

Respondent Exhibit 15. An Affidavit from a former patient of Respondent.

Respondent Exhibit 16. An affidavit from a former patient of Respondent.

Respondent Exhibit 17. An Affidavit from a former patient of Respondent.

Respondent Exhibit 18. A letter from Dr. M.S. Safavian regarding his familiarity with Respondent.

Respondent Exhibit 20. A copy of Respondent's medical license, renewed on October 14, 1986 and dated to expire on September 30, 1988.

Respondent Exhibit 21. The original file of Respondent regarding patient State Exhibit 5-1.

Respondent Exhibit 22. The original file of Respondent regarding patient State Exhibit 5-5.

Respondent Exhibit 23. The original file of Respondent regarding Patient State Exhibit 5-6.

Respondent Exhibit 24. The original file of Respondent regarding State Exhibit 5-3.

Witnesses for the State were: James Harold Heroy, III, MD and Pablo E. Dibos MD.

Witness for the Respondent was M.S. Safavian MD. By letter dated March 1, 1989, the Hearing Officer issued a proposed decision that included proposed Findings of Fact, proposed Conclusions of Law and Recommendations and a proposed Order. The Hearing Officer informed the parties of the date by which they had to file exceptions. On March 22, 1989, the State requested an extension of time in which to file exceptions. The State filed exceptions on April 13, 1989. The Respondent filed exceptions in response to the State's exceptions on April 21, 1989.

A hearing on the exceptions was scheduled before the Board on Wednesday, May 10, 1989. Respondent and the State waived the right to argue the exceptions. Respondent requested an opportunity to address the Board with an alternative proposal for settlement of this case.

The parties were apprised that the Board was not bound by the Hearing Officer's recommended conclusions of law and recommended sanction and that if the Board disagreed with the recommended conclusion of law and/or recommended sanction of the Hearing Officer, they would have ten days to file exceptions to any changes proposed by the Board.

By letter dated June 15, 1989, Respondent submitted a proposal for resolution of this case that, too, was considered but rejected by the Board. On December 12, 1989, the Board issued its proposed decision as voted on by the Board on May 10, 1989. By letter dated that day the parties were informed of their right to file additional exceptions since the sanction proposed was greater than the sanction proposed by the Hearing Officer. The Board informed the parties that any exceptions should be supported by transcript references. Exceptions were to be filed by December 22, 1989. The Board granted the parties an extension to filing exceptions. Respondent filed his exceptions on January 12, 1990 and the State filed responsive exceptions on January 22, 1990. The exceptions were express mailed to all Board members prior to the exceptions hearing. On January 24, 1990, the Board heard argument from the parties. By a majority vote of the full authorized membership of the Board, the Board voted as follows.

Findings of Fact

The Hearing Officer issued proposed Findings of Fact which commence on pages 16-37 of the Recommended Decision (RD). The Board has reviewed these findings of Fact, deleted what it considers legal conclusions, and added other findings from a review of the record. The additional findings of fact are not based on credibility findings, but on documentary evidence and a review of same. Where possible, the Board has noted the page references of the Hearing Officer's decision, exhibit references, and transcript references.[6] There were no exceptions to the Hearing Officer's Findings of Fact by either party.

The parties did not except to the Board's proposed findings of fact when they filed their exceptions in anticipation of the Board's final exception hearing on January 24, 1990.

1. Respondent was licensed to practice medicine in Maryland prior to October 30, 1980 and was practicing in Maryland at all times relevant to these proceedings. (Tr-283).

2. On October 30, 1980 Respondent pled guilty under *North Carolina v. Alford* to five counts of false pretenses in criminal court of Baltimore City, Case No. 18022702. Said charges were based on intentional submission of false invoices to the Maryland Medical Assistance Program (Stipulation #2).

3. On October 20, 1982 the Commission on Medical Discipline (the Commission) charged Respondent as being professionally incompetent, §14-504(4) and as being convicted of or pleads guilty or nolo contendere to a crime involving moral turpitude §14-504(6) (Stipulation #7 and State's Exhibit 1).

4. On December 14, 1982 Respondent entered into a Consent Order. Respondent was represented by an attorney. The Commission found that Respondent's medical practice from 1980 through the present continuously inadequate and below the average standard. The Commission found that committing the crime of false pretenses was a crime of moral turpitude. The Commission concluded Respondent had violated §§14-504(4) and (6) and found Respondent guilty of these charges. The Commission suspended Respondent's license, stayed the suspension placing Respondent on probation. The order allowed Respondent to petition the Commission for reinstatement in two years (Stipulation #8 and State's Exhibit 2).

5. On July 17, 1986 a Peer Review report reviewing Respondent's practice was issued by the Medical and Chirurgical Faculty of the State of Maryland (Stipulation #9).

6. On September 16, 1986 a review conducted by James H. Heroy MD was issued that supplemented the July 17, 1986 Peer Review (Stipulation #10).

7. On June 22, 1987 Respondent was charged with simple assault based on Affidavit in Support of Arrest Warrant in case #M7502-87, Criminal Division, Superior Court of the District of Columbia, *United States v. Amirgholi* (Stipulation #14, State Exhibit 6-1).

8. Respondent was only charged with simple assault in case #M750247-87. There is no evidence Respondent was charged with a sexual offense.[7]

9. The Complainant in #M750247-87 was Respondent's patient (State Exhibit 6-1, State Exhibit 12, pp. 4-37.

10. On September 23, 1987, an Application for Statement of Charges in case number 644141E1 was issued by the District Court for Prince George's County (Stipulation #11, State Exhibit 6-4).

11. On September 23, 1987, in case number 644141E1, in the District Court for Prince George's County, an Arrest Warrant was issued charging fourth degree sexual offense. (Stipulation #12, State Exhibit 6-3).

12. The complainant in case No. 644141E1 was a patient (State Exhibit 6-4, Respondent's Exhibit #2, p. 1).

13. The Complainant in case #M7502-87 testified that Respondent stuck his finger in her vagina while giving her an injection (State Exhibit 6-1, State Exhibit 12, pp. 8, 19, 20, 23, 24, 25, 27, 28).

14. Following a trial by jury and verdict of guilty, Respondent was convicted of simple assault in *USA v. Amirgholi*, Superior Court of D.C., Case No. M7502-87 (Stipulation #15, State's Exhibit 6-2, RD p. 16-17).

15. The simple assault of which Respondent was convicted was an assault on a patient by sticking his finger in her vagina. (State Exhibit #12).

16. On January 19, 1988 in case number M7502-87, in the Criminal Division, Superior Court of the District of Columbia, Respondent was sentenced to one year, all but 60 days suspended, $500 fine, and five years probation (Stipulation #16).

17. Beginning on January 19, 1988 Respondent served forty-five (45) days at the Lorton Reformatory in Fairfax, VA as a result of the conviction in Case #M7502-87 (Stipulation #17).

18. On February 2, 1988 the Commission charged Respondent with violation of probation, specifically, Condition 4 "That Respondent shall conduct his medical practice in a fully competent and adequate manner, and shall maintain his practice and in his medical documentation and recordkeeping procedures equivalent to those of the average competent practitioner" (Stipulation #18, State Exhibit 3).

6. Transcript of hearing on February 6, 1989 will be referenced as "T". Transcript of hearing on February 7, 1989 will be referenced as "Tr". The page reference will follow.

7. The Board accepts the Hearing Officer's Finding of Fact No. 7 on page 17 and No. 2 on page 18. The Board rejects Finding of Fact No. 3 as being incomplete and incorporates by reference the entire Affidavit in Support of Arrest, State Exhibit 6-1. The Board rejects Finding of Fact Nos. 4 and 5 on page 18 as interpretative of a document and not based on fact and notes that the jury found Respondent guilty as charged.

19. On February 2, 1988 the Commission charged Respondent with violation of §14-504(4) (Stipulation #19, State Exhibit 4).

20. On March 23, 1988 the Commission summarily suspended Respondent's license (Stipulation #20, State Exhibit 6, RD p. 16).

21. On March 23, 1988 the Commission charged Respondent with violations of §§14-504(3), (4), (6) and (22) (Stipulation #21, State Exhibit 7).

22. Jonas R. Rappeport MD is an expert in the area of psychiatry (Stipulation #22).

23. On May 2, 1988 Dr. Rappeport issued a psychiatric evaluation of Respondent (Stipulation #23).

24. Jean E. Robinson EdD is trained in the area of educational psychology (Stipulation #24).

25. Dr. Robinson treated and is presently treating Respondent (Stipulation #25).

26. On May 4, 1988 as treating psychologist for Respondent, Dr. Robinson wrote a letter including a confidential psychological report to David F. Fago PhD reporting Respondent's progress in therapy (Stipulation #26).

27. James E. Olsson PhD, is a clinical psychologist licensed in the State of Maryland (Stipulation #27).

28. On May 2, 1988 Dr. Olsson issued a confidential psychological report evaluating the Respondent (Stipulation #28).

29. David F. Fago PhD is a psychologist licensed in the State of Maryland and the District of Columbia specializing in family and adolescent psychology and forensic psychology (Stipulation #29).

30. On February 12, 1988 Dr. Fago issued a confidential psychological report evaluating the Respondent (Stipulation #30).

31. In Dr. Rappeport's report of May 2, 1988 Dr. Rappeport reported that Respondent, in discussing case number M7502-87 stated "I might have put my hand on her pubic area" (Respondent Exhibit 7, page 4).[8]

32. In Dr. Olsson's report of May 2, 1988 in discussing Case No. M7502-87 Dr. Olsson states:

> On the first case for which he had been convicted of simple assault in the Superior Court of the District of Columbia, Dr. Amirgholi admitted to touching the female patient inappropriately but stated "she encouraged me." He further stated "while I was doing acupressure, she moved liked she wanted me to continue to do it" (Respondent's Exhibit 2, p.1).

33. Respondent admitted that he kissed the complainant in case No. 644141E1 and that this behavior was inappropriate (Respondent Exhibit 1, p. 5).

34. Dr. Jean Robinson's report of May 4, 1988 stated that one of Respondent's goals was to continue in Dr. Fago's sex offenders group (Respondent Exhibit 3, p. 2). One of Respondent's goals was to participate in a support group for advocating women's rights, i.e., women sexually harassed or molested.

35. The psychiatric reports of David P. Fago PhD, of February 12, 1988 and February 22, 1988 were issued after the Summary Suspension of February 2, 1988 (Respondent Exhibits 10 and 11).

36. The evaluation by Dr. Jonas Rappeport dated May 2, 1988 was issued after the Summary Suspension (Respondent Exhibit 1).

37. The evaluation of James Olsson PhD dated May 2, 1988 was issued after the Summary Suspension (Respondent Exhibit 2).

38. The evaluations of Jean Robinson, PhD dated May 4, 1988 and November 9, 1988 were issued after the summary suspension (Respondent Exhibits 3 and 4).

39. The charges of Fourth Degree Sexual Offense in *State of Maryland v. Amirgholi*, District Court for Prince George's County, No. 644141E1 were issued September 23, 1987 (Stipulation 11, State Exhibit 6-3, 6-4).

40. A stet was entered in case No. 644141E1 on June 9, 1988 after the summary suspension has issued (Stipulation 13, Exhibit 8).[9]

41. With regard to the misconduct of which he was found guilty and that which was alleged, Dr. Rappeport states:

> I do not believe any indiscreet behavior with female patients would recur (Respondent Exhibit 1 p. 8).

42. Respondent Exhibit 2, a psychological evaluation of Respondent by James E. Olsson PhD, Clinical Psychologist, (see CV in Respondent Exhibit 6) on April 26, 1988 reports, in part:

> Although [Respondent] did not admit that he had a problem in relating sexually to his female patients, he stated generally that his life stresses, including a troubled marriage, may have made him behave in a self-destructive manner...
>
> [Respondent] has been in both individual and group therapy for the past month or so. According to his group therapist, Dr. David Fago, he is a quite active patient and is attempting to get something out of this therapy. [Respondent] showed some initial insight into his problems as he discussed his treatment with this examiner (Respondent Exhibit 2, p. 1).

43. A report of Respondent's progress in therapy written by Dr. Jean E. Robinson to David P. Fago PhD, dated May 4, 1988, states, in part:

> In his short time in therapy, I have seen enormous progress in [Respondent] ...
>
> [Respondent] presents as an emotionally insightful, philosophic, sensitive, and compassionate man ...
>
> It is my professional opinion (although I am not a forensic psychologist and defer to you in those matters) that [Respondent] is remorseful and amenable to rehabilitation (Respondent Exhibit 3, pp. 1 and 2).

44. Respondent Exhibit 10, a psychological report

8. As to Finding of Fact 7 on p. 19, the Board agrees that in Respondent's Exhibit 1, p. 4, the Respondent denied that he fingered the vagina; however, Respondent does admit that he may have put his hand on her pubic area.

9. As to Finding of Fact No. 6, RD at 19, the Board accepts that as to whether Respondent fondled the buttocks of a patient the steting of case No. 644141E1 together with the lack of any evidence on this fact results in there being no proof that Respondent fondled this person's buttocks. However, the evidence introduced by Respondent from the experts indicates inappropriate behavior with this patient as indicated in the order.

on Respondent prepared by David P. Fago PhD, Family and Adolescent Psychologist and Forensic Psychologist, on February 8, 1988 determined that group therapy with sex offenders and concurrent or subsequent marital therapy would be appropriate treatment of Respondent and that "it would seem appropriate that he be treated as a 'distressed physician' and be afforded the procedural treatment opportunities that the District and Maryland medical licensing boards ordinarily offer to such individuals" (Respondent Exhibit 10, pp. 4 and 5). His impression of Respondent, at the time of the evaluation (p. 4) was, in part:

> [Respondent] presents many of the typical features of a 'regressed' rather than 'fixated' or chronic sex offender, i.e., one who has committed sexual offenses in response to rather extreme emotional distress and his inability to maturely and effectively manage feelings of anger and frustration associated with this emotional and sexual rejection by his wife.... With proper supervision and outpatient treatment ... it does not appear that he would constitute a continuing danger to the community if he were permitted to treated (sic) outside an institutional setting.

45. On November 12, 1988 Dr. Fago wrote a letter confirming Respondent's participation in outpatient psychotherapy group and advised that Respondent continue (Stipulation #31).

46. On November 22, 1988, it was reported to counsel for Respondent by Dr. Fago that Respondent had participated in outpatient group psychotherapy with him between March 29 and October 10, 1988, but that he had briefly terminated treatment between October 10 and mid-November 1988 due to financial circumstances. It was also reported that the anticipated need for continued weekly group therapy for the Respondent was an additional 24 months (Respondent Exhibit 11).

47. Dr. Robinson stated "As you are well aware, it is impossible to predict the probability of improprieties in behavior occurring again. Therefore, it must be left up to the discretion of the medical board to determine what if any limitations need to be imposed on Dr. Amirgholi during his process of rehabilitation" (Respondent Exhibit 3, p. 2).

48. Dr. Fago diagnosed Respondent as having unclassified psychosexual disorder and recommended that Respondent receive 18 to 24 months psychotherapy (Respondent Exhibit 10, p. 3-4).

49. Dr. Fago saw Respondent between March 29 and October 10, 1988. Respondent stopped seeing Dr. Fago in November of 1988. Dr. Fago recommended he continue in treatment 24 months (Respondent Exhibit 11, RD p. 21, #11).

50. There is no evidence Respondent continued psychotherapy treatment.[10]

10. The Board rejects RD #12, p. 21, insofar as it states Dr. Fago states that Respondent presented no danger of recurrence. There is no reference for this statement. The Board rejects RD #13, p. 22. This is not a factual finding but a medical opinion for which there is no basis. Dr. Fago did not state there is "no danger" but that it does not appear that he would constitute a continuing danger.

51. On July 17, 1986, in a letter from Dr. Bianco, Chairman of the Med Chi Peer Review Committee to the Commission, it was recommended that Respondent's medical charts be reviewed by an Otolaryngologist who practices Allergy (RD #24, p. 26).

52. On August 6, 1986, James H. Heroy MD, a specialist in Otolaryngology, Head and Neck Surgery, and Allergy, forwarded a copy of his report on the charges of several of Respondent's patients to Dr. Bianco. That report, contained in State Exhibit 3, concludes, in part:

> In summary, I feel that this physician's treatment regimes in some areas are different than mine and in some cases I would definitely disagree or feel that he has omitted workups. Over (sic), however, it is extremely difficult to judge this individual's performances in view of the extremely spotty documentation of history, physical, diagnosis, and treatment in virtually every chart. Also, there seems to have been decisions made that are not placed on the chart (RD #25, pp. 26-27.

53. The standard of care with regard to patient records in the practice of Otolaryngology, Head and Neck Surgery and Allergy, requires the inclusion of a complete history of the illness (chief complaint), a past history of other conditions or medications pertaining to the patient, an environmental history with specific regard to the complaints from which the patient is suffering, a pertinent family history of allergies, and a record of the physical examination (looking for signs on the skin, mucous membranes, eyes, etc.).

The testimony of all physicians testifying at the hearing supported a finding that a patient chart, to be within the standard of care, must contain a complete history of the chief complaint (past history, family history, environmental history), and all pertinent findings of the physical examination to enable the physician to recall as much as possible about the patient.

Due to the often spurious positive or negative results of skin or RAST tests, test results should be used in the context of confirming or correlating to the history obtained by the physician during the examination (RD #26, p. 27).

54. There is clear and convincing evidence that Respondent's records are insufficient and do not meet the standard of care within the community.

Review of Respondent's patients' charts supports a finding that they do not reveal what took place between the physician and the patient. Information that may have been gathered by the physician was not written into the chart, and therefore it is not possible to uncover what information was given by the patients, what examinations were performed by the physician, or what the results of the examination were.

History and exam notes were very skimpy and did not impart a sufficient indication of the patients' histories or the findings resulting from the physical examinations.

The testimony of Dr. Heroy supported a finding that

the patient records for 14 patients were inadequate with regard to history:

> The testimony and written review of charts by Dr. Heroy support a finding that the treatment rendered to patients by Respondent breached the standard of care in the community by failure to document physical findings and justification for treatment.

55. Although Dr. Dibos does not practice within the same specialty as Respondent, his review of patient charts and this testimony support a finding that Respondent's treatment of several patients is outside the Respondent's area of expertise, his treatment of some patients is outside the standard of care in the practice of medicine, and his scant and incomplete recordkeeping for patient charts breaches the standard of care for the practice of medicine in the community.

Dr. Dibos is knowledgeable with regard to the standard of care in the practice of medicine in this community (RD #28, p. 33).

56. The testimony of Dr. Safavian, accepted as an expert of the specialty area of ENT, but not in the area of allergy, does not overcome a finding that Respondent's practice of ENT and Allergy is not within the standard of care.

Dr. Safavian, who admitted to not being at all familiar with practice of allergy, suggested that, in his opinion, the lack of recording negative findings in Respondent's charts is within the standard of care. However, he admitted that he is not familiar with the requirements of recordkeeping in the practice of allergy. He testified that the physician's records serve only to remind the physician regarding the problems and treatment of a patient. He stated that a proper history should include the complaint, the reason for the office visit, and a history of the complaint. He stated that the histories he reviewed in State Exhibit 5 were adequate with regard to notation of history and physical findings, although he noted that he did not review all of the patient files contained in State Exhibit 5.

Dr. Safavian suggested that the files he reviewed contained adequate histories, diagnoses, and treatment notations. He stated that Respondent's practice, to his estimation, was within the standard of care. He stated that the standard of care applicable to all physicians requires that a treatment plan should be written in the record, that all office visits should be noted even if the findings at that visit were all negative, that a diagnosis should be noted for every visit, and that if a diagnosis changes or is added, the record should be complete. He also stated that an environmental history should be included in a record when it is related to the complaint. He added that a family history is not significant in all events, and that a past history is not always important to include in the record. He stated, however, that the extent of the history depends on the complaint, i.e., if surgery is to be done, a complete history is necessary.

Dr. Safavian also suggested that although one of the records he reviewed did not have a treatment plan written in the record, this was not a significant deviation from the standard of care. He added that in training new physicians, more stringent demands are made on their recordkeeping to insure a higher standard in recordkeeping, but that the standard for review of records in an outpatient practice should be more relaxed.

Dr. Safavian noted certain components of recordkeeping were common to and required of all physicians, and these components were undisputedly missing from the records of Respondent: history, treatment plan, findings of office visits, test results, etc. (RD #29, p. 33-35).

58. Respondent's practice of medicine is below the minimum standard of care acceptable in the practice of medicine in this community (RD #30, p. 35).

59. By Consent Order dated December 14, 1985 Respondent agreed to certain terms and conditions of probation. (RD #31, p. 35).

60. The fourth term and condition of the Consent Order dated December 14, 1982 required:

> That Respondent shall at all times conduct his medical practice in a fully competent and adequate manner, and shall maintain in his practice and in his medical documentation and recordkeeping procedures, standards equivalent to those of the average competent practitioner of medicine (RD #32, p. 36).

61. The Consent Order dated December 14, 1982 provided that two years from the date of the Order, Respondent could petition the Commission for a termination of the probationary status and for full reinstatement of his license to practice medicine without any condition or restriction whatsoever (RD #33, p. 36).

62. The Respondent had not, as of the date of the issuance of the Violation of Probation allegations, petitioned for termination of the probationary status, and he was on probationary status subject to the terms and conditions set forth in the Consent Order dated December 14, 1982 (RD #34, p. 36).

63. By reports dated July 17, 1986 and September 16, 1986, the Peer Review Committee of the Medical and Chirurgical Faculty of the State of Maryland communicated to the Commission the results of the review of Respondent's medical practice, which reports demonstrated that Respondent was not competently and adequately practicing medicine and that he failed to demonstrate that he maintained, in his practice and his medical documentation and recordkeeping, procedures and standards equivalent to those of the average competent practitioner of medicine (RD #35, p. 36).

Conclusions of Law

By a majority vote of the full authorized membership of the Board considering this case, the Board concludes as follows:

Based on the foregoing Findings of Fact, it hereby concluded by preponderance of the evidence that

Respondent violated Condition 4 insofar as Respondent failed to:[11]

a) at all times conduct his medical practice in a fully competent and adequate manner; and

b) maintain in his practice and in his medical documentation and recordkeeping procedures, standards equivalent to those of the average competent practitioner of medicine.

And it is, by a majority vote of the full authorized membership of the Board considering this case, based on clear and convincing evidence, concluded as a matter of law that Respondent

Is guilty of immoral conduct in the practice of medicine HO §14-504(3).[12]

An it is, by a majority vote of the full authorized membership of the Board considering this case, based on clear and convincing evidence, concluded as a matter of law that Respondent

Is professionally, physically or mentally incompetent HO §14-504(4).

And it is, by a majority vote of the full authorized membership of the Board considering this case, based on clear and convincing evidence, concluded as a matter of law that Respondent

Is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside HO §14-504(6).[13]

And it is, by a majority vote of the full authorized membership of the Board considering this case, based on preponderance of evidence

That Respondent was an imminent danger to the public health safety and welfare of the citizens of Maryland.[14]

And it is, by a majority vote of the full authorized membership of the Board considering this case, that Respondent did not commit the prohibited act as set forth by HO §14-504(22)

Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section.[15]

Order

By a majority vote of the full authorized membership of the Board considering this case, based on Findings of Fact, and Conclusions of Law, it is this 5th day of February 1990

ORDERED that the charge against Respondent based on HO §14-504(22) is DISMISSED; and be it further

ORDERED that Respondent's license to practice medicine is REVOKED; and be it further

ORDERED that the Summary Suspension is VACATED; and be it further

ORDERED that this is a FINAL ORDER.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

11. The standard of proof necessary to prove a violation of probation is preponderance of evidence. *See Wink v. State*, 317 Md. 330, 563 A.2d 414 (1989).

12. The testimony in Criminal Action No. M7502-87 shows, at minimum, that Respondent assaulted a patient. As assault on a patient shocks the conscience of reasonable men and in the medical community is immoral behavior.

13. To be a crime of moral turpitude, the crime does not have to be a felony. It is conduct which is base or vile and contrary to the accepted and customary conduct between men. *Ricketts v. State*, 291 Md. 701 (1981); *Dental Examiners v. Lazzell*, 172 Md. 314 (1937). The circumstances of this case involve an assault against a patient, who was disrobed, and is based on case number M7502-87.

14. A hearing under State Government Article §10-404, is governed by the Administrative Procedure Article. The Administrative Procedure Article requires a preponderance of the evidence as the standard of proof. *Bernstein v. Real Estate Commission*, 221 Md. 221 (1959). Additionally, a summary suspension is analogous to an *ex parte* injunction. In Maryland when the moving party is the State in an injunction proceeding, the standard for granting an injunction is significantly lighter. All the state needs to show is that the conduct sought to be enjoined violates or is about to violate a law designed to protect the public health and welfare. *State Department of Health and Mental Hygiene v. Baltimore County*, 281 Md. 548 (1977). When the Commission determined to summarily suspend Respondent it not only knew Respondent was convicted of a crime, was charged with another but also that peer review had found his practice incompetent and that he was in violation of his probationary conditions.

15. Respondent was not given notice in the charging document of March 23, 1988 of the grounds for disciplinary action under §14-504 upon which this charge was based. Although it may be inferred that the grounds were §14-504(3) and (6), the Board believes under the Administrative Procedure Act, this is not sufficient notice.

In the Matter of
William Korman MD
Before the
Maryland Board of
Physician Quality Assurance

Tuesday
January 16, 1990

Charles G. Bernstein, Esquire
Suite 2852, World Trade Center
Baltimore, MD 21202
301-685-3400

RE: William Korman MD

Dear Mr. Bernstein:

At its meeting on Wednesday, January 10, 1990, the Board of Physician Quality Assurance (the Board) voted to accept the surrender of Dr. Korman's license as resolution of the Board's investigation against him, as follows.

As you are aware Section 14-503(a) of the Health Occupations Article, Annotated Code of Maryland (HO) states that unless the Board agrees to accept the surrender of a license, a licensed physician may not surrender the license while the licensee is under investigation. HO §14-503(b) permits the Board to set conditions on its agreement to accept surrender of the physician's license. While the Board accepts the conditions outlined in Dr. Korman's Letter of Surrender dated November 28, 1989, the Board will not accept this surrender unless it is considered a public document. Additionally the Board will not accept this surrender without making clear that in the event that Dr. Korman applies for reinstatement the Board is under no obligation to reinstate his license. In other words Dr. Korman is in the same status as one whose license has been revoked.

Finally, if the Board does entertain a petition for reinstatement of Dr. Korman's license, Dr. Korman would not only bear the burden of demonstrating that he is competent to practice medicine but also that he meets the other requirements for reinstatement of his license, i.e., is otherwise entitled to be licensed. HO 14-509.

Based on Dr. Korman's agreeing to the above additional conditions to the Letter of Surrender dated November 28, 1989 and the execution by Dr. Korman of this letter the Board will accept the surrender of Dr. Korman's license. Dr. Korman must return an executed copy of this original letter by March 1, 1990. The Board will then forward an executed acceptance of the letter of surrender to you. If Dr. Korman does not agree to these additional conditions the Board must proceed under HO §14-504(b).

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Agreement

I, William Korman MD, accept the above referenced additional conditions to my letter of surrender to the Board of Physician Quality Assurance dated November 28, 1989, in order that the Board agree to accept the surrender of my license in resolution of the investigation against me.

WILLIAM KORMAN MD

November 28, 1989

CERTIFIED MAIL

Israel H. Weiner MD, Chair, and
Board of Physician Quality Assurance Members
Department of Health and Mental Hygiene
P.O. Box 2571
Baltimore, MD 21215-0095

Dear Dr. Weiner and Board Members:

Please be advised that I have decided to surrender my Maryland license, which entitles me to practice medicine in the State of Maryland. I am not licensed in any other jurisdictions.

My decision to discontinue the practice of medicine has been prompted by an investigation of my practice by the Attorney General's Office and by my poor health. This investigation has resulted in my being charged criminally with Medicaid fraud in violation of Article 27, §230C and §230B(b)(1).

It is my desire to resolve this matter without formal action. In executing this letter of surrender of my license to practice medicine, I understand and agree that I can apply for reinstatement of my license in Maryland; however, if I apply for reinstatement of my license, I bear the burden of proving to the Board of Physician Quality Assurance (the Board) that I am competent to practice medicine. The Board may require that I take either the National Boards of the Flex Examinations or be evaluated by the McMasters program in Canada. I would bear the cost of any such evaluation. In other words, I must demonstrate that I have the cognitive and clinical competence to practice medicine.

I also agree that I will not attempt to obtain licensing in any other state or jurisdiction until such time as Maryland reinstates my license.

I understand that I may not give medical advice to any individual, for compensation or otherwise, and cannot prescribe medication. In other words, I understand that the surrender of my license means that I am in the same position as an unlicensed individual.

I understand that the Board will acknowledge to the Federation of State Medical Boards that I have surrendered my license. The Board will also acknowledge, for statistical purposes, without reference to my name , that as a result of the Commission's Order, a surrender of my license was obtained. I further understand that in the event that I would apply for reinstatement of my license in Maryland or apply to another state or country for a license to practice medicine, that this letter, and all underlying documents, may be released or published by the Board to the same extent as a final order under the Public Information Act.

However, if I comply with conditions below, the Board will accept this letter of surrender, and will take no further action against me. If an inquiry is made to the Board regarding the status of my license, the Board will state that I no longer have a license to practice medicine in Maryland.

Before the Board executes this letter as an acceptance of a resolution in this case, I understand that I must present now or shortly thereafter the following:

1. A copy of my letters to the Federal Drug Enforcement Administration (DEA) and the Maryland Division of Drug Control, surrendering my registration to prescribe controlled dangerous substances. Those letters have been sent certified, return receipt requested, and I have enclosed the respective registrations. I will present evidence of receipt by DEA and the Maryland Division of Drug Control when I receive it.

2. A copy of my letter to hospitals surrendering my privileges and resigning from the hospital staff. These letters have been sent certified, return receipt requested, and I will present evidence of receipt as soon as it is received. As to Sinai Hospital, please see Exhibits C-1 and C-2 noting my resignation from active staff.

3. I have destroyed all prescription pads bearing my name and all controlled dangerous substances remaining in my office were given to Erwin Hecker MD when I sold my practice to him. No prescription pads or controlled dangerous substances are within my custody, possession, or control.

4. A copy of the letter sent to my patients explaining that I am retiring from the practice of medicine and giving them the name of the physician to whom I am turning over my practice will be provided.

5. I also enclose the original of my license renewal issued by the Maryland State Board of Physician Quality Assurance.

Finally, I wish to make clear that I have consulted with an attorney before signing this letter surrendering my license to practice medicine in Maryland. I understand this letter of surrender fully. I make this decision freely and voluntarily.

WILLIAM KORMAN

On behalf of the Board of Physician Quality Assurance, on this 15th day of February, 1989 I accept William Korman's surrender of his license to practice medicine in Maryland.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

■ ■ ■

In the Matter of
Sang Kyun Shin MD
Before the
Maryland Board of
Physician Quality Assurance

Final Decision

Summary of Evidence,
Findings of Fact, Conclusions of Law

On November 21, 1988, the Maryland Board of Physician Quality Assurance (the Board) charged Sang Kyun Shin MD (Respondent), pursuant to §14-504, Health Occupations Article of the Annotated Code of Maryland (H). Respondent was charged as follows:

> Is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; HO §14-504(6)[1]
>
> Is . . . convicted . . . by a court of any state or country for an act

1. The 1988 General Assembly, by Senate Bill No. 508 and House Bill 855, merged the functions of the Commission on Medical Discipline and the Board of Medical Examiners into the Board of Physician Quality Assurance. The General Assembly also amended Health Occupations Article, §14-504 by repealing HO §14-504(6) and enacting HO §14-504(b). Section 14-504(b) *requires* the Board to suspend a license if the licensee is convicted of or pleads guilty or *nolo contendere* to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside. In addition, after the completion of the appellate process if the conviction has not been reversed or the plea has not been set side with respect to a crime of moral turpitude, the Board *shall order* the revocation of a license. Under this repeal and amendment, the grounds for discipline set forth in HO §14-504(6) remain the same, but the Board's discretion as to sanction is removed. Because the conviction or plea herein occurred prior to the effective date of the Act, the charge is issued under former HO §14-504(6), giving the Board discretion as to any sanction.

2. These charges are cited under the Act prior to amendment. The present parallel cites are HO §14-504(22) = HO §14-504(a)(21); HO §14-504(3) = HO §14-504(a)(3); HO §14-504(12) = HO §14-504(a)(11) The Board notes as cited §14-504(a)(3) includes "unprofessional" conduct. However, "unprofessional" was added to this section on July 1, 1988. This amendment occurred after the date of the facts at issue in this case. Therefore, Respondent cannot be charged with "unprofessional" conduct. The charge of "immoral conduct" stands.

that would be grounds for disciplinary action under this section; [HO §14-504(22)]

Grounds for disciplinary action under this section are:

Is guilty of immoral or unprofessional conduct in the practice of medicine; [HO §14-504(3)]

Willfully makes or files a false report or record in the practice of medicine; [HO §14-504(12) of the Act][2]

A hearing was scheduled before a Hearing Officer pursuant to HO §14-505 and commenced on July 7, 1989 and was continued on August 15, 1989.

Summary of Evidence

State Exhibit 1 - Letter to Dr. Shin dated November 21, 1988.

State Exhibit 2 - Charges issued November 21, 1988.

State Exhibit 3 - Summons and Notice of Charges and Hearing.

State Exhibit 4 - Certified copy of docket entries.

State Exhibit 5 - Criminal Information Number 28736403.

State Exhibit 6 - Statement of Facts. Respondent introduced the following exhibits 1-33, which were admitted into evidence, in part over objection by the Administrative Prosecutor:

The following documents were introduced into evidence without objection as Hearing Officer's exhibits:

Hearing Officer Exhibit 1 - Stipulation signed by Alice D. Ike, Esquire and Anton J.S. Keating, Esquire, six pages.

Hearing Officer Exhibit 2 - List of witnesses.

Ten persons testified for the Respondent.

On September 20, 1989, the Hearing Officer submitted the proposed Findings of Fact, Conclusions of Law, and Recommendations (Recommended Decision) to the Respondent and the State. Pursuant to State Government Article, §10-212, the parties were advised of their right to file exceptions and make oral argument on exceptions to the Board. By letter dated November 6, 1989 the Board notified the parties that it had received no exceptions and that the Board would consider the Recommended Decision at its November 22, 1989 meeting. The Board reviewed the Recommended Decision on November 22, 1989. The Board postponed consideration of the Recommended Decision until Wednesday, December 13, 1989. At that meeting, on an affirmative vote of a majority of its full authorized membership, the Board decided as follows and issued this Final Order and Decision.

Findings of Fact

The Board finds based on the testimony and exhibits introduced at the hearing, by clear and convincing evidence, that:

1. At all times relevant, Respondent was licensed to practice medicine in Maryland and was practicing as a pediatrician.

2. The Respondent pled guilty to Medicaid Fraud in violation of Article 27, §230C pursuant to Criminal Information #28736403 in *State of Maryland v. Sang Kyun Shin*, on December 30, 1987. On that date the Court's verdict was guilty on count 1 of the Criminal Information.

3. On December 30, 1987, Respondent was placed on two (2) years of supervised probation under Article 27, §641, received a fine of $10,000 and was ordered to pay restitution in the amount of $8,272.50 to the Department of Health and Mental Hygiene.

4. The time for filing an appeal to set aside Respondent's guilty plea and conviction has passed.

5. Respondent admitted to acts sufficient to support the plea accepted by the Criminal Court.

6. The Respondent was audited on his Medicaid billings by representatives of the Medicaid Fraud Unit. Twenty bills were found where the Respondent had not seen the patient on the particular occasion for which he had been billed.

7. Medicaid fraud is a crime of moral turpitude that involves willfully submitting false reports in the practice of medicine.

Conclusions of Law

By clear and convincing evidence, the Board concludes as a matter of law that Respondent committed the following act:

pleads guilty . . . to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; §14-504(6)[3]

By clear and convincing evidence the Board concludes as a matter of law that Respondent did not commit the following acts:

Is . . . convicted . . . by a court of any state or country for an act that would be grounds for disciplinary action under this section; [HO §14-504(22)]

Is guilty of immoral unprofessional conduct in the practice of medicine; [HO §14-504(3)]

Willfully makes or files a false report or record in the practice of medicine; [HO §14-504(12) of Act][4]

Facts as to the Sanction

1. The Respondent testified that he arrived in his present circumstances because, when he was audited

3. In reaching this decision, the Board notes that Respondent's counsel contended that the Criminal Court, by its issuance of probation before judgment overturned Respondent's plea of guilty so that there is no such plea now in existence and the Board, therefore, does not have jurisdiction to sanction Respondent under §14-504(6) which provides, in pertinent part, "is convicted of or pleads guilty or nolo contendere with respect to a crime involved moral turpitude...." The Board adopts the Hearing Officer's conclusion as set forth in the addendum.

4. Respondent was given probation prior to judgment under Article 27, §641. Probation prior to judgment is not a conviction. *Myers v. State*, 303 Md. 639, 496 A.2d 312 (1985); *State v. Shilling*, 75 Md. App. 233, 540 A.2d 1184 (1988). Consequently this charge and the underlying grounds must be dismissed.

and the 20 cases were called to his attention, he sought the advice of counsel. Counsel informed him that he might either make a plea bargain with the State or he might contest the case. If he contested the case, the fee would be in the range of $50,000 to $60,000. If he plea bargained, however, the criminal offense on his record would do him no harm and the Commission on Medical Discipline, which was the predecessor to the present Board, could be accurately predicted to take no action against his license since it never took action against anyone's license in Medicaid Fraud cases, even where the fraud was in excess of a half million dollars. The Respondent accepted the advice of his counsel and entered into a plea bargain without contesting the State's factual allegations whereupon the law promptly changed, a new Board was established, and a new, much firmer policy was instituted with regard to Medicaid Fraud. The Respondent's discussion of his legal tactical situation is believable, but does not either alter the fact that he had pled guilty to Medicaid Fraud.

2. Respondent admitted that he did send requests for Medicaid payment on 20 occasions spread over three years when the patients were repeated "no-shows." The total submittal over three years amounts to $335. Respondent did not fake treatment notes for these occasions but annotated the histories to show that the patients did not keep their appointments.

3. The Respondent has a reputation for being a dedicated, hard working, very competent pediatrician.

The Respondent was portrayed by the witnesses previously identified as being totally dedicated and extremely capable in his practice. He immerses himself in his practice and his family and little else. He is available at all times to his patients. If the telephone rings at a medical conference it is a standing joke that the call is probably for the Respondent. The Respondent was praised in the strongest terms by various kinds of health care professionals and lay witnesses. All perceived him as being uncompromisingly honest, hard working, careful, and caring. None saw him as having any potential for committing a deliberate fraud. Dr. T. Edgie Russell recommended him for his present practice and remains firmly supportive. Other pediatricians and health care providers entrust their children to the Respondent. All witnesses were impressive. All spoke with conviction and believed in their testimony.

4. The Respondent testified on his own behalf and was also believable. Dr. Shin makes well over $100,000 per year and has no need to defraud the government of $335 spread over a three-year period. The facts support his version, that in frustration with persons who were multiple no-shows he sent off these requests for payment feeling that somehow he and his people at least should be compensated for staying the extra hours to try to help people who then did not show and did not have the courtesy to call. Regardless, a case of fraud has been made out; the Respondent's conduct amounts to a serious lapse in judgment resulting in his plea of guilty and the imposition of probation before judgment.

5. The Respondent has made restitution to the Department of Health and Mental Hygiene in the amount in excess of $8,272.50 as directed by the Criminal Court, has paid the Court costs assessed in the amount of $95 and has further paid the fine assessed of $10,000, for a total payment of $18,367.50.

Order

By a majority of the full authorized membership of the Board considering this case, it is this 16th day of January 1990 hereby

ORDERED that Respondent's license is SUSPENDED; and it is further

ORDERED that said suspension is IMMEDIATELY STAYED pending Respondent's compliance with the following condition:

1. That Respondent will indicate in all medical records the reasons for ordering a throat culture; and be it further

ORDERED that on or about June 1, 1991 Respondent will submit to a peer review of his practice to determine if he has met the condition of probation; and be it further

ORDERED that on or about January 16, 1992 Respondent may petition the Board to lift the suspension on his license; and be it further

ORDERED that the following charge and underlying grounds

> Is . . . convicted . . . by a court of any state or country for an act that would be grounds for disciplinary action under this section; [HO §14-504(22)]

Grounds for disciplinary action under this section are:

> Is guilty of immoral or unprofessional conduct in the practice of medicine; [HO §14-504(3)]
>
> Willfully makes or files a false report or record in the practice of medicine; [HO §14-504(12) of the Act]

are DISMISSED; and be it further

ORDERED that this is a final order.

PEER REVIEW MANAGEMENT COMMITTEE

INTRODUCTION

Physician Peer Review is a matter of public policy because the state, as grantor of a license to practice medicine, has a duty to protect the public from being injured or defrauded by unqualified or incompetent physicians.

American courts consistently support the validity of state laws that immunize peer review physicians against liability when acting in good faith.

Physicians should support and perform Peer Review for the following reasons:

(a) disciplinary actions against unqualified or incompetent physicians protect the public and maintain the integrity of the medical profession;

(b) the complexities of medical diagnosis and treatment are best scrutinized by physicians; and

(c) Peer Review has inherent educational value not only for the physician being reviewed, but for the reviewers and the medical community at large.

The state medical society should be exquisitely preoccupied with the notion that Peer Review must be fair, because an unfair appraisal could lead to the revocation of a physician's license, that is, the loss of his livelihood. Assuring that Peer Review findings are fundamentally fair at least requires the following:

(a) the investigations of a responding physician must be by physicians;

(b) medical record review must be conducted by physicians, at least one of whom must be a member of the same specialty;

(c) the responding physician must be afforded the opportunity to be interviewed by the appropriate Peer Review Committee; and

(d) the Peer Review Committee's conclusions and recommendations should be reviewed by a group of physicians (Peer Review Management Committee) who would attest that the conclusions and recommendations are supportable by the available evidence.

BACKGROUND

Role of Peer Review Management Committee (PRMC)

PRMC shall receive cases referred by the Board of Physician Quality Assurance, identify the guidelines to be used in conducting Peer Review, and shall refer cases to the appropriate MED CHI committees, component or specialty society, or regional review committees. The guidelines for referral are enumerated in the Peer Review Handbook approved by Council and adopted by the Board of Physician Quality Assurance.

PRMC shall develop a monitoring procedure that allows the immediate determination of the status of any Peer Review complaint, should insure that review is done in a timely manner and should encourage corrective action to prevent unnecessary delays.

PRMC shall review final reports prepared by Peer Review Committees and should assure that the review and report were conducted and prepared in accordance with the guidelines of the Peer Review Handbook and that the conclusions are supported by the evidence.

When PRMC finds a report to be inadequate in any respect, the inadequacy shall be specifically identified and returned to the committee for further resolution. PRMC will provide organizational assistance to any review committee throughout Maryland and shall gather, analyze and report statistical information annually for use by the Board of Physician Quality Assurance, MED CHI, and component societies.

Medical
and Chirurgical Faculty
of Maryland

PRMC will identify areas in which educational programs will benefit regional review committees, and shall arrange to provide the educational programs. The educational programs will emphasize the need for component medical societies to be involved in Peer Review in some manner, the need for a specialist to be part of the reviewing team, the need to be fair, the need to be timely, the need to assure reasonable conclusions, and the need to be systematic in performing Peer Review.

RECOMMENDATION

1. That the Medical and Chirurgical Faculty of Maryland reaffirms its involvement and essential role in the peer review process; and

2. That the Faculty ensures continued excellence in the peer review process by appropriately funding this activity to allow staffing by qualified individuals.

TEEN PREGNANCY AND INFANT MORTALITY

Summary

The problem of teenage pregnancy and infant mortality remains a major one for the State of Maryland. It is an issue being addressed by our government as well as the private sector. It is extremely important that our State Medical Society get involved in promoting and assisting programs that reduce infant mortality and the role of teenage pregnancy in this mortality.

In 1986 there were 8,143 births to women under age 20. This included 234 births to girls under 15 and 2,956 births to girls 15-17 years of age. About 12 percent of all births in Maryland were to women under 20. Data for 1988 indicate that the number of births to teens is still increasing (8,449).

Teenage mothers have a higher incidence of prematurity in their babies than the average population. In 1983, whereas the percentage of low birth weight babies for all pregnancies was 8.8 percent, for mothers 14 and under, it was 15.2 percent, and for those 15-19, 11.2 percent. Black mothers, in general, have a higher incidence of low birth weight babies than do white mothers. However, in 1983, white mothers 14 and under had a 25 percent low birth weight rate in their newborns.

Infant mortality is also related to the age of the mother. Whereas, in 1979-81 the infant mortality rate in the state was 13.4 per thousand live births, for babies born to mothers under 14, the rate was 37.3 and for those aged 15-19, the rate was 18.9. Therefore, the major issues in regard to infant outcome in teenage pregnancy are those related to prematurity and mortality.

Legislation

In the State of Maryland, both legislative and executive branches have been taking an increasingly more visible look into the problems of teenage pregnancy. The Governor has a Council on adolescent

pregnancy which in 1988 produced a long term plan for addressing this problem. This plan is detailed in the document entitled "Action 90", a copy of which is attached. A newly formed State Advisory Council on Infant Mortality has just begun its work.

Recommended Action

The Faculty should get involved in several ways.

1. Support the plan outlined in "Action 90".

2. Be a strong voice in sex education for young people by supporting educators and becoming resource people to them.

3. Look very closely at the problem of access to care. There are many social and economic reasons for poor access to perinatal and prenatal care experienced by our high risk populations. We may not be able to correct all of these. However, the one that could be best addressed by the Faculty is the issue of accessibility and quality of medical care provided to our poor. The faculty should initiate and/or support funding legislation that makes quality care available.

4. To achieve any of its goals, the Faculty must be cognizant of all the activities going on in Maryland with regard to this problem and be ready and willing to act promptly on issues as they evolve. The cumbersome system that has existed in the past for addressing issues will not work. Too often the time for action has passed by the time issues get endorsed or approved by the Faculty as a whole.

A MESSAGE FOR THE HEARING IMPAIRED

The Resound Hearing Aid, using the technology developed by ATT-Bell Lab and Rodney Perkins, M.D. (Stanford University) is a hearing device of unsurpassed cosmesis and quality. For those who qualify, this device provides superior performance, comfort and acceptance when compared to all the existing electroacoustic devices for the hearing impaired. A digital hearing aid using the Texas Instruments TM 532020 digital signal processor programmed specifically for the hearing aid user to match their individual need.

The device is implanted through a minor recontour surgical procedure of the ear done under local outpatient surgery. Following this the high performance sound processing device is placed deep in the ear canal near the ear drum. The procedure is now being done at Harbor Hospital in Baltimore, Maryland.

The Resound has the ability to compensate for the distortion of sound recruitment common to regular hearing aid users. The Resound adjusts the intensity for each frequency to fit into the individuals comfortable hearing range. Thus, the distortion with high tones of speech, the loss of consonants and indistinctness of speech, the loss of directionality and the wind noise are practically eliminated with the Resound. The programming of the device is done by Dr. Kathryn Copmann, Ph.D. audiologist and the evaluation and implantation is done surgically by Otolaryngologist Lewis B. Newberg, M.D.

To date the patients that have been seen and operated on are all quite satisfied with the quality of sound; and cosmetically were quite surprised and pleased.

In addition to being able to offer the Resound Hearing device, a number of additional services are available including transtympanic and operative electrocochleography for Menieres disease and Audiant bone conduction hearing devices and cochlear implants. A full range of rehabilitative ancillary support are available for those who diagnostically qualify for these procedures.

For further information you may contact: Lewis B. Newberg, M.D.

When You Listen To Your Heart, What Do You Hear?

"So what's a little chest pain? No time for health . . . it's busy, busy business-as-usual. Just get me through the day."

"Hmmm . . . chest discomfort . . . one of the early signs of a heart attack. I'm pretty fit, but still, I'd better have it checked out today."

Disheartening news for procrastinators

There are, at times, two people inside most of us: the one who says, "Aw, don't worry". . . and the one who says, "take action right away." Which do you obey? So often, in everyday matters, we program ourselves to ignore symptoms because we have learned that most of the time these symptoms go away. We listen to our lazy, procrastinating self . . . and end up "killing time." But in matters of the heart . . . heart attack . . . killing time can kill **you**. *This overkill allows heart disease to be the number one killer of the adult population in the United States today.*

When it comes to heart attack, timing is everything . . . it can mean the difference between life and death. That's because the time of one's electrocution (sudden cardiac death) and the time that one loses the cardiac pump is directly related to the time lost when meaningful chest discomfort begins. If action is taken promptly—in the beginning stages of a heart attack—maximal benefits from early cardiac care can occur. So if you experience chest pain or chest discomfort, seek immediate medical attention.

Free VCR tapes are available on how to set up early cardiac care in your hospital's emergency room and network with the community using an educational heart attack outreach program. Call **(301) 368-3217,** or write to Dr. Raymond D. Bahr.

The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative *Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf -- so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton. Call your independent insurance agent today.

Maryland Physicians: Thanks To You, It Works.

The history of Medical Mutual is really the story of physicians working together to surmount complex problems which had defeated others. Through cooperation, persistence and the strength to make difficult decisions, the physicians of Maryland have set an example for the rest of the country.

It all began, of course, in 1975 when the major medical malpractice insurers announced they were leaving Maryland. Spiraling malpractice awards and the prospect of large-scale losses, the companies said, made it impossible to do business in Maryland. As the potential threat to public health became evident, many people feared that health care delivery in the State was on the verge of collapse.

With no relief in sight, physicians, citizens, and the General Assembly worked together to create what had never before existed anywhere — a medical professional liability insurance company owned and directed by its physician members. On June 3, 1975, Medical Mutual was created.

Over the past 15 years, other companies have come, and gone, and come again — entering Maryland when there were profits to be carried away, and leaving whenever times got tough. Through it all, Medical Mutual's physicians have proved that their long-term commitment was the right choice.

For 15 years, our thousands of physician members have been at the heart of what we are, and we are unique because of your needs, your insight, and your guidance.

The success we have earned was by no means universally predicted in 1975. But we survived those difficult first years, and now, 15 years later, we are proof of what physicians can do when they work together for a common goal.

Thanks to you, it works.

Look At Luxury.

In Silver Spring From the $330's

It's almost too good to be true . . . A community of Richmarr's finest homes, in a richly wooded setting. Moments from three major shopping centers. Across the road from Wheaton Regional Park and Brookside Gardens. Just a few reasons why an entire section of these fabulous homes sold prior to opening!

Now you can see the dazzling elevations, impressive entry foyers, some with spiral staircases, country kitchens with breakfast rooms and pantries, spectacular great rooms with fireplaces, elegant libraries and master suites. To visit our furnished models, from I-495, take Georgia Avenue Exit North to Randolph Rd., right on Randolph, 1.7 miles to Doral on left. Open daily 12-6. Phone: 622-9586. Richmarr Construction Corporation
Brokers warmly welcomed.

Doral

Look At Richmarr.

We are pledged to the letter and spirit of U.S. policy for the achievement of equal housing opportunity throughout the Nation. We encourage and support an affirmative advertising and marketing program in which there are no barriers to obtaining housing because of race, color, religion, sex, handicap, familial status, or national origin.

Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

ARTICLES

St. Agnes: A Community Teaching Hospital 547
Francis J. Viozzi MD

Rehabilitation of Cardiac Outpatients: A Community Hospital Experience in the 1980s 549
Ronald Gillilan MD; Katharine Beasley RN, BS; Elizabeth Booth RN, BSN; Annette DeAngelis; J. Richard Warbasse MD; and Stephen Plantholt MD
St. Agnes Hospital's decade of experience with outpatient rehabilitation of coronary heart disease patients shows that exercise conditioning plays an important role in their return to strenuous work.

White-Coat Hypertension: Detection and Evaluation 555
Jack Long DSW, Ronald Gillilan MD, Soo Gil Lee MD, Choong R. Kim MD, and Stephen Plantholt MD
A comparison of subjects' blood pressures during office, ambulatory, and psychophysiological stress tests suggests further research is needed to better understand the importance of such testing on white-coat and fixed hypertensive patients.

Thrombolytic Therapy in MI: A Retrospective Study 561
Raul Balagtas MD, Juan Herrada MD, and Raymond Bahr MD
There is a clear need for patient education and public awareness of prodromal symptoms and early intervention.

Relevance of Routine Operative Cholangiograms and Modifications in Criteria for Selective Use 565
Dinesh Ranjan MD, Udayan B. Shah MD, and Thomas R. Molano MD
Reviewing 367 patients undergoing cholecystectomy over one year showed that routine use of operative cholangiograms is unwarranted and may be harmful.

Use of Fetal-Weight Formulae in a Community Hospital 571
James Castellano MD, Marlene Eichner RDMS, John D. Dumler MD, and Pedro P. Arrabal MD
Twelve formulae for estimating fetal weight were prospectively studied in the hope that one could be used on a patient population regardless of complications.

Hospital Donation of Eye Tissue: The Physician's Vital Role 597
Richard M. Susel MD, FACS
Physicians' identification of potential donor families is the heart of a successful hospital tissue recovery program.

Case Report: Adult Scurvy 577
Anand P. Jillella MD; Eugene T. Finan MD; Zahid W. Butt MD; Mary E. Wright RD, LD; and David Strobel MD
Adult scurvy, a rare condition the US, often is not recognized because of its rarity and diverse clinical manifestations.

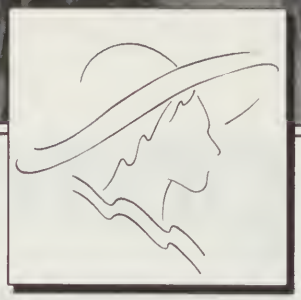
We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.



To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

DRS. SCHULTZE, SNIDER & ASSOCIATES P. A.
PROUDLY ANNOUNCES THE OPENING OF OUR

Mammography AND Ultrasound Center

AT MCDONOGH CROSSROADS
23 CROSSROADS DRIVE, SUITE 205
OWINGS MILLS, MD 21117
363-0767

Dr. Joan E. Berkowitz • Director of Mammography Services

Low Dose Mammography • Ultrasound • Cyst Aspiration • Breast Needle Localization • Mammography Review and Consultation

DRS. SCHULTZE, SNIDER & ASSOCIATES, P.A.
RADIOLOGISTS

Radiology Services Also Available at The Following Locations:

Lutherville/Towson
1205 York Road
296-6222

Timonium
MRI Center
7 W. Ridgely Road
561-4MRI

Greenspring/Pimlico
Professional Building and Imaging Center
3901 Greenspring Avenue
462-6700

Govans
5820 York Road
435-2155

Homewood
South Professional Building
33rd and Calvert Streets
467-1905

Opening Summer 1990:

Owings Mills
Imaging Center at McDonogh Crossroads
21 Crossroads Drive
363-6677

Greenspring/Pimlico
The Krieger Building (at Sinai Hospital)
2401 W. Belvedere Avenue
367-8588

The Sinai Hospital of Baltimore, Union Memorial Hospital and The Children's Hospital & Center for Reconstructive Surgery

William Donald Schaefer - Governor of Maryland

June, 1990
Protection Against Viral Hepatitis B

The following information was taken from
Protection Against Viral Hepatitis: Recommendations of the Immunization Practices Advisory Committee (ACIP), published in the Morbidity and Mortality Weekly Report, Recommendations and Reports, February 9, 1990.

Hepatitis B Vaccine and Usage

Two types of hepatitis B vaccines are currently licensed in the U.S.: plasma-derived and recombinant hepatitis B vaccines. The recommended series of three intramuscular doses of hepatitis B vaccine induces an adequate antibody response ($\geq$10 milliInternational Units per ml) in 90% of healthy adults and in 95% of infants, children, and adolescents from birth through 19 years of age. The deltoid (arm) is the recommended site for vaccination of adults and children. The anterolateral thigh muscle is used for infants and neonates. Dosages and schedules for currently available vaccines are listed in Table 1. For patients undergoing hemodialysis or for other immunosuppressed patients, higher doses or increased numbers of doses are required. Persons with HIV infection have an impaired response to hepatitis B vaccine. The immunogenicity of higher doses of vaccine is unknown for this group, and firm recommendations on dosage cannot be made at this time.

Vaccine doses administered at longer intervals provide equally satisfactory protection, but optimal protection is not conferred until after the third dose. If the vaccine series is interrupted after the first dose, the second and third doses should be given separated by an interval of 3-5 months. Persons who are late for the third dose should be given this dose when convenient. Postvaccination testing is not considered necessary

Neither pregnancy nor lactation is a contraindication to the use of the vaccine for women who are otherwise eligible.

Postvaccination testing for serologic response is not recommended routinely but is advised for persons whose subsequent management depends on knowing their immune status or for persons who may have a suboptimal response (those who received vaccine in the buttock, persons $\geq$50 years of age, and persons with HIV infection). Postvaccination testing should be done between 1 and 6 months after completion of the vaccine series.

For adults and children with normal immune status, booster doses are not routinely recommended within 7 years after vaccination, nor is routine serologic testing to assess antibody levels necessary for vaccine recipients during this period. For infants born to hepatitis B carrier mothers, booster doses are not necessary within 5 years after vaccination. The possible need for booster doses after longer intervals will be assessed as additional information becomes available.

TABLE 1. Recommended doses and schedules of currently licensed HB vaccines

Group	Vaccine					
	Heptavax-B*,†		Recombivax HB*		Engerix-B*§	
	Dose (μg)	(ml)	Dose (μg)	(ml)	Dose (μg)	(ml)
Infants of HBV-carrier mothers	10	(0.5)	5	(0.5)	10	(0.5)
Other infants and children <11 years	10	(0.5)	2.5	(0.25)	10	(0.5)
Children and adolescents 11-19 years	20	(1.0)	5	(0.5)	20	(1.0)
Adults >19 years	20	(1.0)	10	(1.0)	20	(1.0)
Dialysis patients and other immunocompromised persons	40	(2.0)¶	40	(1.0)**	40	(2.0)¶,††

*Usual schedule: three doses at 0, 1, 6 months.
†Available only for hemodialysis and other immunocompromised patients and for persons with known allergy to yeast.
§Alternative schedule: four doses at 0, 1, 2, 12 months.
¶Two 1.0-ml doses given at different sites.
**Special formulation for dialysis patients.
††Four-dose schedule recommended at 0, 1, 2, 6 months.

Groups recommended for preexposure vaccination:

1. Persons with occupational risk;
2. Clients and staff of institutions for the developmentally disabled;
3. Hemodialysis patients;
4. Sexually active homosexual men;
5. Users of illicit injectable drugs;
6. Recipients of certain blood products, such as persons with clotting disorders;
7. Household and sexual contacts of hepatitis B virus (HBV) carriers;

8. Adoptees from countries of high HBV endemicity;
9. Other contacts of HBV carriers (such as when the carrier has behavioral (biting or scratching) problems or medical conditions (severe skin disease) that might facilitate transmission;
10. Populations with high endemicity of HBV infection;
11. Inmates of long-term correctional facilities;
12. Sexually active heterosexual persons with multiple sexual partners; and
13. International travelers who plan to reside for more than 6 months in areas with high levels of endemic HBV and who will have close contact with the local populations.

Postexposure Prophylaxis for Hepatitis B

Prophylactic treatment to prevent hepatitis B infection after exposure to HBV should be considered in the following situations: perinatal exposure of an infant born to an HBsAg-positive mother, accidental percutaneous or permucosal exposure to HBsAg-positive blood, sexual exposure to an HBsAg-positive person, and household exposure of an infant < 12 months of age to a primary care giver who has acute hepatitis B.

For an infant with perinatal exposure to an HBsAg-positive and HBeAg-positive mother, a regimen combining one dose of Hepatitis B Immune Globulin (HBIG) at birth with the hepatitis B vaccine series started soon after birth is 85%-95% effective in preventing development of the HBV carrier state. Regimens involving either multiple doses of HBIG alone, or the vaccine series alone, have 70%-85% efficacy.

For accidental percutaneous exposure, only regimens including HBIG and/or immune globulin (IG) have been studied. A regimen of two doses of HBIG, one given after exposure and one a month later, is about 75% effective in preventing hepatitis B in this setting. For sexual exposure, a single dose of HBIG is 75% effective if given within 2 weeks of last sexual exposure. The efficacy of IG for postexposure prophylaxis is uncertain. IG no longer has a role in postexposure prophylaxis of hepatitis B because of the availability of HBIG and the wider use of hepatitis B vaccine.

TABLE 2. Hepatitis B virus postexposure recommendations

	HBIG		Vaccine	
Exposure	Dose	Recommended timing	Dose	Recommended timing
Perinatal	0.5 ml IM	Within 12 hours of birth	0.5 ml IM*	Within 12 hours of birth†
Sexual	0.06 ml/kg IM	Single dose within 14 days of last sexual contact	1.0 ml IM*	First dose at time of HBIG treatment†

*For appropriate age-specific doses of each vaccine, see Table 3.
†The first dose can be given the same time as the HBIG dose but in a different site; subsequent doses should be given as recommended for specific vaccine.

In all exposures, a regimen combining HBIG with hepatitis B vaccine will provide both short and long-term protection, will be less costly than the two-dose HBIG treatment alone, and is the treatment of choice.

Perinatal Exposure and Recommendations

Infants born to HBsAg-positive and HBeAg-positive mothers have a 70%-90% chance of acquiring perinatal HBV infection, and 85%-90% of infected infants will become chronic HBV carriers. Estimates are that 25% of these carriers will die from primary hepatocellular carcinoma (PHC) or cirrhosis of the liver. Infants born to HBsAg-positive and HBeAg-negative mothers have a lower risk of acquiring perinatal infection; however, such infants have had acute disease, and fatal fulminant hepatitis has been reported. Prenatal screening of all pregnant women identifies those who are HBsAg-positive and allows treatment of their newborns with HBIG and hepatitis B vaccine, a regimen that is 85%-95% effective in preventing the development of the HBV chronic carrier state.

Recommendations:

1. All pregnant women should be routinely tested for HBsAg during an early prenatal visit in each pregnancy. This testing should be done at the same time that other routine prenatal screening tests are ordered. In special situations , an additional HBsAg test can be ordered later in the pregnancy. No other HBV marker tests are necessary for the purpose of maternal screening, although HBsAg-positive mothers identified during screening may have HBV-related acute or chronic liver disease and should be evaluated by their physicians.

2. If a woman has not been screened prenatally or if test results are not available at the time of admission for delivery, HBsAg testing should be done at the time of admission, or as soon as possible thereafter. If the mother is identified as HBsAg-positive 1 month after giving birth, the infant should be tested for HBsAg. If the results are negative, the infant should be given HBIG and hepatitis B vaccine.

3. Following all initial positive tests for HBsAg, a repeat test for HBsAg should be performed on the same specimen, followed by a confirmatory test using a neutralization assay. For women in labor who did not have HBsAg testing during pregnancy and who are found to be HBsAg-positive on first testing, initiation of treatment of their infants should not be delayed by more than 24 hours for repeat or confirmatory testing.

4. Infants born to HBsAg-positive mothers should receive HBIG (0.5 ml) intramuscularly once they are physiologically stable, preferably within 12 hours of birth (Table 2). The first dose should be given concurrently with HBIG but at a different site. If vaccine is not immediately available, the first dose should be given as soon as possible. Subsequent doses should be given as recommended for the specific vaccine. Testing infants for HBsAg and anti-HBs is recommended when they are 12-15 months of age to

monitor the success or failure of therapy. If HBsAg is not detectable and anti-HBs is present, children can be considered protected. Testing for anti-HBc is not useful, since maternal anti-HBc can persist for 1 year. HBIG and hepatitis B vaccination do not interfere with routine childhood vaccinations. Breast-feeding poses no risk of HBV infection for infants who have begun prophylaxis.

5. Household members and sexual partners of HBV carriers identified through prenatal screening should be tested to determine susceptibility to HBV infection, and, if susceptible, should receive hepatitis B vaccine.

6. Obstetric and pediatric staff should be notified directly about HBsAg-positive mothers so that neonates can receive therapy without delay after birth and follow-up doses of vaccine can be given.

7. In those populations under U.S. jurisdiction in which hepatitis B infection is highly endemic (including certain Alaskan Natives, Pacific Island groups, and refugees from highly endemic areas accepted for resettlement in the United States), universal vaccination of newborns with hepatitis B vaccine is the recommended strategy for hepatitis B control. HBsAg screening of mothers and use of HBIG for infants born to HBV-carrier mothers may be added to routine hepatitis B vaccination when practical, but screening and HBIG alone will not adequately protect children from HBV infection in endemic areas. In such areas, hepatitis B vaccine doses should be integrated into the childhood vaccination schedule. More extensive programs of childhood hepatitis B vaccination should be considered if resources are available.

Acute Exposure to Blood That Contains (or Might Contain) HBsAg

For accidental percutaneous (needle stick, laceration, or bite) or permucosal (ocular or mucous-membrane) exposure to blood, the decision to provide prophylaxis must include consideration of several factors: a) whether the source of the blood is available, b) the HBsAg status of the source, and c) the hepatitis B vaccination and vaccine-response status of the exposed person. Such exposures usually affect persons for whom hepatitis B vaccine is recommended. For any exposure of a person not previously vaccinated, hepatitis B vaccination is recommended.

Following any such exposure, a blood sample should be obtained from the person who was the source of the exposure and should be tested for HBsAg. The hepatitis B vaccination status and anti-HBs response status (if known) of the exposed person should be reviewed. The outline below and Table 3 summarize prophylaxis for percutaneous or permucosal exposure to blood according to the HBsAg status of the source of exposure and the vaccination status and vaccine response of the exposed person.

For greatest effectiveness, passive prophylaxis with HBIG, when indicated, should be given as soon as possible after exposure (its value beyond 7 days after exposure is unclear).

1. Source of exposure HBsAg-positive
